Descriptors: *Phosphorus, Kinetics, *Absorption, *Sorption, Retention, *Algae, *Bacteria, *Tubificids, Water pollution, Radioactivity, Radioactive tracer, Equilibrium, Worms, Ecology, Ecosystems.

Kinetics of accumulation and retention of P-32 were determined for unialgal cultures of Chlorella pyrenoidosa in carrier (52 mg Na2HPO4/liter) and carrier-free Knop's solution (modified) using 10 micron Ci P32/liter as tracer and a Geiger-Mueller counting system. Accumulation in a carrier-free solution was exponential and approached a 90% efficiency of removal within 30 min. In the carrier solution, accumulation was approximately linear and did not reach equilibrium within a 27-hr period. Using ouabain as an inhibitor, it was shown that the observed sorption of radiophosphate in carrier-free solution by this alga was independent of metabolic activity. Most loss of the phosphate taken up in a 27 -hr interval occurred within 1 hr in agitated carrier and carrier-free Knop's solution. Accumulation of P-32 by tubificid worms was also studied using similar counting methods. Uptake by these worms was approximately exponential in media with a bacterial source of radiophosphate, and was reduced by addition of chloramphenicol and removal of P-32 from solution by algae. Preliminary results indicated that C. pyrenoidosa competed effectively with the worms for inorganic phosphate, and that accumulation of P-32 by ingestion of algae among tubificids may be slight. Ecological implications of these results are discussed. (See also W74-05181) (Houser-ORNL)

UPTAKE OF RADIOPHOSPHORUS BY ROOTED AQUATIC PLANTS,
Pacific Northwest Water Lab., Corvallis, Oreg.
D. W. Schults, and K. W. Malueg.
In: CONF-710501-P1 - Proceedings of the Third National Symposium on Radioecology, May 10-12, 1971, Oak Ridge, Tenn. p 417-424, (1971), 5 fig, 4 tab, 9 ref.

Descriptors: *Water pollution effects, *Lakes, *Radioisotopes, *Phosphorus, *Absorption, Ion exchange, Root system, Aquatic plants, Water, Sediments, Leaves, Silica, Sands, Transfer, Kinetics.
Identifiers: *Radiophosphorus, Sediment-water nutrient interchange.

Laboratory experiments were conducted to compare the uptake of phosphorus by roots and foliage of Elodea canadensis, Potamogeton amplifolius, and Vallisneria americana and to evaluate the cycling of radiophosphorus between the sediment and the water medium with the plant as the exchange agent. Intact plants were partitioned into root and foliage environments. For the comparison the radiophosphorus isotopes P-32 and P-33 were used simultaneously in the separate environments. Three different root media were evaluated for their influence on phosphorus uptake by the plants: lake water, silica sand saturated with lake water, and lake sediment saturated with lake water. All three species had higher uptake by the foliage than by the roots. For Potamogeton and Vallisneria, uptake by the foliage was greatest for plants rooted in sediment, less for those rooted in sand, and least for those rooted in lake water. For Elodea, uptake by the foliage was not statistically different for the three rooting media. For all experiments, except Vallisneria rooted in sand, there was a direct positive relationship between total uptake and percentage of radiophosphorus derived from the rooting medium. Only about 1% of the radiophosphorus in the foliage medium was transferred downward to the root medium. Up to 54% of the radiophosphorus added to the root medium was transferred through the plant and into the foliage medium. This process may constitute a significant sediment-water nutrient interchange mechanism in the littoral regions of lakes. (See also W74-05181) (Houser-ORNL)

STRONTIUM-90 AND CESIUM-137 IN WATER AND DEEP SEDIMENTS OF THE GREAT LAKES,
Department of the Environment, Burlington (Ontario). Centre for Inland Waters.
A. Lerman, and H. Taniguchi.
In: CONF-710501-P1 - Proceedings of the Third National Symposium on Radioecology, May 10-12, 1971, Oak Ridge, Tenn. p 460-464, (1971), 1 fig, 5 tab, 14 ref.

Descriptors: *Fallout, *Strontium, *Cesium, *Lake sediments, *Great Lakes, *Radioactivity, Lake Ontario, Lake Superior, *Assay, Watersheds(Basins), Sedimentology, Deposition(Sediments), Lake Michigan, Lake Huron, Lake Erie, Transfer, Discharge, Movement, Precipitation(Atmospheric).

Input of Sr-90 into the Laurentian Great Lakes was estimated from the rates of deposition of nuclear fallout in atmospheric precipitation over the lake surface and land drainage basin of each lake, for the period 1954-69. The amount of Sr-90 accumulated in the sediments of Lakes Superior, Michigan, and Ontario is only a small fraction (2-6%) of the total amount introduced into the lakes. The amount of Cs-137 in sediment cores from Lakes Ontario and Superior is 20-35 times greater than the amount of Sr-90. These high concentrations of Cs-137, viewed against the value of 1.45 for the Cs-137/Sr-90 ratio in atmospheric fallout and 0.16-0.36 in the Great Lakes waters, indicate that Great Lakes sediments strongly control the concentration of Cs-137 in lake water. CHANGES IN MORPHOLOGICAL COMPOSITION OF THE BLOOD OF LARVAL FISH BITTEN BY WATER BUGS FAM. CORIXIDAE), (IN RUSSIAN),
L. D. Zhiteneva, and N. P. Sokol' skaya.
Vopr Ikhtiol. Vol 12, No 1, p 179-185. 1972. Illus.
Identifiers: *Corxidae, Erythrocyte, Fish morphology, Hemolysis, Larval fish, *Water bugs, Fish blood, *Corp, *Sterlet, Fish pathology, Fish parasites, *Fish poisons.

Blood changes in larvae of 3 different species of fish (pond carp, grass carp and sterlet) following a

bite by water bugs were investigated. The poison of these fish parasites produces a degradation of erythrocytes, and hemolysis. Pathological changes include changes in white blood cells, production of many immature lympho- and leukoblasts. These irreversible processes lead to death of the fish. The most sensitive to the bite are the sterlets.--Copyright 1973, Biological Abstracts, Inc.

UPTAKE OF MOLYBDENUM MARKED WITH MO-99, BY THE BIOTA OF FERN LAKE, WASHINGTON, IN A LABORATORY AND FIELD EXPERIMENT,
Washington Univ., Seattle. Coll. of Fisheries.
Z. F. Short, P. R. Olson, R. F. Palumbo, J. R. Donaldson, and F. G. Lowman.
In: CONF-710501-P1 - Proceedings of the Third National Symposium on Radioecology, May 10-12, 1971, Oak Ridge, Tenn. p 474-485, (1971), 7 fig, 5 tab, 39 ref.

Descriptors: *Radioisotopes, *Molybdenum, *Lakes, Ecosystems, *Radioecology, *Washington, Crayfish, Periphyton, Aquatic environment, Food chains, Trout, Clams, Absorption, Transfer, Nutrient requirement.
Identifiers: *Fern Lake(Wash.).

The bioaccumulation of molybdenum, marked with Mo-99, was followed in month-long studies in an aquarium, where water, not food, was the major source of the nuclides, and in Fern Lake, where assimilation by organisms isolated in live-boxes was compared with assimilation by those with access to their usual sources of food. In the aquarium containing 3.3 ppm of the metal, the alga Nitella flexilis accumulated up to 130 ppm molybdenum, a 'luxury' amount. In Fern Lake, with 0.014 ppb, the maximum concentration in the N. flexilis was 8.8 ppb. Uptake in the lake was irregular because of local chemical conditions in the water. The concentration in periphyton from the lake shore-line reached 50 ppb. All the tissues dissected from clams, crayfish, and trout, in the aquarium contained some molybdenum. In trout the least amounts were in the gastrointestinal tract. In the lake, small amounts were in a few trout held without food in the live-boxes, but concentrations were upto 16 ppb in the gastrointestinal tract and liver of fish which were free to feed. The concentrations in the liver of fingerlings exceeded that in the yearlings by a factor of 4. (See also W74-05181) (Houser-ORNL)

EFFECT OF ORGANIC INSECTICIDES UPON CARBON-14 UPTAKE BY FRESHWATER PHYTOPLANKTON,
Florida Technological Univ., Orlando. Dept. of Biological Sciences.
D. H. Vickers, and C. E. Boyd.
In: CONF-710501-P1-Proceedings of the Third National Symposium on Radioecology, May 10-12, (1971), Oak Ridge, Tenn. p492-496, 1971, 4 fig, 1 tab, 8 ref.

Descriptors: *Organic pesticides, *Carbon radioisotopes, *Absorption, Freshwater, *Phytoplankton, Effects, Measurement, Bioassay, Chlorophyll, Ecosystems, *Water pollution effects, *Insecticides.

The effect of ten organic insecticides upon carbon dioxide fixation by phytoplankton was measured in situ by the C-14 bioassay technique. The following insecticides were tested individually at concentrations of 10 ppm: dieldrin, endrin, DDT, toxaphene, malathion, methyl parathion, mirex, sevin, metacil, and furadan. Only the carbamates (sevin, matacil, and furadan) and toxaphene consistently inhibited C-14 uptake under the test conditions. Further tests with the carbamates revealed that concentrations of 3 to 5 ppm of sevin and matacil resulted in about 50% reduction of C-14 uptake as compared with C-14 uptake by the control. Concentrations of 15 ppm of these two compounds almost completely inhibited C-14 uptake. A similar response curve was obtained for furadan, but C-14 uptake was reduced by only 60% at 15 ppm of this insecticide. The carbamate compounds greatly reduced concentrations of chlorophyll A in phytoplankton cultures within 24 hr. (See also W74-05181) (Houser-ORNL)

SOME ECOLOGICAL CONSIDERATIONS IN LOCATING A NUCLEAR-POWERED ELECTRICAL GENERATING FACILITY ON THE NORTH ANNA RIVER, VIRGINIA,
Virginia Commonwealth Univ., Richmond.
G. M. Simmons, Jr., and J. R. Reed, Jr.
In: CONF-710501-p1-Proceedings of the Third National Symposium on Radioecology, May 10-12, 1971, Oak Ridg,e Tennessee. p 497-510, (1971) 15 fig, 5 tab, 10 ref.

Descriptors: *Water pollution effects, *Aquatic environment, Rivers, *Ecosystems, *Virginia, Nuclear powerplants, Lake impoundments, Reservoir storage, Reservoir releases, Direct benefits, Real benefits, Induced benefits, Ecology.
Identifiers: *North Anna River(Va.).

The North Anna River is a major tributary of the York River, which empties into the Chesapeake Bay. The ecological properties of a major portion of the North Anna River have been severely altered by more than 100 years of acid drainage from abandoned iron pyrite mines. Virginia Electric and Power Company is constructing a 13,000-acre impoundment within the disturbed area to provide cooling water for a 4,000,000-kW nuclear-powered electrical generating facility. Results from a preimpoundment study and inspection of the proposed reservoir construction and operation indicate that the facility will have a beneficial effect on the ecological properties of the lower North Anna River basin by accelerating the rate of recovery in the river below the dam. INFLUENCE OF WATER INTAKE ON THE DEGREE OF INCISOR FLUOROSIS AND ON THE INCORPORATION OF FLUORIDE INTO BONES AND INCISOR TEETH OF MICE,
Institute of Dental Research, Prague (Czechoslovakia).
J. A. Ruzicka, L. Mrklas, and K. Rokytova.
Caries Res. Vol 7, No 2, p 166-172, 1973. Illus.
Identifiers: Bones, *Caries, *Fluoride, *Fluorosis(Incisor), *Mice, Teeth, Tibial, Potable water.

Mice were given sodium fluoride solutions to drink in various concentrations and in various daily doses for a period of 200 days. At the end of experiment, both the fluoride content and the degree of fluorosis of the incisor teeth depended only on the concentration of fluoride in the administered solutions. The total daily fluoride intake was without effect. Both fluoride concentration in the drinking water and the total daily intake of fluoride produced effects in the tibia even after 220 days of experiment. This was caused by a great proportion of the bone which was not available to fluoride exchange while the unavailable bone conserved the state existing earlier. The importance of these results for dental caries prevention is discussed. The administration of fluoride in the form of fluoridated drinking water appears to be most advantageous.--Copyright 1973, Biological Abstracts, Inc.

THE ULTRASTRUCTURE OF AN ALLOPARASITIC RED ALGA CHOREOCOLAX POLYSIPHONIAE,
Colorado State Univ., Fort Collins. Dept. of Botany and Plant Pathology.
P. Kugrens, and J. A. West.
Phycologia, Vol 12, Nos 3/4, p 175-186, December 1973. 12 fig, 19 ref.

Descriptors: *Rhodophyta, *Parasitism.
Identifiers: *Ultrastructure, *Choreocolax polysiphoniae.

An alloparasite, Choreocolax polysiphoniae, apparently represents one of the most evolved parasitic red algae. Chloroplasts are highly reduced and consist of double membrane limited organelles lacking any internal thylakoid development. The uninucleate cells have thick walls, an absence of starch in cortical cells and large quantities of starch in medullary cells. Host-parasite concentrations are made by typical red algal pit connections. General effects of the infection on the host include cell hypertrophy, decrease in floridean starch granules, dispersed cytoplasmic matrices, and contorsion of chloroplasts. (Little-Battelle)

Identifiers: Gracilaria compressa, Green light, White light, Sunlight, Phycoerythrin, Carotenoids, Adriatic Sea, Sample preparation, Chlorophyll a, Carotene, Zeaxanthin, Lutein, Biliprotein.

The effects of green and white light at different intensities upon photosynthetic rates of Gracilaria compressa and their relationships to different pigment contents are reported. This is a typical rhodophycean alga, with adaptation to light intensity in the fronds of individual plants. In fact, the green distal portion which is exposed to direct sunlight (within a depth of a few meters), lacks phycoerythrin and shows a great proportion of carotenoids. The red proximal portion, which receives less light as a result of self-shading,

synthesizes phycoerythrin and more chlorophyll. The photosynthetic activity in the two portions, assayed under different light conditions, indicates that the abundant oxygen output in the basal red part of the thallus, also at low light intensity, may be due to a high content of photosynthetic pigments. Conversely, the absence of phycoerythrin and lower chlorophyll content in the distal yellow-green part permits a reasonable photosynthetic rate only at higher light intensity. This is especially apparent in green light: at 250 lux no photosynthetic activity is to be seen in the yellow-green thallus, while the red portion reaches the compensation point. (Mortland-Battelle)

SPATIAL VARIABILITY OF THE PRODUCTIVITY: BIOMASS RATIO FOR PHYTOPLANKTON IN A SMALL MARINE BASIN,
Bedford Inst., Dartmouth (Nova Scotia).
T. Platt, and C. Filion.
Limnology and Oceanography, Vol 18, No 5, p 743-749, September 1973. 1 fig, 3 tab, 20 ref.

Descriptors: *Phytoplankton, *Primary productivity, *Biomass, *On-site tests, Habitats, Homogeneity, Variability, Spatial distribution, *Canada, Water sampling, Sea water, Chlorophyll, Radioactivity techniques, Incubation, Statistical methods, Light, Photosynthesis.
Identifiers: Contemporaneous disequillibrium, Sample preparation, Dark bottle tests, Analysis of variance, Light bottle tests, Data interpretation, Errors, *Bedford basin(N.S.).

The productivity:biomass (P:B) ratio for phytoplankton was studied using a replicated sampling design at six stations in a small marine basin. On six out of ten sampling days, statistically significant differences were revealed in the P:B ratios between stations. This result is consistent with the concept of contemporaneous disequilibrium which emphasizes the spatial component of the heterogeneity of the phytoplankton habitat. The measurements were made in the Bedford Basin, Nova Scotia. Six sampling stations were used. On each of 10 sampling days, each station was visited and 15 liters of seawater collected from 5-m depth. The water from each station was stored in a separate carboy. When water had been gathered from all six stations, each carboy was shaken thoroughly and the following samples drawn off: six replicate 1-liter samples for chlorophyll analysis; six replicate light bottles and four replicate dark bottles for C-14-uptake measurement. All of the replicates for C-14-uptake measurement, a total of 60, were incubated at station 1 at 5-m depth. The in situ incubation of the C-14-uptake experiments lasted 4 hr. Chlorophyll was used as an index of phytoplankton biomass. An analysis of variance design permitted calculation of the standard errors of chlorophyll and C-14 uptake in the light and dark. Using these, the standard errors of the P:B ratios were calculated and compared between stations on the same day. (Mortland-Battelle)

BREEDING AND GROWTH OF THE CHAETOGNATH SAGITTA ELEGANS IN BEDFORD BASIN,
Dalhousie Univ., Halifax (Nova Scotia). Inst. of Oceanography.
A. Zo.
Limnology and Oceanography, Vol 18, No 5, p 750-756, September 1973. 5 fig, 2 tab, 20 ref.

Descriptors: *Breeding, *Growth rates, Worms, Sea water, Water sampling, Water temperature, *Canada, Reproduction, Secondary productivity, Respiration, Life cycles.
Identifiers: *Sagitta elegans, Chaetognaths, Sample preservation, Bedford Basin(N.S.), Macroinvertebrates.

This work was an attempt to examine a complete cycle of breeding and growth of Sagitta elegans Verrill, the only chaetognath found in Bedford Basin. Bedford Basin is an oval-shaped depression about 7 km long and 4 km wide with a maximum depth of 70 m. It is connected to the coastal water of Nova Scotia through a southeastern channel. A collection was taken every 2 weeks during daylight hours from 6 November 1967 to 21 February 1969 at a single station in the deepest part of Bedford Basin (depth 68 m, tidal range plus or minus 2 m). Samples were preserved immediately in an 8 percent Formalin-seawater solution. In the laboratory, counting, measuring, and stage separation were carried out under the microscope, usually on the day following collection. Within 1 year two generations of Sagitta elegans were found. The spring generation, reaching maturity of mid-September, reproduced during the remainder of the year. The autumn generation, consisting of the offspring of the spring generation, appeared to overwinter and established the spring adult population. The temperature-size relationship of S. elegans from Bedford Basin is in close agreement with McLaren's curve for this species in the eastern Canadian Arctic. Net carbon production rate, calculated from the spring generation, was highest in mid-September when the majority of the population approached maturity. (Mortland-Battelle)

DAPHNIA DISTRIBUTION WITHIN LANGMUIR CIRCULATIONS,
Freshwater Biological Association, Windermere (England).
D. G. George, and R. W. Edwards.
Limnology and Oceanography, Vol 18, No 5, p 798-800, September 1973. 2 fig, 9 ref.

Descriptors: *Daphnia, *Distribution patterns, Light intensity, Winds, Reservoirs, Sampling, *Eutrophication, Water pollution effects.
Identifiers: *Langmuir circulations, Daphnia hyalina, Foamlines, Macroinvertebrates, Vertical distribution.

Crustacean zooplankton distribution was studied in Eglwys Nynydd, a eutrophic reservoir near Port Talbot, S. Wales. The reservoir is exposed to the prevailing winds blowing in from the sea and never stratifies thermally. Daphnia hyalina var. lacustris (Sars) dominates the zooplankton, both numerically and in terms of biomass, throughout the year. Studies of the vertical distribution of the species collected over 2 years have shown that the animals tend to avoid the surface waters in daylight. Continuous horizontal samples of zooplankton were taken with a self-priming pump (30 liters/min capacity) connected to a sectional intake boom installed on a small boat. When used to examine distributions within Langmuir spirals the intake boom was positioned just below the surface (10-30 cm) and run first along, and then midway between, well-defined foamlines. Water was pumped directly into 2-liter containers in the boat for subsequent filtration on shore and all the Daphnia in each sample were counted. Daphnia hyalina was concentrated near the surface midway between the foamlines of Langmuir circulations that developed in a shallow reservoir at wind speeds above 400 cm/sec. Such concentration was probably caused by the antagonistic factors of upward water transport carrying D. hyalina to the surface zone and oriented movements away from this region of high light intensity. (Mortland-Battelle)

EFFECTS OF RED MUD ON MARINE ANIMALS,
Ministry of Agriculture, Fisheries and Food, Burnham-on-Crouch (England). Fisheries Lab.
R. A. A. Blackman, and K. W. Wilson.
Marine Pollution Bulletin, Vol 4, No 11, p 169-171, November 1973. 1 tab, 7 ref.

Descriptors: *Toxicity, *Waste disposal, *Marine fish, *Clams, *Shrimp, *Oysters, Bioassay, Water pollution effects, Industrial wastes, Mortality.
Identifiers: *Red mud, Scrobicularia plana, Cardium edule, Solea solea, Mytilus edulis, Crangon crangon, Agonus cataphractus, Germany, United Kingdom, North Sea, Bristol Channel.

Red mud, which is a waste product from the reduction of bauxite in the production of aluminum, has been disposed of in Bristol Channel by the UK with no apparent harmful effects. However, in considering the North Sea as a potential dump for red mud, Germany concluded that such disposal would be inadvisable because of detrimental effects on fauna. To determine whether the difference in results occurred from differences in chemical or physical characteristics of the red muds, bioassays were conducted with red muds from the UK and Germany. Red muds contain various quantities of Fe_2O_3, Al_2O_3, SiO_2, Na_2O, CaO, TiO_2, and ash. The experimental solutions were prepared from settled solids; the UK material had about 26 percent solids and the German 55 percent. The experiments were of two types: exposure to red mud settled on a substrate or red mud maintained in suspension. Scrobicularia plana, a deposit-feeding bivalve, Cardium edule, a suspension-feeding bivalve, and Solea solea, a bottom-living flatfish, were exposed to the deposits (5.0-50 mg/sq cm). Mytilus edulis, Crangon crangon (brown shrimp), and Agonus cataphractus (armed bullhead) were exposed to the suspension (up to 33 g/l). All organisms seemed to be unaffected by red mud except the armed bullhead. At 33 g/l, all bullheads died within 72 hr. No mortality occurred in 72 hr with 3.3 g/l red mud. On the evidence of the comparative studies it is concluded that the differences in origin and treatment of bauxite result in red muds of only slightly different toxicities. The physical and

chemical characteristics of the waste and its observed effects on plants and animals in the laboratory are important considerations, but they must be related to the hydrographic and biotic features of the proposed disposal site, to the quantities involved and to the method of disposal. PHILOMETRA NODULOSA IN WYOMING WHITE SUCKERS,
Wyoming Game and Fish Commission, Casper.
T. J. Clifford, and S. Facciani.
Prog Fish-Cult, Vol 34, No 4, p 235-236, 1972, Illus.
Identifiers: *Copepod, Philometra-nodulosa, *White suckers, *Wyoming(Ocean Lake), *Water temperature, *Nematodes.

A severe infection by the nematode P. nodulosa was observed in the fins of the white sucker population of Ocean Lake, Wyoming. Information on the infection rate, migration date, and midlake water temperature was collected. Water temperature appeared to be the principal factor governing migration of the female nematode from the fins of the fish. Only the female P. nodulosa is infective in the fins, 'cheek galleries,' and gular areas of fish and subsequently migrates from the fishes body to release larvae from its enlarged uterus. The larvae are ingested by copepods which are in turn ingested by fish where they become reinfective as adults.--Copyright 1973, Biological Abstracts, Inc.

Contract Report, April 1972. 373 p, 141 fig, 60 tab, 16 ref. Army Corps of Engineers Contract DACW 21-71-0020.

Descriptors: *Dredging, *Environmental effects, *Salt marshes, Wetlands, Spoil banks, Water pollution effects, Silting.

The environmental response to the deposition of dredged material on salt marshes was studied in diked and undiked confinements. Studies of water quality changes, studies of salt marsh sediment responses, and biological studies were directed toward identifying any changes in the biota in areas of dredging activities. In natural and relatively unpolluted areas, dredging has no significant effect on water quality where diked or undiked techniques are used. In polluted areas in marine environments, water quality impairment is caused by dredging activities. The time that the water with the dredge material is allowed to stay in the spoil area may greatly influence the quality of the effluent from the spoil area. The depth of spoil material deposited on the salt marshes will greatly affect the time of reequilibration of the salt marsh vegetation to its original configuration. No effects of dredging on the fishes and macroinvertebrate fauna within the 1971 dredged areas along the Intracoastal Waterway of Georgia could be defined. Seasonal patterns between experimental and control stations showed no deviations outside of apparent normal ones. In addition, samples obtained immediately prior to, during, and after dredging showed no patterns which could specifically be assigned to effects of dredging. (Knapp-USGS)

THE NONPARASITIC DISEASES. IMMISSION DAMAGE (GAS, SMOKE AND DUST DAMAGE). WASTE WATER DAMAGE INCLUDING DAMAGE CAUSED BY SOLID WASTES,.
Paul Parey: Berlin, West Germany. 1970. 227 p. Illus.
Identifiers: Books, Dust, Fluorides, Gas, *Immission damage, Lime, Metals, Nitrates, Nitrites, Nonparastic diseases, Smog, Smoke, Solid wastes, *Air pollution effects, *Water pollution effects, *Bibliographies.

Aspects of protection for a wide range of plants, especially cultivated plants, against immissions are discussed. Immissions include SO2, fluoride compounds, ammonia, H2S, nitrous gases, H2SO4, chromic acid, smog and peroxyacetyl nitrate, nitrite, lime, alkali, basalt, metal, arsenic and grain dusts, and ashes. The damage to the plants, their mode of effect, plant resistance and determination of these immissions in the atmosphere are discussed. The effect of waste water and solid wastes on plants and soil, the fertilizer value of some household and industrial wastewater and damage caused by alkali salts, trace elements, organic substances, detergents, radioisotopes, compost, sewage sludge, mineral oil products and solid industrial wastes are also discussed. An extensive bibliography is included at the end of each section.--Copyright 1973, Biological Abstracts, Inc.

BIONOMICS OF CYCLOPS STRENUUS ABYSSORM SARS (COPEPODA:CYCLOPOIDA),
Freshwater Biological Association, Ambleside (England).
W. J. P. Smyly.
Oecologia (Berl). Vol 11, No 2, p 163-186. 1973. Illus.
Identifiers: Biomass, *Bionomics, *Copepoda, Cyclopoida, Cyclops-Strenuus-Abyssorum, Dissolved oxygen, Fecundity, Lakes, Production, Sewage, Water pollution effects, *English Lake District.

The annual cycle of C. strenuus abyssorum in some lakes of the English Lake District is described. Esthwaite Water, Rydal Water and Grasmere, all enriched by sewage, and Buttermere, a relatively unproductive lake, were sampled most frequently. There is only 1 effective generation in the year in each of these lakes. Individuals hatch from eggs laid in the spring. In the deepest of the 4 lakes (Buttermere), these individuals reach the adult stage in early winter, pass the winter in the planktonic zone and start laying eggs early in the following year. In the other 3 lakes, most individuals of the spring generation reach the 5th copepodid stage by mid-summer and then spend the next 8 mo. in the profundal zone. They leave this zone in Feb. or March to return to the planktonic zone, become adult and start breeding. In July a few individuals may mature in the planktonic zone. A correlation between the time in mid-summer when stage V copepodids appear in the profundal zone of the 3 shallower lakes and amounts of dissolved O2 in this zone is shown. Although a correlation of this kind is plausible, presence of stage V copepodids in a deep, well oxygenated lake (Tirlmere) suggests that a casual connection of this kind is too simple an explanation. Rates of development of the different instars were experimentally at constant temperatures and used to estimate production. Production, biomass and fecundity were all higher in Esthwaite Water than in the other 3 lakes.--Copyright 1973, Biological Abstracts, Inc.

LOW PH LEVELS WIPE OUT SALMON AND TROUT POPULATIONS IN SOUTHERNMOST NORWAY,
K. W. Jensen, and E. Snekvik.
Ambio, Vol 1, No 6, p 223-225, 1972, Illus.
Identifiers: *Norway, Fish populations, *Salmon, *Trout, *Hydrogen ion concentration, Fish hatching, Fish mortality.

Low pH levels in rivers of southern Norway have resulted in the mortality of trout and salmon. Experiments show that the lower pH limits for normal hatching and fry development are pH 5.0-5.5 for salmon, 4.5-5.0 for sea trout and ca pH 4.5 for brown trout. An examination of the relation between pH values in the rivers and lakes in question and salmon and trout populations shows that these fish populations generally decrease in size as the pH level decreases.--Copyright 1973, Biological Abstracts, Inc.

PRELIMINARY LABORATORY TESTS FOR THE CONTROL OF ALGAE IN RICE FIELDS (IN ITALIAN),
Milan Univ. (Italy). Istituto di Patologia Vegetale.
M. Bisiach.

Riv Patol Veg, Vol 8, No 2, p 159-181, 1972, Illus, English summary.
Identifiers: *Algae control, *Algicides, Benzuride, Captafol, Chloroacetamido-3, Folpet, Hydrodictyon-reticulatum, Laboratory tests, *Naphtho quinone derivatives, Oedogonium, Potassium permanganate, *Rice fields, Spirogyra, Tests.

Benzuride, Captafol, HOE 2997, Folpet and KMnO4 at 0.5, 1, 2, 4 and 8 ppm were tested against Spirogyra sp., Oedogonium sp. and Hydrodictyon reticulatum. Rice seedlings are often killed by suffocation caused by algal scum. All the chemicals except Benzuride showed marked algicidal activity. HOE 2997 (2,dichloroacetamido-3,chloro,1,4naphthoquinone) has a complete algicidal activity at 1 ppm against Oedogonium sp. and H. reticulatum and at 2-4 ppm against Spirogyra. The naphthoquinone derivative was not phytotoxic for rice, and is recommended for the control of algae in rice fields.--Copyright 1973, Biological Abstracts, Inc.

DISTRIBUTION AND EPIZOOTIOLOGICAL IMPORTANCE OF DACTYLOGYRUS EXTENSUS (MONOGENOIDEA) IN SLOVAKIA (IN CZECH),
R. Zitnan.
Helminthologia (Bratisl). 11. p 141-146, 1970, English summary.
Identifiers: *Carp, *Czechoslovakia(Slovakia), *Dactylogyrus-extensus, Distribution, Epizootiological studies, *Monogenoidea.

Carps (1350) were examined in Slovakia (CSSR) in 54 localities of different water types during 1957-1969. D. extensus was found in all localities, its total distribution rate being 82.9% with a frequency rate of 1-246 specimens. The importance of D. extensus in early spring at a water temperature below 10C when young carp may be seriously endangered in hibernation ponds is indicated.--Copyright 1973, Biological Abstracts, Inc.

ON THE PROBLEM OF HOST SPECIFICITY, RESERVOIR PARASITISM AND SECONDARY INVASIONS OF CAMALLANUS LACUSTRIS (NEMATODA:CAMALLANIDAE), (IN CZECH),
Ceskoslovenska Akademie Ved, Prague. Parazitologicky Ustav.
F. Moravec.
Helminthologia (Bratisl). 10. p 107-114, 1969(1971), Illus.
Identifiers: Camallanidae, *Camallanus-lacustris, *Cyprinid, *Fish parasites, Host specificity, *Nematoda, *Perch, Reservoirs, *Salmonoid.

C. lacustris parasitizes mainly perch but can often be found in representatives of other families, e.g. Cyprinid and salmonoid fishes. Secondary invasions by adult parasitic worms from the original host to a new host fish are possible. The possibility of an atypical location of C. lacustris larvae in the host was investigated and no larvae were found in atypical locations.--Copyright 1973, Biological Abstracts, Inc.
W74-05359

COMPARATIVE STUDY OF THE EFFECT OF SOME ANION ACTIVE DETERGENTS ON THE REPRODUCTION OF LISTERIA MONOCYTOGENES AND OTHER BACTERIA,
J. Durst, J. Palicska, and A. Sawinsky.
Z Gesamte Hyg Grenzgeb, Vol 18, No 8, p 618-621, 1972, Illus.
Identifiers: Bacteria, *Bactericidal agents, *Detergents(Anion active), Escherichia-coli, *Listeria-monocytogenes, Pseudomonas-aeruginosa, Reproduction, Waste water.

The effects of Na dodecyl benzenesulfonate (DBS) and Na lauryl sulfate (LS) in concentrations up to 10000 microgram/ml on growth of L. monocytogenes, Pseudomonas aeruginosa and Escherichia coli cultures showed that at the doses used, both detergents had a bactericidal effect on L. monocytogenes. P. aeruginosa and E. coli were much less sensitive to the detergents. The intensity of the effect of the detergents was dependent on the substances in which they were dissolved; the bactericidal effect of DBS was higher in water and NaCl and the effect of LS was higher in meat broth boullion. Since only very high detergent concentrations have very high bactericidal effects in waste water, L. monocytogenes could occur in these waters. The occurrence of L. monocytogenes in surface waters is less probable, since lower detergent concentrations have a bactericidal effect.--Copyright 1973, Biological Abstracts, Inc.

5D. Waste Treatment Processes

REMOVAL OF HEAVY METALS FROM MINE DRAINAGE BY PRECIPITATION,
Denver Univ., Colo. Dept. of Chemical Engineering and Metallurgy.
L. W. Ross.
Copy Available from GPO Sup Doc as EP1.23:670/2-73-080, $1.00; microfiche from NTIS as PB-228 584 $1.45. Environmental Protection Agency Technology Series report EPA-670/2-73-080, September 1973. 64 p, 22 fig, 1 tab, 14 ref. EPA Project 14040 FZC.

Descriptors: *Mine drainage, Metals, Sulfides, *Neutralization, *Heavy metals, Chemical precipitation, *Waste water treatment, Colorado, Rocky mountain region, Computer programs, *Recycling, Costs, *Mine wastes.
Identifiers: San Juan Mountains, *Sulfide treatment, *Recovery(Mine wastes).

Heavy metals in mine drainage waters of the Rocky Mountains can be removed by a two-stage process consisting of (1) neutralization followed by (2) sulfide treatment. The first stage removes ferric and aluminum hydroxides, and the second (sulfide) stage precipitates the heavy metals that are most objectionable as pollutants, and that are of possible interest for economic recovery. The two-stage process has been demonstrated in the laboratory and in a field experiment. In the field, powdered lime was employed for neutralization, and barium sulfide was employed as sulfide source in a two-stage treatment tank. The ferric and aluminum hydroxides failed to settle when the slightest winds disturbed the surface of the settling pond, but the sulfides settled within a few feet downstream. The measured pH of treated streams has proven entirely satisfactory for control of chemical additions. A computer program based on published values of equilibrium constants and solubility-product constants is capable of adequate prediction of the required chemical quantities for treatment, and of the resulting metal concentrations in solution. The economics of chemical addition indicates that recovery of sulfides (CuS, ZnS) for sale to smelters can partially offset the cost of treatment, but never completely. (EPA)
W74-04851

DYNAMIC BEHAVIOR OF A COMPLETE-MIXING ACTIVATED SLUDGE SYSTEM,
Kansas State Univ., Manhattan. Dept. of Chemical Engineering.
G. C. Y. Chu, L. E. Erickson, and L. T. Fan.
Biotechnology and Bioengineering, Vol 15, p 1101-1121, November 1973. 13 fig, 2 tab, 23 ref.

Descriptors: *Activated sludge, *Biological treatment, *Waste water treatment, Flow rates, Chemical oxygen demand, *Aeration, Organic matter, Cultures, Gravimetric analysis, Recycling, *Sludge treatment.
Identifiers: Wasting rates, Continuous cultures, Adenosine triphosphate, Dry weight.

The dynamic behavior of a laboratory-scale activated sludge biological waste treatment process with recycle and wasting of sludge was investigated by subjecting the system to step changes in the influent waste concentration, the recycle flow rate, or the sludge wasting rate. The dynamic behavior of the system was examined by measuring adenosine triphosphate (ATP) in addition to dissolved chemical oxygen demand (COD) and cell dry weight in the aeration tank. Cell dry weight of the recycle flow and effluent COD were also measured. System performance changed appreciably when the system was subjected to step changes in the influent waste concentration, the recycle flow rate, or the sludge wasting rate. Generally, the responses to a step increase and a step decrease of the same input variable were not symmetrical, especially in the response of the ATP concentration. The ATP/MLSS ratio was found to depend on the food-to-organism ratio in the aeration tank. When this ratio was small, the ATP/MLSS was large. The time constant analysis showed that the dry weight time constants were directly related to the sludge mean residence time; as the sludge wasting rate increased, the value of the time constant decreased. The time constants of the dissolved COD variation in the aeration tank were much smaller than those of the sludge dynamics. The dissolved COD time constants were found to be closely related to the fluid mean residence time in the aeration tank. (Mortland-Battelle)

POPULATION CHANGES IN ENTERIC BACTERIA AND OTHER MICROORGANISMS DURING AEROBIC THERMOPHILIC WINDROW COMPOSTING,
Rutgers - The State Univ., New Brunswick, N.J. Dept. of Biochemistry and Microbiology.
J. Savage, T. Chase, Jr., and J. D. Macmillan.
Applied Microbiology, Vol 26, No 6, p 969-974, December 1973. 9 fig, 2 tab, 13 ref.

Descriptors: *Enteric bacteria, *Farm wastes, *Hogs, *Aerobic conditions, Waste treatment, Temperature, Hydrogen ion concentration, Oxidation-reduction potential, Environmental effects, Salmonella, Temperature, Sampling, Methodology, Decomposing organic matter.
Identifiers: Survival, *Composting(Windrow), Bacterial populations, *Thermophilic conditions, Fecal streptococci, Cellulolytic microorganisms, Fecal coliforms, Mesophilic microorganisms, Enterococci, Actinomycetes, Culture media, Selective media, Biochemical tests, Mesophilic bacteria, Mesophilic fungi.

Composting of wastes from swine feeding operations was studied. The effects of the frequency of turning the wastes and addition of straw to improve the physical structure was studied to determine the most effective technique to rapidly increase the temperature and, consequently, destroy coliforms and Salmonella. Four different treatments were studied; the results showed that, with addition of 5 percent (wt-wt) straw and mechanical turning of the compost 20 times per week, the temperature reached 60C within 3 days and enteric bacteria were destroyed within 14 days. The possibility of survival of pathogens at the cool surface

of a windrow operation, however, has not been disproven. The results indicate a marked decrease in coliforms, salmonellae, and enterococci during the thermophilic stage of composting. For maximal sanitary safety, the thermophilic stage of composting should be reached as soon as possible. A succession of microbial populations was observed during the composting process. The bacteria increased in number before the temperature of the windrows rose and then declined, whereas cellulolytic organisms and actinomycetes in general increased in the thermophilic stage. Presumably, the mesophilic bacteria rapidly attack the more readily available organic constituents, resulting in a temperature increase. The increased temperature favors the cellulolytic organisms, and the mesophilic bacteria largely disappear. The actinomycetes appeared in the final stage to such an extent that the surfaces of the compost piles were white or gray. These organisms are known to play a role in the humification of organic matter, which results in a stabilized product. (Holoman-Battelle)
W74-04908

SOIL AS A MEDIUM FOR THE RENOVATION OF ACID MINE DRAINAGE WATER,
Pennsylvania State Univ., University Park. Dept. of Agronomy.
E. J. Ciolkosz, L. T. Kardos, and W. F. Beers, Jr.
Available from the National Technical Information Service as PB-228 868, $10.25 in paper copy, $1.45 in microfiche. Pennsylvania State University Institute for Research on Land and Water Resources, Technical Completion Report, December 1973. 135 p, 24 fig, 30 tab, 38 ref, 1 append. OWRR A-027-PA(1). 14-31-0001-4038.

Descriptors: *Acid Mine Water, Percolation, Acidity, *Iron, *Conductivity, *Soil properties, Silt loam, Clay loam, Cation exchange, Water quality, Calcium carbonate, *Pennsylvania, *Hydrogen ion concentration, *Waste water treatment, Water pollution control.
Identifiers: Rayne silt loam, Guernsey silty clay loam, Soil pH, Renovation, Equilibration.

Equilibration of soil material from three horizons (Ap, B23 and Cl) at various ratios (1:1, 1:5 and 1:50) of soil to acid mine drainage water (AMW) indicated that maximum effect on pH, total acidity, conductivity, and iron content of the AMW occurred within five minutes and in the narrowest soil:AMW ratio. At 32 hours pH was increased from 3.1 to 6.6 with the Ap horizon material in the 1:1 ratio. The more acidic B23 and Cl horizons increased the pH one unit. Total acidity decreased 85%, 65% and 45% with the Ap, B23 and Cl materials, respectively. Conductivity decreased about 5 to 10%. Total iron content in the 1:1 system was decreased from 250-330 mg/l to a trace with all three soil materials. Percolation of AMW through reconstructed 40-inch soil profiles of Rayne silt loam and Guernsey silty clay loam at a loading rate of 5 inches at weekly intervals for 20 weeks increased pH of the AMW from 2.6-2.8 to 4.0 with the Rayne soil and to 8.0 with the calcareous Guernsey soil. Total acidity was decreased 75% with the Rayne soil while the Guernsey soil produced an alkaline column effluent. Iron was totally removed by both soils. Al was decreased 50% by the Rayne soil. The Guernsey soil totally removed Al, Zn, Cu, and Mn. Conductivity was decreased 16% by the Rayne and 11% by the Guernsey. Twenty-one soil samples (horizons) from seven Pennsylvania soils were equilibrated for 32 hours three times in succession in a 1:5 soil:AMW ratio. Multiple linear regression analysis was used to evaluate the effect of certain soil properties on the chemical quality of the equilibrated AMW. Most of the variation of pH, total acidity and iron was accounted for by cation exchange capacity and $CaCO_3$ equivalent.
W74-04981

ECOLOGY OF DAPHNIA IN STABILIZATION PONDS,
Texas State Dept. of Health, Austin. Div. of Wastewater Technology and Surveillance.
R. Dinges.
Report 1973. 41 fig, 14 tab, 69 ref, appendix.

Descriptors: *Waste water treatment, *Daphnia, *Oxydation lagoons, *Biological treatment, Texas, Photoperiodism, Life cycles, Ammonia, Toxicity, Sulfides, Hydrogen ion concentration, Depth, Marketing, Design, Water quality, Bibliographies, Effluents, Crustaceans, Water purification, Algae, Rotifers, Dissolved oxygen, Hatching, Predation, Pilot plants.
Identifiers: *Daphnia similis, Daphnia pulex, Moina, Lemna.

It was observed that the presence of Daphnia resulted in clarified wastewater stabilization pond effluent in a few (6%) Texas locations. This investigation focused on the suitable environmental conditions for Daphnia and Moina. The two Daphnia species, D. similis and D. pulex, were only present in extra deep ponds. The manner in which Daphnia serves to stabilize and clarify water could include digestion processes, by incorporation of organics into biomass, and some material is rendered inert by conversion into chitin, the material of which Daphnia shells are composed. A limited market for Daphnia exists, but would quickly be satisfied should mass culture in wastewater prove feasible and offers a real possibility of gaining significant financial returns from a wastewater resource. A pilot plant operation indicated that successful operation required provision of adequate mixing-aeration to supply the respiratory needs and associated organisms and to preclude evolution of soluble sulfides from benthic deposits and to control pH within a range of 7.0 - 7.5. Daphnia culture (which is described) may be feasible to further improve effluents from secondary wastewater treatment plants due to its feeding habits on algae and other suspended organic material. Its life cycle and a pertinent literature review are included. (Auen-Wisconsin)

AIR FLOTATION-BIOLOGICAL OXIDATION OF SYNTHETIC RUBBER AND LATEX WASTE-WATER,
Firestone Synthetic Rubber and Latex Co., Lake Charles, La.
A. H. King, J. Ogea, and J. W. Sutton.
Copy available from GPO Sup Doc as EP1.23:660/2-73-018; $1.60; microfiche from NTIS as PB-229 408 $1.45. Environmental Protection Agency, Technology Series Report, EPA-660/2-73-018, November 1973. 136 p, 21 fig, 20 tab, 14 ref. EPA Project 12110 GLP.

Descriptors: *Waste water treatment, Industrial wastes, Treatment facilities, *Synthetic rubber, *Louisiana, *Coagulation, Flocculation, *Flotation, *Biological treatment, Aerated lagoons, *Oxidation, Biochemical oxygen demand, Pilot plants, Construction costs, Operating costs, Design data.
Identifiers: Lake Charles(La).

The operation of a secondary waste-water treatment facility for treatment of the combined wastewater from Firestone's Lake Charles, Louisiana synthetic rubber manufacturing plant was studied for a period of nine months. The waste-water treatment facility was designed to treat an average daily flow of 3.4 mgd and a BOD load of approximately 2,000 lbs/day. The report describes the laboratory and pilot studies that were performed during the process development phase of the project and presents design data, operational data, and treatment cost data for the full scale facility. The effluent BOD concentration averaged 11.5 mg/l, with a suspended solids content of 29 mg/l. The BOD removal rate coefficient averaged .067 mg/l/day with an average BOD loading rate of .548 lbs BOD/day/lb MLSS. Capital costs including construction for the treatment facility were $1,472,528. Operational, maintenance, and depreciation costs were $.499/1,000 gals. of raw waste-water treated, excluding sludge disposal costs. (EPA)
W74-05105

INTERSTATE PLANNING FOR REGIONAL WATER SUPPLY AND POLLUTION CONTROL.
Weston (Roy F.), Inc., West Chester, Pa.
Copy available from GPO Sup Doc as EP1.16:16110FPP 11/71, $3.00; microfiche from NTIS as PB-229 573 $1.45. Water Pollution Control Research Series, Environmental Protection Agency, November 1971. 206 p. EPA Project 16110 FPP.

Descriptors: *Planning, *River Basin development, *Pollution abatement, Optimum development plans, *Regional analysis, *Interstate Commissions, *Water supply, Land use, *Alternative planning, Waste disposal, *Waste water treatment, Sewage treatment, Projections, Human population, Water demand.
Identifiers: Waste treatment regionalization, *Delaware River(Tock's Island region).

This report, prepared for Delaware River Basin Commission presents the results of a study of the problem of water supply and waste disposal in the three-State, six-county region in which the Tocks Island Reservoir and the Delaware Water Gap National Recreation Area are being developed. Peak summer populations are projected over a 50-year period and utilities systems alternatives which could accommodate such projected growth are presented. Water supplies in the region are seen as adequate to meet future demands, with heavy emphasis on development of groundwater resources. Five alternative sewerage plans, ranging in degree of regionalization from 116 local treatment systems to a single system for the entire region, are outlined including detailed cost estimates. Preservation of water quality in the region is a primary objective of the study. (EPA)
W74-05108

TREATMENT OF LAUNDROMAT WASTES,
Rensselaer Polytechnic Inst., Troy, N.Y.
D. B. Aulenbach, P. C. Town, and M. Chilson.
Copy available from GPO Sup Doc as EP1.23/2:73-108, $0.95; microfiche from NTIS as PB-227 369 $1.45. Environmental Protection Agency, Technology Series Report EPA-R2-73-108, February 1973. 65 p, 18 fig, 20 tab, 10 ref. EPA Project 12120 DOD.

Descriptors: *Waste water treatment, *Recycling, *Filtration, *Ion exchange, Chemical precipitation, Effluents, Industrial wastes, Detergents, *Biochemical oxygen demand, *Chemical oxygen demand, *Alkylbenzene sulfonates.
Identifiers: Alum treatment.

Laboratory and field studies were conducted to evaluate the laundromat waste treatment capabilities and the effluent recycling possibilities of two systems. The Winfair Water Reclamation System (WWRS) involves the addition of alum at a pH of 4, sand filtration, and passage through an ion exchange resin. The American Laundry Machinery Industries (ALMI) Diatomaceous Earth Filtration System employs chemical precipitation prior to filtration. The WWRS resulted in a 61% BOD reduction, 71% COD reduction, 94% ABS reduction, and a buildup of total solids in the effluent. The system produced an effluent suitable for discharge into many streams. For effluent recycling, a functioning demineralizer would be required. The ALMI System achieved a 70% BOD reduction, 84% COD reduction, 98% ABS reduction, 94% PO4 reduction, and complete coliform removal. The increase in effluent alkalinity and hardness render very questionable the suitability of effluent reuse without softening and pH adjustment. The introduction of the system into existent

aundromats would increase the cost of washes by about 10 cents. (EPA)
W74-05109

KRAFT PULPING EFFLUENT TREATMENT AND REUSE - STATE OF THE ART,
Saint Regis Paper Co., Pensacola, Fla. Research and Development Center.
W. G. Timpe, E. Lang, and R. L. Miller.
Copy available from GPO Sup Doc as EP1.23/2:73-164, $1.25; microfiche from NTIS as PB-227 344 $1.45. Environmental Protection Agency, Technology Series Report EPA-R2-73-164, February 1973. 95 p, 8 fig, 18 tab, 110 ref. EPA Project 12040EJU.

Descriptors: *Waste water treatment, Industrial wastes, *Pulp wastes, *Activated carbon, *Water reuse, *Reviews, Surveys, Recycling, Municipal water, Industrial water, Oxidation, *Tertiary treatment.
Identifiers: Collection systems, Solids removal, *Lime treatment.

A survey is presented of the literature and other sources on present practices and advanced methods of handling and treatment of pulp and paper mill effluents, with particular emphasis on the kraft process, and the use of activated carbon and lime treatment as advanced methods of treatment. The survey was made as a first step of a development program aimed at maximum water reuse in kraft pulp and paper mills based on effluent treatment using activated carbon. The results of the survey include information on activated carbon and its applications in treatment of pulp and paper mill effluents as well as in treatment of municipal water supplies and effluents. Information is presented on lime treatment of kraft mill effluent and on other advanced treatment methods. It also covers the subjects of in-plant water reuse, effluent collection systems, solids removal, and biological oxidation. (EPA)
W74-05110

COMBINED SEWER OVERFLOW FOR THE HUDSON RIVER CONFERENCE,
Interstate Sanitation Commission, New York.
A. I. Mytelka, L. P. Cagliostro, D. J. Deutsch, and C. A. Haupt.
Copy availabe from GPO Sup Doc as EP1.23/2:73-152, $2.85, microfiche from NTIS as PB-227 341, $1.45. Environmental Protection Agency, Technology Series Report EPA-R2-73-152, January 1973. 287 p, 60 fig, 20 tab, 28 ref. EPA Contract 68-01-0055.

Descriptors: *Combined sewers, *Urban runoff, *Hudson River, *Interstate commission, Storm drains, *Sewers, Outfall sewers, *Treatment facilities, *Waste water treatment.
Identifiers: Solids removal, B.O.D. removal, Regulators.

A detailed examination was conducted of ten (10) combined sewer overflow systems within the portion of the Hudson River Basin lying within the Interstate Sanitation District. The work included the identification and study of these combined sewer systems in order to determine their location, physical characteristics, and service areas. The procedure employed included the physical examination of each system's regulators to determine their location, type, dimensions, and condition. A study of available records was made to determine, where possible, trunk line flow, interceptor line design capacity, and characterization of the drainage area served by each regulator which included population and land use. Ten (10) summary tables and forty (40) regulator location figures are included. Dry weather and wet weather sampling was also conducted. By-pass loadings for several pollution parameters have been calculated during storm flow conditions based upon this sampling. Recommendations for minimizing combined sewer overflows are included. (EPA)

WATER-POLLUTION CONTROL IN THE PRIMARY NONFERROUS-METALS INDUSTRY -- VOLUME I. COPPER, ZINC, AND LEAD INDUSTRIES,
Battelle Columbus Labs., Ohio.
J. B. Hallowell, J. F. Shea, G. R. Smithson, Jr., A. B. Tripler, and B. W. Gonser.
Copy available from GPO Sup Doc as EP1.23/2:73-247a, $1.90; microfiche from NTIS as PB-229 466, $1.45. Environmental Protection Agency, Technology Series Report EPA-R2-73-247a, September 1973. 168 p, 29 fig, 39 tab, 23 ref. EPA Project 12010 FPK. Contract 14-12-870.

Descriptors: *Metals, Water pollution control, Mining, *Industrial wastes, *Waste water treatment, Costs, *Copper, *Zinc, *Lead, Byproducts.
Identifiers: Nonferrous metals industry, Smelting, Refining.

The purpose was to identify specific research needs in the area of water pollution in the primary nonferrous metals industries. This program consisted of a survey of literature and the acquisition of data from industrial operations. The contents of the final reports (2 volumes) include: the identification of process steps using water and/or generating wastewater, the amounts of water used for various purposes, recirculation rates, amounts of wastewaters, specific or characteristic substances in wastewaters, the prevalence of wastewater treatment practice, methods, and costs; current treatment problems, and plans for future practices of recirculation or wastewater treatment. The metals reported on included copper, lead, zinc, and associated byproducts (arsenic, cadmium, silver, gold, selenium, tellurium, sulfuric acid, salts and compounds), mercury, (primary) gold and silver, aluminum, molybdenum, and tungsten. The information includes detailed processing descriptions and flowsheets, tabulations of quantities of water intake, quantities used by category, recirculated water, discharge water quantities and analyses, water treatment costs. Representative water flowsheets are given. (See also W74-05117) (EPA)
W74-05116

WATER-POLLUTION CONTROL IN THE PRIMARY NONFERROUS-METALS INDUSTRY -- VOLUME II. ALUMINUM, MERCURY, GOLD, SILVER, MOLYBDENUM, AND TUNGSTEN,
Battelle Columbus Labs., Ohio.
J. B. Hallowell, J. F. Shea, G. R. Smithson, Jr., A. B. Tripler, and B. W. Gonser.
Copy available from GPO Sup Doc as EP1.23/2:73-247b, $1.45; microfiche from NTIS as PB-229 467, $1.45. Environmental Protection Agency, Technology Series Report, EPA-R2-73-247b, September 1973. 113 p, 16 fig, 30 tab, 31 ref. EPA Project 120/0 FPK. 14-12-870.

Descriptors: *Metals, *Industrial wastes, *Waste water treatment, *Aluminum, *Mercury, *Gold, *Molybdenum, Byproducts, Water pollution control, Mining.
Identifiers: Nonferrous metals, Industry, Smelting, Refining, *Silver, Tungsten.

The trend in the primary aluminum industry is toward reduced or zero discharge of waste water from both alumina refineries and aluminum smelters. The principal treatment needs of the aluminum industry relate to common types of industrial waste water such as cooling tower blow-down and neutralization products, and the specialized need to remove or recover fluoride ion components from fume scrubbers at smelters. The primary mercury industry, by virtue of a current air pollution control problems, may require increased measures of water pollution control associated with air emission control equipment or new processing methods. The primary molybdenum industry, consisting of a small number of operations other than those associated with the copper industry, has taken or is designing effective methods of water pollution control ranging from isolated water systems to changes in flotation reagent concentrations. Plants processing refractory metal concentrates to end products generally are associated with municipal water systems and show high materials recoveries with concurrent close control and careful segregation of waste water streams. Neutralization with filtration of acid wastes is a common practice of the plants surveyed. The small amount of information available for the primary gold and silver industries shows greatly differing practices, ranging from zero discharge in arid climates to problems with mercury and cyanide contents in waste waters. REUSE OF SOLID WASTE FROM WATER-SOFTENING PROCESSES,
IIT Research Inst., Chicago, Ill.
R. D. Nelson, and E. Vey.
Available from NTIS, Springfield, Va. 22151, PB-224 820, Price $4.25 printed copy; $1.45 microfiche. Environmental Protection Agency Office of Solid Waste Management Programs Publication SW-530-56d, 1973. 108 p, 25 fig, 16 tab, 25 ref, 1 append.

Descriptors: *Water softening, *Sludge disposal, *Calcium carbonate, *Illinois, *Water reuse, Filtration, Drying, *Water treatment, Waste disposal, Sands, Solid wastes, *Dewatering.
Identifiers: Water softening sludge, Sludge reuse.

Methods for dewatering a water softening sludge from the village of Park Forest, Illinois, were studied. Uses for the dewatered sludge or ways in which it can be disposed of were evaluated. The initial concentration of the sludge is between 3.6% and 3.9% solids by weight. The sludge solids contain about 84% calcium carbonate, 11% magnesium hydroxide, and 5% miscellaneous and have 90% of the particles in the 1.5 to 30 micron range. The sludge is suitable for use as a mineral filler in paints, floor coverings, caulking compounds, and bituminous products. It can be mixed with sands, clays, and organic soils to improve their workability and strength characteristics. It can also be used as an agricultural liming material to improve workability and fertility of soils. If required, it can be used as a filler in concrete without adversely affecting strength and shrinkage characteristics. The best method of dewatering the sludge is vacuum filtration after gravity thickening. This dewatering method will produce a filter cake of about 45% solids and an almost clear filtrate which can be returned to the plant. (Knapp-USGS)
W74-05127

REMOVAL OF NITROGEN FROM TILE DRAINAGE-A SUMMARY REPORT, BIO-ENGINEERING ASPECTS OF AGRICULTURAL DRAINAGE, SAN JOAQUIN VALLEY, CALIFORNIA.
California State Dept. of Water Resources, Fresno. San Joaquin District.
Copy available from GPO Sup Doc as EP1.16:13030 ELY5/71-6, $0.50; microfiche from NTIS as PB 215 417 $1.45. Water Pollution Control Research Series, May 1971. 30 p, 6 fig, 2 tab, 6 ref. EPA Project 13030 ELY5/71-6. Contract 14-06-200-3389A.

Descriptors: *Waste water treatment, Nitrogen, *Farm wastes, *Water Pollution Control, Biological treatment, Nitrates, Treatment facilities, *Tile drainage, Denitrification, Algae, Algal control, Bacteria, Filtration, Desalination.
Identifiers: *Algal growth, Algal harvesting, *Bacterial denitrification, *Nitrogen removal, Algal stripping.

Studies by an interagency group have shown that it is technically feasible to reduce 20 mg/l nitrate-nitrogen in agricultural tile drainage to 2-5 mg/l by either algae stripping or bacterial denitrification. Conditions necessary for maximum algal growth

included 8- to 12-inch pond depth, addition of small amounts of nutrients (CO2, Fe, and P), up to four hours of daily mixing and detention times of from 5 to 16 days, depending on the season. The algae were harvested by coagulation-sedimentation followed by vacuum filtration. Bacterial denitrification was tested in anaerobic deep ponds and filters using methanol as a carbon source. Required detention times were on the order of 8 to 50 days for covered ponds (uncovered ponds were not suitable) and 1 to 2 hours for filters. During long-term operation of the filters periodic flushing was required to remove accumulated bacterial biomass. Preliminary cost estimates were $90 and $135 per million gallons for bacterial denitrification (either pond or filter) and algae stripping respectively. Laboratory studies indicated that nitrogen removal effectively lowered the biostimulatory nature of the waste with respect to algal growth in potential receiving waters. Two desalination processes were also studied--electrodialysis and reverse osmosos. Both processes effectively reduced total dissolved solids but neither removed boron, or reduced nitrate to the desired level. (EPA)

SEWERAGE FEASIBILITY STUDY, BROOME COUNTY, NEW YORK, SUMMARY, CONCLUSIONS AND RECOMMENDATIONS.
Clinton Bogert Associates, Fort Lee, N.J.
Broome County Sewer Agency, Broome County, New York, June 1969. 17 p, 1 fig, 5 tab.

Descriptors: *Sewerage, *Long-term planning, *Sewage disposal, *Regional development, *Wastewater treatment, *New York, Capital costs, Planning.
Identifiers: *Broome County(New York), Service costs.

For many years Broome County has relied on its major streams, the Susquehanna and Chenango Rivers, for the disposal of untreated and partly treated sewage from its urban core. Suburban areas within the urban core and the Villages of Lisle, Whitney Point, Windsor and Deposit and the developing Harpursville area in Colesville have relied upon individual disposal systems consisting of septic tanks and tile drainage fields for this purpose. The discharge of partly treated sewage has resulted in the gross pollution of streams. As the areas served by septic tanks and tile drainage fields have become more densely developed, increasing numbers of failures have been observed resulting in the overflow of septic tank effluent to the ground surface or to small water courses. These conditions should no longer be tolerated. Estimates made for this report indicate the County population should grow from about 230,000 at present to about 410,000 in 2020. The necessary growth in industrial and commercial facilities requires the extension of sewers to the developing areas that are contiguous to the older population centers in the urban core. Sewer extensions within the next few years should provide service to areas in Chenango, Conklin, Dickinson, Fenton, Kirkwood, Union and Vestal. About 1990, sewer extensions should be required into the Town of Maine. In addition to the urban core, population densities in the Villages of Deposit, Lisle, Whitney Point and Windsor now justify the construction of communal sewers. The Harpursville area in the Town of Colesville should develop to the point where sewers should be justified about 1980. (Poertner)

REGIONAL WATER AND SEWER PLAN, THE MID-MISSOURI REGION.
Preston (D. R.), Holts Summit, Mo.
Mid-Missouri Regional Planning Commission, Jefferson City, Missouri, 1972. 269 p, 80 fig, 6 tab. FHA Grant.

Descriptors: *Planning, *Water supply, *Sewerage, *Regional development, Municipal water, Sewers, Sewage treatment, Water demand, Water resources development.

A plan was prepared to serve as a coordinated guide for the development of water and sewer service to citizens of the Mid-Missouri Region. It is primarily directed to the rural areas and those communities having a population of less than 5,500 persons. The plan provides information on existing water and sewer systems and recommendations for additional systems needed in future years. The plan covers many counties in mid-Missouri the land area of which is predominately rural. The largest urban communities included are Jefferson City, Columbia, Fulton, Mexico, Centralia, Fayette, Booneville, Glasgow, Tipton, California, and Vandalia. A four-step planning process was used in the development of sewer system plan recommendations. This involved inventory of systems, population forecasts, identifying deficiencies, and analysis of the foregoing. General recommendations in both map and text form are given for each community in the region. The water system plan is divided into two related sections. The first concerns public water supply districts while the second concerns municipal water supply systems. Planning the water systems involved making an inventory of existing systems, applying general standards against the existing systems and population projections, and analysis of the foregoing. There are thirty public water supply districts in the mid-Missouri Region. They vary in size and serve rural areas having from 70 customers to more than 1,000 users. The total population served in 1972 was about 26,000 persons. (Poertner)
W74-05238

AREA-WIDE WATER AND SEWERAGE SYSTEM PLAN AND CAPITAL IMPROVEMENT PROGRAM.
Harte (John G.) Associates, Inc., Atlanta, Ga.; and Harris (Frederic R.), Inc., Jacksonville, Fla.
Coastal Area Planning and Development Commission, Brunswick, Georgia, May 1973. 215 p, 100 fig, 8 tab. HUD grant CPA-GA-04-04-1002.

Descriptors: *Regional analysis, *Water supply, *Sewerage, *Long-term planning, *Capital costs, *Georgia, Regional development, Future planning, Water resources development, Municipal water, Sewers, Sewage treatment, Industrial wastes, Atlantic coastal plain, Water demand, Waste disposal wells.
Identifiers: *Capital improvement program.

A review and updating of water and sewer studies made previously by the Coastal Area Planning and Development Commission is presented. Included is a summary of improvements proposed in reports of engineering studies. Priorities, projected programs, cost estimates and financing recommendations are given for meeting water supply and sewage disposal needs through 1990. Population and economic trends for the region are discussed. These statistics indicate that in other than the major municipalities and their suburbs, growth will be slow. For this reason, programs in the rural areas are largely limited to solving existing public health problems related to improper individual water supply and sewage disposal facilities. The most severe problems facing the major municipalities in the study area are the deterioration of the quality of the water supply brought on by concentration of industrial wells in relatively small areas and the inadequacy of sewerage facilities. The population growth in unincorporated areas around the major municipalities has also resulted in an urgent need for public water and sewer service. (Poertner)

SAGINAW COUNTY WATER AND WASTEWATER UTILITY MASTER PLAN.
Williams (Clyde E.) and Associates, Inc., South Bend, Ind.
Saginaw County Metropolitan Planning Commission, Saginaw, Michigan, May 1971. 245 p, 26 fig, 4 tab, 4 appendices. HUD Mich. P-299 (G).

Descriptors: *Planning, *Water supply, *Sewerage, *Waste water disposal, *Michigan, Municipal water, Water demand, Water resources development, Long-term planning, Storm drains, Capital costs.
Identifiers: *Saginaw County(Michigan).

Guidelines were prepared in the form of an engineering-planning report for use in the formal adoption of the water and wastewater utilities element of the County Development Plan. The report investigates the present status of the County's existing water and wastewater utilities and proposes county-wide water and wastewater utility master plans to the year 1990. Summaries are presented for projects currently under construction and cost estimates of proposed improvements, required to implement the master plans during the short and long range planning periods, are included. Background information is given concerning the County's planning goals and policies, population history and projections, natural physical characteristics, water resources, conservation of the water resources, water and wastewater treatment and preliminary information on storm water drainage problems. (Poertner)

TREATMENT FOR CLARIFYING WHITE WATER COMING FROM A GROUNDWOOD PULP MILL (TRATAMIENTO PARA LA CLARIFICACION DE AGUA BLANCA PROCEDENTE DE LA FABRICACION DE PASTA DE MADERA),
F. Kohn Cornejo.
ATCP (Association Mexicana de Technicos de las Industrias de la Celulosa y del Papel), Vol 13, No 1, p 17-20, Jan/Feb 1973. 1 fig, 2 tab, 3 ref.

Descriptors: *Pulp wastes, *Mexico, *Flocculation, *Coagulation, *Waste water treatment, Operating costs, Cost-benefit ratio, *Water reuse, Recirculated water, Additives, Pulp and paper industry, Slime, Electrolytes, Aluminum, Silica, Industrial water.
Identifiers: *White water, Groundwood mills, Mechanical pulping, Clarifiers, Flocculants, Coagulants, Polyelectrolytes, Alum(Aluminum-potassium sulfate), Aluminum compounds, Activated silica, Chemical consumption.

White water from the grinder room of a groundwood (mechanical pulp) mill was purified in a clarifier basin with addition of flocculants, notably alum, activated silica, and polyelectrolyte. The treated water was found suitable for reuse as process water in a paper mill without requiring microbicidal or algaecidal additives for slime control. The treatment cost slightly over 20 cents per cu m of clarified water. (Speckhard-IPC)

WASTE WATER TREATMENT: USING PURE OXYGEN FOR SECONDARY TREATMENT,
Union Carbide Corp., Tonawanda, N.Y.
L. C. Matsch, and W. C. Dedeke.
Complete M/S (21 p) available from A.I.Ch.E. Publications Dept., New York, N.Y. 10017. Cost $5.00. Chemical Engineering Progress, Vol 69, No 8, p 75-76, Aug 1973.

Descriptors: *Waste water treatment, *Oxidation, *Oxygen, *Pulp wastes, *Aeration, Suspended solids, Sludge, Sedimentation, Settling velocity, Sedimentation rates, Pilot plants, *Virginia, Pulp and paper industry, Dewatering.

The 'Unox' oxygen treatment system of Union Carbide Corp. is said to offer several advantages over the use of air for effluent aeration treatments. Among them are the ability to operate at higher concentrations of mixed liquor suspended solids, faster sludge settling rates, more concentrated underflows, a lesser amount of excess solids generation, superior dewatering ability of the sludge, and better resistance to occasional process shocks. Results are given of pilot plant trials at the West Point, Virginia, pulp mill of Chesapeake Corp. of Virginia. (Hansen-IPC)

METHANOL DISTRIBUTION IN AN EVAPORATION PLANT,
Billeruds A.B., Saffle (Sweden).
H. G. I. Arne, and S. Bergkvist.
Svensk Papperstidning, Vol 76, No 10, p 380-382, June 17, 1973. 2 fig, 2 tab, 4 ref.

Descriptors: Water pollution sources, *Pulp wastes, *Alcohols, *Biochemical oxygen demand, Water reuse, *Waste water treatment, Industrial wastes, *Evaporators, *Condensation, Pulp and paper industry, Treatment facilities, Steam, Heat exchangers, Waste disposal.
Identifiers: Kraft pulp mills, Scandinavia, Condensates, Black liquors, Methanol(Or Methyl alcohol).

Condensates from the evaporators of modern kraft mills are usually collected into a single stream from which a portion is withdrawn for reuse in other mill departments while the remainder is sewered and contributes to the BOD load of the receiving stream, mainly due to methanol being present. The distribution of methanol in various streams of a Scandinavian evaporation plant was calculated, using general distillation rules, and the results were verified experimentally. They showed that, for the customary III-IV-V-I-II sequence of liquor feeds, the condensates from the first surface condenser and from effects II and III (including the liquor preheaters) contain only small amounts of methanol and can thus be sewered to make room for the reuse of effect IV and V condensates which contain the main portion of methanol. Because of their small volume and high methanol concentration, condensates from liquor preheater IV and from the second surface condenser can be treated by steam stripping, using the Uddeholm system. The accumulation of methanol to be expected from condensate reuse may be reduced by increasing the steam vent from effect V and by providing it with an extra heat exchanger. Overall results of calculations and experiments indicate that a considerable reduction of condensate-caused water pollution is feasible. (Brown-IPC)

EFFECTS OF WASTE WATER RECYCLE IN A PAPERBOARD MILL,
Green Bay Packaging, Inc., Wis.
D. C. Morris.
Journal Water Pollution Control Federation, Vol 45, No 9, p 1939-1945, Sept. 1973. 5 fig, 3 ref.

Descriptors: Recirculated water, *Reverse osmosis, *Recycling, *Waste water treatment, *Pulp wastes, *Water reuse, Water conservation, *Corrosion, Maintenance, Operation and maintenance, *Wisconsin, Pulp and paper industry, Sulfite liquors, Water vapor, Humidity, Water circulation.
Identifiers: Sulfite pulp mills, NSSC(Neutral sulfite semichemical) pulping, Spent sulfite liquors, Board mills, Paper machines, Exhaust hoods.

A reverse osmosis process was installed at the NSSC (neutral sulfite semichemical) pulp and paperboard mill of Green Bay Packaging Inc. at Green Bay, Wisconsin, to concentrate dilute waste waters so that they could be mixed with stronger wastes before final treatment. Because reverse osmosis is expensive, substantial in-house recycling was practiced to reduce the volume of dilute wastes to be treated. The recycling procedure caused higher mill temperatures and humidities and shortened the service life of equipment through corrosion by the greater concentration of chemicals dissolved in circulating vapors and liquids. A hood had to be installed over the paper machine to protect the hall's roof from condensation droplets. Equipment maintenance also increased accordingly. (Witt-IPC)

WATER AND WASTE WATER PROBLEMS IN MODERN TEXTILE FINISHING PLANTS (WASSER- UND ABWASSERPROBLEME IM MODERNEN TEXTILVEREDLUNGSBETRIEB),
A. Stiebert.
Melliand Textilberichte, Vol 54, No 8, p 864-870, Aug. 1973. 3 ref.

Descriptors: *Textiles, *Water pollution sources, *Industrial wastes, *Waste water treatment, Water conservation, *Recycling, Economic efficiency, *Water reuse, Water purification, Dyes, Dye concentrations, Education, Manpower, Training, Costs, Biological treatment, Disinfection, Water softening, Corrosion, Sludge disposal, Organic loading.
Identifiers: Textile finishing, Mercerization.

Ground waters (well waters) and surface waters for use in textile finishing operations may require various pretreatments for removal of hardness, algae, coliform bacteria, and corrosive components. Waste water problems of the textile finishing industry involve mainly dyes, fixatives, the recovery of mercerizing liquors, sludge disposal, and general economic decisions. Several practical solutions to these problems are discussed. Outside consultants are not the sole answer, since local conditions influence results. Education and training of factory workers are essential to the success of any treatment installation. Water conservation through recycling is gaining in importance. A comparison of costs for different water purification processes indicates that biological effluent treatments are both difficult and costly. It is proposed to treat effluents containing strong organic loadings separately and to pass them to a municipal installation for biological processing. (Brown-IPC)
W74-05255

EFFLUENT -- FIBRE RECOVERY -- WATER SAVINGS: A METHOD TO ANALYSE AND TACKLE THE PROBLEMS,
K. D. Blundell.
Paper (London), Vol 179, No 3, p 118, 120-122, Feb. 7, 1973. 1 fig.

Descriptors: *Waste water treatment, *Pollution abatement, Water conservation, *Pulp wastes, *Pulp and paper industry, *Treatment facilities, Equipment, Biochemical oxygen demand, Suspended solids, Color, Cooling, Thermal pollution, Sludge treatment, Sludge disposal, Dewatering, Effluents, Waste treatment, Water pollution treatment.
Identifiers: Paper mills, Board mills, Savealls, Fiber recovery, Concentrating(Dewatering).

A broad outline is given of a systematic approach to the solution of effluent disposal, fiber recovery, and water conservation problems in paper and paperboard mills. Types of available equipment are described for dealing with fluctuating effluent volumes, for reducing the BOD and solids content of effluents, cooling thermal discharges, removing color bodies, and for concentrating and disposing of sludges. Guidelines to the selection of the most suitable facilities for specific conditions are also given, along with a list of available fiber-recovery units or savealls. (Witt-IPC)
W74-05257

QUICK BROWN FOX DOESN'T TRIP OVER THILMANY'S EFFLUENT ANYMORE,
M. MacLeod.
Paper Trade Journal, Vol 157, No 20, p 36-40, May 14, 1973. 4 fig.

Descriptors: *Treatment facilities, *Pulp wastes, *Wisconsin, *Pulp and paper industry, *Water conservation, Economic impact, Water reuse, Effluents, Pollution abatement, *Waste water treatment, Industrial wastes, Costs, Capital costs.
Identifiers: Kraft mills.

Thilmany Pulp and Paper Co., a division of Hammermill Paper Co., operates an integrated kraft pulp and paper mill and converting plant at Kaukauna, Wisconsin, on the lower Fox River. An environmental improvement program costing ca. $2.4 million was successfully financed via a municipal revenue bond issue and was recently completed to supplement existing treatment facilities. The installation comprises both external and internal effluent treatment measures. Internal water conservation measures include an extended white water collection system, high-pressure machine cleaning showers, reuse of decontaminated evaporator condenser water, and fiber-recovery savealls. The external treatment of 23 million gal/day of waste water involves an 186-ft diameter clarifier basin designed to remove 75% of suspended solids and 50% of 5-day BOD, a centrifugal sludge dewatering system employing pressure filters, and two biological oxidation lagoons of 30 million gal capacity each. A flowchart of the entire system, including auxiliary equipment, is included. (Witt-IPC)

THE PURIFICATION OF RESIDUAL WASTE WATERS OF THE SULFITE PULP INDUSTRY (DIE REINIGUNG VON RESTABWAESSERN DER SULFITZELLSTOFF-INDUSTRIE),
Cellulose Attisholz A.G., Luterbach (Switzerland).
A. Scherler.
Das Papier, Vol 26, No 10A, p 637-642, Oct. 1972. 8 fig, 2 tab. English summary.

Descriptors: *Pulp wastes, *Waste water treatment, *Bleaching wastes, *Sulfite liquors, Pulp and paper industry, Biological treatment, Capital costs, Operating costs, Costs, Economic efficiency, Biochemical oxygen demand, Chemical oxygen demand, Europe, Waste treatment, Ef-

fluents, Water pollution sources, Eutrophication, Treatment facilities.
Identifiers: *Switzerland, Attisholz process, Bentonite process, Evaporation condensates, Bleach plants, Sulfite pulp mills, Spent sulfite liquors, Ammonium base sulfite process, Acid sulfite pulping.

With exception of ammonium-base spent sulfite liquor, which may contribute to water eutrophication, the effluents generated by various acid sulfite pulping processes do not differ sufficiently in water pollution loads to warrant switching from one to another for environmental protection only. The biological treatment of sulfite mill effluents, especially the problems posed by evaporator condensates and bleach plant waste waters, are discussed, with emphasis on the Attisholz process. Among nonbiological treatment processes, which are increasing in popularity, the Bentonite process used at a Swiss sulfite pulp mill is of special interest. Assuming that 97% of all effluents are subjected to combined mechanochemical plus biological treatment, one can expect a reduction in 5-day BOD to 9-10 kg per 100 kg of oven-dry pulp produced. The achievable degree of purification is somewhat less for softwood-derived than for hardwood-derived sulfite mill effluents. Typical COD and BOD balances are illustrated. A two-stage biological treatment plant designed for a hydraulic load of 2500 cu m/hr and a 5-day BOD loading of 18 t/day would require an investment of 12.6 million Swiss francs. Operating costs are estimated at 2.35 million francs. Together with interest charges of 1.2 million francs, the total cost for waste water purification runs to 0.158 francs/cu m. (Wise-IPC)
W74-05260

SURVEY OF RESIDUAL WASTE WATER TREATMENT (UEBERBLICK UEBER DIE BEHANDLUNG DER RESTABWAESSER),
Technische Universitaet, Darmstadt (West Germany). Wasser- und Abwasserforschungesstelle.
W. Brecht.
Das Papier, Vol 26, No 10A, p 625-628, Oct. 1972. English summary.

Descriptors: *Pulp wastes, *Waste water treatment, *Treatment facilities, Pulp and paper industry, *Biological treatment, Waste water(Pollution), Water pollution sources, Organic loading, Biochemical oxygen demand, Effluents, Industrial wastes, *Pollution abatement, Sludge disposal, Europe, Waste treatment, Regulation, Legislation, Governments.
Identifiers: Paper mills, Pulp mills, Sulfite pulp mills, White water, Germany, Switzerland.

Increasingly strict government regulations for water quality control in Germany will force pulp and paper mills to add secondary (biological or nonbiological) treatment facilities to their primary mechanical-chemical effluent purification installations, so as to remove organic pollutants in addition to suspended solids. The major effluent treatment methods available to the pulp and paper industry are listed, and disposal of the resulting sludge is also mentioned. Differences in the characteristics of paper vs. pulp mill wastes are pointed out, as they affect the selection of an adequate treatment sequence. Thus, residual paper mill white water contributes only about 6 kg of 5-day BOD per ton of paper to the pollution load, compared to 50 kg of oxygen per ton of sulfite pulp produced. The former load is equivalent to the sewage generated daily by 80 people, the latter equivalent to that produced by a population of 750. Several Swiss sulfite mills had to shut down for environmental protection reasons. (Wise-IPC)

BIOLOGICAL AND NONBIOLOGICAL PROCESSES FOR REMOVING DISSOLVED ORGANIC SUBSTANCES FROM RESIDUAL WASTE WATERS (BIOLOGISCHE UND NICHTBIOLOGISCHE VERFAHREN ZUR ENTFERNUNG GELOESTER ORGANISCHER SUBSTANZEN AUS RESTABWAESSERN),
Technische Universitaet, Darmstadt (West Germany). Wasser- und Abwasserforschungsstelle.
H-L. Dalpke.
Das Papier, Vol 26, No 10A, p 631-635 (discussion p 635-637), Oct. 1972. 2 fig.

Descriptors: *Pulp wastes, *Waste water treatment, *Organic wastes, Pulp and paper industry, *Aerated lagoons, *Activated sludge, *Biological treatment, Filtration, Filters, *Trickling filters, Biodegradation, Oxidation, Adsorption, Incineration, Electrolysis, Electrodialysis, Flotation, Catalysts, Reverse osmosis, Chemical precipitation, Radiation, Ion exchange, Evaporation, Freeze drying, Ion transport, Organic loading, Dissolved solids, Effluents.
Identifiers: Concentrating(Thickening), Wet combustion(Chemical oxidation), Electroflotation.

Three types of biological effluent treatment processes are distinguished: (1) Aerated stabilization ponds merely accelerate natural bio-oxidative degradation of pollutants. (2) Single- and multistage activated sludge processes can operate with surface aeration or pressure aeration. (3) Fixed biological substrates, such as trickling filters, have been used commercially, but generally less effectively than activated sludge methods, of which a great variety are possible. Among nonbiological processes outlined are (1) adsorption (on activated carbon, flyash, sludge-derived coke, or synthetic adsorbents); (2) catalytic oxidation; (3) wet combustion (at high or low pressure); (4) direct-current treatments (electroflotation, electrodialysis, and electrolysis); (5) chemical precipitation (with or without chemical recovery); (6) reverse osmosis; (7) ion-exchange; (8) gamma-irradiation; (9) thickening or concentrating (by evaporation or freeze drying). The relative merits of these (largely still experimental) nonbiological methods are pointed out, with special regard to their applicability in the pulp and paper industry. (Wise-IPC)

REMOVAL OF RESIDUAL WASTE WATER SLUDGES (BESEITIGUNG DER RESTABWASSERSCHLAEMME),
Muenchen-Dachauer Papierfabriken Heinrich Nicolaus G.m.b.H. (West Germany).
G. Strittmatter.
Das Papier, Vol 26, No 10A, p 649-654 (discussion p 654-657), Oct. 1972. 8 fig, 3 ref. English summary.

Descriptors: *Sludge treatment, Sludge disposal, *Waste water treatment, *Pulp wastes, *Dewatering, *Drying, *Byproducts, *Incineration, Fertilizers, Recycling, Solid wastes, Humus, Fibers(Plant), Fuels, Filters, Filtration, Centrifugation, Treatment facilities, Equipment, Sedimentation, Settling basins, Separation techniques, Industrial wastes.
Identifiers: Composting, Vacuum filters, Presses, Screw presses, Filter presses, Belt filters, Boards, Board mills, Insulation boards, Panel boards, Paperboards, Building boards, Fiberboards, White water.

All pulp and paper mill waste water treatments produce fibrous sludge, regardless of whether they use chemical, mechanical, biological, or combined processes. Since the dry solids content of sludges ranges from 1 to 8%, economical handling methods require thickening (concentrating), dewatering, and drying steps prior to disposal or reuse. Equipment and techniques available for these processing steps are reviewed and illustrated, notably decanters, skimmers, centrifuges of various kinds, hydrostatic and vacuum filters, and filter, belt, and screw presses. While the solids-liquid separation technology has made significant strides, problems of satisfactory sludge disposal still await adequate solutions. Among reported commercial possibilities of sludge reuse are composting (to humus), combustion (as fuel), and resale to mills making paperboards, panel boards, insulation boards, and flame-retardant building boards. (Wise-IPC)

PURIFICATION OF BLEACHED KRAFT MILL EFFLUENTS BY ACTIVATED SLUDGE TREATMENT (OCZYSZCZANIE METODA OSADU CZYNNEGO SCIEKOW Z PRODUKCJI MASY CELULOZOWEJ SIARCZANOWEJ BIELONEJ),
Z. Skwara, K. Lelonkiewicz, and C. Leszczynski.
Przeglad Papierniczy, Vol 29, No 5, p 178-183, May 1973. 2 tab, 2 fig, 23 ref. English summary.

Descriptors: *Activated sludge, *Biological treatment, *Pulp wastes, *Bleaching wastes, *Waste water treatment, *Aeration, Evaporation, Biochemical oxygen demand, Settling basins, Nutrients, Phosphates, Sulfates, Ammonium salts, Organic loading, Suspended solids, Europe, Pulp and paper industry, Laboratory tests.
Identifiers: Kraft mills, *Poland, Condensates, Evaporator condensates, Black liquors, White water.

Two kinds of effluents from the Kostrzyn kraft mill (Poland) were subjected to laboratory treatments with activated sludge to study the effects of aeration time, BOD loading, and proportion of evaporator condensates. Both effluents contained ca. 100 mg oxygen per liter. One stream came from the digester room, pulp washing and screening, bleaching, and the pulp-drying machine ('wet machine'). It was mixed in 4:1 and 2:1 ratios with the other stream coming from the soda recovery boiler, black liquor evaporator, causticizer, and sulfate soap acidulation plant. After 1-hr sedimentation of suspended solids, both mixtures were aerated in 4 different tanks with addition of ammonium sulfate and potassium dihydrogen phosphate in the nitrogen to phosphorus ratio 2.5:0.5 per 100 parts of 5-day BOD, and with pH adjusted to 7.5. Activated sludge from secondary settling tanks was recycled to the continuously fed aeration tanks (8 liter capacity each). The BOD load was kept at 0.1 or 0.13-0.15 g per g of sludge per day. BOD reductions observed were 77% after 4 days and 90% after 7 days, using relatively low sludge concentrations (1-2 kg/cu m). Increasing the proportion of evaporator condensates in the effluent reduced the BOD removal to 87.3%. (Stapinski-IPC)

HOW MUCH WILL CLEANUP COST,
F. G. Hurtubise, D. Jones, and H. D. Paavila.
Pulp and Paper Magazine of Canada, Vol 74, No 9, p 48, 50, Sept. 1973.

Descriptors: *Economic impact, *Treatment facilities, *Pulp and paper industry, *Canada, *Pollution abatement, *Costs, Capital costs, Operating costs, Water reuse, Water consumption(Excluding consumptive use), Legislation, Regulation, Water quality standards, Water quality control, Waste water treatment.

Under regional antipollution regulations, the Canadian pulp and paper industry spent $195 million in 1960-1971 on water pollution abatement, viz., $130 million for in-plant improvements and $65 million on external treatment facilities. These measures reduced effluent BOD by 33%, water use by 19%, and suspended solids by 72% per ton of product. The 1971 federal water quality standards will require additional investments of $9,700 capital plus $3.91 operating cost per daily ton produced. Meeting the program's goal will cost the Canadian industry over $500 million. Data from a survey of various mills are included to support these estimates. (Brown-IPC)

COMBINED MILL EFFLUENT GOES TO AERATION POND IN PE (POLYETHYLENE) PIPELINE.
Pulp and Paper, Vol 47, No 4, p 112-113, April 1973. 2 illus.

Descriptors: Treatment facilities, *Pulp wastes, *Pipelines, *Plastics, *Bleaching wastes, *Waste water treatment, Industrial wastes, *Construction materials, Steel, *Oregon, Pulp and paper industry, Aerated lagoons, Corrosion.
Identifiers: Polyethylene, Willamette River(Oregon), Materials handling.

At the pulp and paper mill of Boise Cascade Corp. at Salem, Oregon, a high-density polyethylene pipeline was installed to convey effluents to an aeration pond for secondary treatment prior to discharge into the Willamette River. The pipeline carries a mixture of spent sulfite cooking liquor, bleach plant effluent, evaporator condensate, and paper mill white water. Resistance to corrosive liquids and ease of installation on land and under water are the major advantages of polyethylene over conventional wrapped or coated steel pipe. (Witt-IPC)
W74-05269

POLLUTION -- YESTERDAY, TODAY, AND TOMORROW,
T. W. Beak.
Pulp and Paper Magazine of Canada, Vol 74, No 11, p 25-26, 28-29, Nov 1973. 1 illus.

Descriptors: *Pollution abatement, *Pulp and paper industry, *United States, *Canada, Attitudes, Psychological aspects, *Social aspects, *Environmental control, Regulation, Legislation, Water quality standards, Governments.
Identifiers: Public relations, Cooperation.

Changes in water pollution by the Canadian pulp and paper industry and in abatement technology, economics, and attitudes from the 1950's to the present are discussed. Lessons to be learned from past over- and underreactions to environmental problems in North America are emphasized. The importance of good clean housekeeping practices is illustrated, along with the need to look beyond in-plant control measures. The paper industry must regain public confidence that it can and does operate without disrupting the environment. Cooperation with the proper authorities should convince the latter that their insistence on nationwide uniform effluent standards is not the answer to local situations. The vital function of professional consultants and service industries in fostering sound, objective attitudes is keynoted. (Brown-IPC)

RECYCLING WATER -- A SIMPLE SOLUTION,
Masonite Corp., Laurel, Miss.
J. E. Leker, and W. C. Parsons.
Southern Pulp and Paper Manufacturer, Vol 36, No 1, p 32-34, Jan 10, 1973. 4 fig, 10 ref.

Descriptors: *Waste water treatment, *Pulp wastes, *Recycling, *Water quality control, *Recirculated water, *Mississippi, Pulp and paper industry, Effluents, Water reuse, Reclaimed water, Evaporation, Evaporators, Suspended solids, Byproducts, Biological treatment, Aerated lagoons, Sludge treatment, Incineration, Sludge disposal, Discharge(Water), Sedimentation, Settling basins.

Difficulties of finding simple solutions to meeting antipollution water quality standards are discussed in the context of waste water treatment measures taken at Masonite Corp.'s pulp and board mill in Laurel, Mississippi, where a facility was designed for treating 7 million gal of effluent per day according to standards existing in 1970. An initial survey showed that the mill produced daily 257,000 lb of BOD and 40,000 lb of suspended solids. About 90% of the BOD was contained in the wash water from steam-processed pulp which amounted to less than 15% of the total waste water flow. This stream of wash water is concentrated in a quintuple-effect evaporator. Residual solids are converted into a marketable product. Two other effluent streams (process water plus cooling, sealing, and housekeeping waters) are handled separately in primary clarifiers from which 90% of treated water is recycled to the mill, the remainder being diluted with the second stream and treated in a biological contact-stabilization system. Overflows pass to a 10-acre aerated lagoon for polishing before reuse or discharge. Sedimented solids from the primary treatment are burned, disposed of as landfill, or utilized in other industries. An unsolved problem is the disposal of 20 t/day of excess biological sludge which is difficult to dewater. (Hansen-IPC)

EFFLUENT-FREE BLEACHED KRAFT PULP MILL: PRESENT STATE OF DEVELOPMENT,
Toronto Univ. (Ontario). Dept. of Chemical Engineering.
H. W. Rapson, and D. W. Reeve.
Tappi, Vol 56, No 9, p 112-115, Sept. 1973. 2 fig, 25 ref.

Descriptors: Water conservation, *Water reuse, *Pulp and paper industry, *Bleaching wastes, *Pulp wastes, Effluents, *Waste water treatment, Chlorine, Equipment, Sodium sulfate, Evaporation, Sodium chloride, Waste water(Pollution), Water circulation, Reclaimed water, Recirculated water.
Identifiers: Wash water, Evaporator condensates, Bleach plants, Kraft mills, Chlorine dioxide, Spent liquors, R-3 chlorine dioxide bleaching process, Pulp washing, Countercurrent processes, White liquors, Chemical recovery.

All aqueous effluents from bleached kraft pulp mills can be eliminated by recoverying and reusing all the water and chemicals required for bleaching. None of the process changes that would be involved are radical departures from existing technology, and none of the equipment needs are novel. Pulp can be washed completely countercurrently, from the last washer in the bleach plant to the first brown stock washer. A substantial portion of chlorine in the chlorination stage can be substituted by chlorine dioxide. Evaporator condensates can be steam- and air-stripped and reused to wash the bleached pulp. Salt (NaCl) is recoverable from the spent bleach liquor by evaporation of the white liquor and may be used to regenerate bleaching chemicals. All the chlorine and chlorine dioxide needed for bleaching, as well as the sodium sulfate used as cooking liquor makeup, are presently producible in the so-called 'R-3' process by the chlorine dioxide generator-evaporator-crystallizer. The design and development status of effluent-free kraft mills is discussed in the light of these possibilities. (Brown-IPC)

A MATHEMATICAL MODEL FOR OPTIMIZING THE DESIGN OF REVERSE OSMOSIS SYSTEMS,
Institute of Paper Chemistry, Appleton, Wis.
I. K. Bansal, and A. J. Wiley.
Tappi, Vol 56, No 10, p 112-115, Oct 1973. 3 fig, 9 ref, 4 tab.

Descriptors: *Reverse osmosis, *Waste water treatment, *Pulp wastes, *Optimization, *Mathematical models, *Simulation analysis, *Cost analysis, Cost-benefit analysis, Operating costs, Capital costs, Effluents, Maintenance, Osmotic pressure, Flow, Depreciation, Design data, Water pollution treatment, Reclaimed water, Pulp and paper industry, Sodium chloride, Pipelines.
Identifiers: Concentrating(Dewatering), Flux rate, Salt rejection.

A computerized mathematical model was developed for the optimal design of large-scale reverse osmosis (R.O.) systems to be used for concentrating dilute effluents of the pulp and paper industry. The model calculates the number of modules needed and their best configuration by optimizing the capital and operating costs of a large multistage concentrating system. This model was found to be sensitive to the reference NaCl flux rate, the osmotic pressure of liquors being processed, module depreciation, module cost per square foot of membrane, and module maintenance cost. Agreement between experimental data and results obtained with the mathematical model was within 10%. For the design of a manifolding and piping system of R.O. units, the number of modules operated in series seemed to be more important than the number of stages and the recovery ratios of water in each stage. Probably, the equivalent of two 18-tube modules in series (250-300 total linear feet) is optimum for 1/2-inch inside-diameter tubular modules, based on present capital and operating costs of an R.O. concentrating system. (Brown-IPC)
W74-05276

ECONOMIC IMPACT OF POLLUTION ABATEMENT ON THE SULFITE SEGMENT OF THE U.S. PULP AND PAPER INDUSTRY,
Little (Arthur D.), Inc., Cambridge, Mass.
C. Canty, F. G. Perry, Jr., and L. R. Woodland.
Tappi, Vol 56, No 9, p 52-55, Sept. 1973. 1 fig, 2 ref, 2 tab.

Descriptors: Cost-benefit ratio, Sulfite liquors, Pulp wastes, *Economic impact, *Pulp and paper industry, *Pollution abatement, *Regulation, *Treatment facilities, *Waste water treatment, Bleaching wastes, Water quality standards, Water quality control, Effluents, Capital costs, Operating costs, Legislation, Industrial wastes, Discharge(Water), Water pollution sources, Profit, Unemployment, Incineration, Byproducts, Biological treatment, United States.
Identifiers: Sulfite pulp mills, Spent sulfite liquor, Spent pulping liquors, Chemical recovery.

The probable impact of antipollution legislation on the economies of U.S. sulfite pulp and paper mills is discussed. The most serious effluent problem is caused by spent sulfite pulping liquors. Three treatment methods are compared with regard to efficiency and costs, viz., biological process, by-product recovery, and incineration. Capital investments and operating costs for treatment of spent bleach plant liquors, for removal of suspended solids, and for air pollution control are also presented. Seven U.S. sulfite mills having a total production capacity of 400,000 tons/year may not be able to cope with regulatory water quality demands, and may close down by 1976. Four additional mills with 470,000 t/yr combined capacities are operating with marginal profitability. Although shutdowns may cause regional temporary unemployment, salutary effects should include improved product supply-demand balance and better water utilization with increased recovery of fibers, chemicals, and heat to help reduce the pollution abatement costs. Most mills will incur comparable expenses to meet water quality standards and should be able to remain competitive. (Brown-IPC)
W74-05277

CHARACTERIZATION OF SULFITE PULPING EFFLUENTS AND AVAILABLE ALTERNATIVE TREATMENT METHODS,
National Council of the Paper Industry for Air and Stream Improvement, Inc., New York.
R. O. Blosser, and I. Gellman.
Tappi, Vol 56, No 9, p 46-50, Sept. 1973. 3 tab, 7 ref.

Descriptors: *Pulp wastes, *Sulfite liquors, *Pollution abatement, *Waste water treatment, *Water pollution sources, Regulation, Pulp and paper industry, United States, Management, Decision making, Treatment facilities, Industrial wastes, Pennsylvania, Washington, Florida, Effluents, Waste water(Pollution).
Identifiers: Chemical recovery, Pulp mills, Sulfite pulp mills.

The sources, volumes, compositions, and other characteristics of effluents from sulfite pulp mills using Ca-, Mg-, Na-, or ammonia-base cooking liquors are reviewed. Trends in the adoption of various chemical recovery systems, installation of accompanying external effluent treatment facilities, and decisions on expansion vs. termination of sulfite mills in response to pollution control regulations are described. Case histories are presented to document the viability of various management decisions, notably the measures adopted at Charmin Paper Products Co. (Mehoopany, Pa.), Crown-Zellerbach Corp. (Camas, Wash.), ITT Rayonier Inc. (Fernandina Beach, Fla.), and Weyerhaeuser Co. (Cosmopolis, Wash.). (Brown-IPC)

HOT PROBLEM SOLVED BY AERATED LAGOON,
Associated Water and Air Resources Engineers, Inc., Nashville, Tenn.
C. E. Adams.
Water and Wastes Engineering, Vol 9, p E8-E11, Sept. 1972. 5 tab, 1 diag.

Descriptors: Cooling, *Cooling towers, *Aerated lagoons, *Waste water treatment, *Pulp wastes, Cost-benefit ratio, *Economic efficiency, Operating cost, Capital cost, *Thermal pollution, Effluents, Pulp and paper industry, Temperature, Lagoons, Biological treatment, Industrial wastes.

A computer program was developed for comparing the merits of an aerated lagoon with those of a cooling tower for the purpose of reducing the temperature of paper mill effluents to a level suitable for biological treatment. For the particular case studied, aeration proved to be more economical than a cooling tower. Aeration required more land, but this was offset by the initial cost of the tower. The deciding factor was the high operating cost for pumping the wastes to the tower. In regions where land is more expensive, cooling towers could be the more economical way of preventing thermal pollution. (Buchanan-IPC)
W74-05280

CLOSED WATER CIRCULATION SYSTEM IN A PAPER AND PAPERBOARD MILL (GESCHLOSSENER WASSERKREISLAUF IN EINER PAPIER-UND KARTONFABRIK),
Papier- und Kartonfabrik Ofteringen (West Germany).
H. Widmer, and O. Widmer.
Wochenblatt fuer Papierfabrikation, Vol 100, No 23/24, p 930-932, Dec 15, 1972. 2 fig.

Descriptors: *Pulp and paper industry, Water conservation, *Recirculated water, *Water reuse, *Industrial water, *Waste water treatment, *Flotation, Discharge(Water), Effluents, Equipment, Treatment facilities, Pesticides, Additives, Slime, Microorganisms, Reclaimed water, Recycling.
Identifiers: *White water, Savealls, Paper machines, Board machines, Fourdrinier machines, Cylinder (Board) machines.

A completely closed water circulation system for paper and board machines is described, based on treatment of white water in flotation savealls with addition of a nontoxic slime-control additive. Experience with this system in two fourdrinier and two combined fourdrinier/cylinder machines for production of corrugating media, coated and uncoated paperboards, and packaging papers showed it to permit machine operation with a minimum of fresh water intake and practically no effluent discharge, without any adverse effects on product quality and production rate. (Speckhard-IPC)

FUNDAMENTAL VIEW OF THE CLOSED WATER CIRCUIT (DER GESCHLOSSENE WASSERKREISLAUF IN GRUNDSAETZLICHER BETRACHTUNG),
Technische Universitaet, Darmstadt (West Germany). Wasser- und Abwasserforschungsstelle.
W. Brecht, and H-L. Dalpke.
Wochenblatt fuer Papierfabrikation, Vol 101, No 8, p 235-241, April 30, 1973. 1 fig, 32 ref.

Descriptors: *Water reuse, *Pulp and paper industry, Water circulation, *Water conservation, Waste water(Pollution), Water pollution sources, Pollution abatement, Discharge(Water), *Economic feasibility, *Reviews, *Recycling.
Identifiers: White water, Paper machines.

A critical review of literature reporting experience with the closing or partial closing of process water circulation systems in paper mills discusses the planning and engineering stages involved in circuit closure, its advantages for pollution abatement, and its disadvantages or problems. The applicability of this technique is presently still limited, but holds promise of minimizing the discharge of aqueous effluents. Total effluent elimination, e.g., by the development of 'dry' (pneumatic) and synthetic paper manufacturing processes, will not be able to fill the increasing demand for paper. (Speckhard-IPC)
W74-05282

EXPERIENCES WITH CHEMICAL PRE-PURIFICATION OF KRAFT MILL WASTE WATER WITH MAGNESIUM CHLORIDE BRINE (POTASSIUM EXTRACTION LIQUOR) (ERFAHRUNGEN BEI DER CHEMISCHEN VORREINIGUNG VON SULFATZELLSTOFFABWASSER MIT MAGNESIUMCHLORID-SOLE (KALIENDLAUGE),
VEB Zellstoff- und Papierkombinat Trebsen (East Germany).
K. Schmidt, and D. Schladebach.
Zellstoff und Papier, Vol 22, No 2, p 45-49, Feb. 1973. 9 fig, 4 ref.

Descriptors: *Waste water treatment, *Pulp wastes, *Coagulation, *Chemical precipitation *Colloids, *Dissolved solids, Magnesium compounds, Chlorides, Lime, Sedimentation rates Sludge, Chemical oxygen demand, Pulp and paper industry, Byproducts.
Identifiers: Magnesium chloride, Wash waters.

Magnesium chloride, which is available in large amounts as a by-product of the potassium industry, can be used to precipitate colloids and dissolved solids from pulp wash waters. Sedimentation can be improved by additions of quick lime or caustic sludge. Treatment of pulp waste waters with 1.4 g of magnesium chloride per liter of effluent was found to reduce the COD by ca. 30%. (Ward-IPC)

WOOD WASTE REUSE IN CONTROLLED RELEASE PESTICIDES,
Washington Univ., Seattle. Inst. of Forest Products.
G. G. Allan, C. S. Chopra, R. I. Gara, A. N. Neogi, and R. M. Wilkins.
Available from the National Technical Information Service as PB-222 051, $4.85 in paper copy $1.45 in microfiche. Environmental Protection Agency report EPA 670/2-73-034, July, 1973. 86 p 16 tab, 14 fig, 124 ref. EPA grant EP 00319/Program Element No 1D2311.

Descriptors: *Pesticides, *Herbicides, *Wood wastes, *Lignins, *Cellulose, *Pulp wastes *Forest management, Trees, Coniferous trees Theoretical studies, Economic feasibility, Sawdust, Agricultural chemicals, Chemicals, Solid wastes, Toxicity, Safety.
Identifiers: Lignocellulose, Agricultural wastes, 2 4-D (2-4-dihydroxyphenoxybutyric acid), Controlled release pesticides, Corn cobs, Bagasse, Oat hulls.

The potential utilization of large volumes of agricultural residues, lignins, and wood wastes such as bark, sawdust, corncobs, oat hulls, and sugarcane bagasse, by chemical combination with pesticides was investigated. The preparation of pesticides with prolonged effectiveness and controlled-release characteristics from lignocellulosic wastes is described, and their economics are discussed. Theories permitting the effective period of such compounds to be predicted were developed and validated. Combinations of such wastes with 2,4-D (2,4-dichlorophenoxybutyric acid) were found to yield safely applicable herbicides effective in suppressing weeds and brush in the presence of conifers and in thereby substantially accelerating the growth of trees. (Brown IPC)

INVENTORY OF SPRAY IRRIGATION SYSTEMS IN THE GREAT LAKES BASIN OF CANADA.
Environment Canada, Water Pollution Control Directorate, Economic and Technical Review Report EPS 3-WP-73-5, Oct. 1973. 15 p. 2 tab, 1 map.

Descriptors: *Irrigated land, *Soil disposal fields, *Waste water disposal, *Industrial wastes, *Canada, *Great Lakes Region, Sprinkler irrigation, Seasonal, Winter, Irrigation, Irrigation practices, Irrigation ditches, Pulp wastes, Economic efficiency, Food processing industry, Farm management, Farm wastes, Waste disposal, Surveys.
Identifiers: Ridge and furrow disposal, Underdraining.

This government-authorized survey of industrial and sanitary effluent treatment systems using spray irrigation as partial or total disposal method included 60 industrial plant operations in Ontario, mostly farms and food processors, but also one paper mill (Strathcona Paper Co. Ltd.). The general usefulness of spray irrigation as a relatively cheap waste disposal method is emphasized. In spite of the small land area involved (ca. 2600 acres), nearly 1 billion gal of high-strength wastes are treated thus annually without major problems, such as shock loading. Sprayfield disposal is attractive to small enterprises with low capital, such as dairy and hog farms. Urban expansion and Canadian winters are the two major factors limiting more widespread use of this method. In some instances, ridge-and-furrow disposal is practiced in winter. Underdraining as a supplement to either ridge-and-furrow or spray disposal also deserves investigation, especially for industrial planning where extension of sewage facilities would cause ill-timed expenditures. Land used for irrigation is still available for later building purposes. (Brown-IPC)
W74-05288

A PULP AND PAPER MILL WITH FULLY CLOSED RECIRCULATION SYSTEM -- UTOPIA OR REALISTIC POSSIBILITY. (EINE ZELLSTOFF-UND PAPIERFABRIK MIT VOLLSTAENDIG GESCHLOSSENEM KREISLAUF -- EINE UTOPIE ODER EINE REALISTISCHE MOEGLICHKEIT),
Karlstads Mekaniska Werkstad A.B. (Sweden).
G. Ranhagen.
Zellstoff und Papier, Vol 22, No 6, p 172-179, June 1973. 2 tab, 17 fig.

Descriptors: *Pulp wastes, Pulp and paper industry, *Industrial water, *Waste water treatment, *Pollution abatement, *Recirculated water, Air pollution, Water circulation, Mathematical models, Effluents, *Recycling.
Identifiers: Kraft mills.

Models are presented for various closed water systems with little or no effluent, as well as for pollution-free air systems, in an integrated kraft pulp and paper mill. It is concluded that certain combinations could make the closed system a reality for the kraft industry, not just wishful thinking. (Ward-IPC)

APPLICATION OF MULTIGOAL WATER QUALITY PLANNING MODEL,
Krannert Graduate School of Industrial Administration Administration, Lafayette, Ind.
D. E. Pingry, and A. B. Whinston.
Journal of the Environmental Engineering Division, American Society of Civil Engineers, Vol 100, No EE1, Proceedings paper No 10322, p 61-75, February 1974. 1 fig, 9 tab, 7 equ, 8 ref.

Descriptors: Environmental engineering, *Indiana, *Water pollution control, *Alternative planning, River basins, Economics, *Comprehensive planning, Temperature, Dissolved oxygen, Cost-benefit analysis, Optimization, Simulation analysis, Treatment facilities, Regional analysis, Methodology, Mathematical models, Systems analysis.
Identifiers: *Nonlinear programming, Multiobjective planning, *Cost minimization, Streeter-Phelps models, *West Fork White River(Ind.).

A methodology which takes advantage of variances in stream assimilative capacity and treats water pollution as a regional, basin-wide problem is applied to the West Fork White River in Indiana. A simulation model of river basin water quality serves as the constraint set for an optimization model that searches for the minimum cost solutions given the quality goals. Specifically, the traditional Streeter-Phelps dissolved oxygen model is integrated with a heat decay model. The resulting quality model is incorporated into a nonlinear programming river basin model which is used to calculate least-cost water treatment systems for the West Fork White River, given several alternative water quality goals. The effect of the different goals on the annual total cost of the system is examined. Special attention is focused on the possibility of relaxing the quality goals downstream from major effluent sources in exchange for increased quality upstream from these sources. The role of the planning model as an information source for decision making is examined. An appendix includes a summary of the nonlinear algorithm used and, in particular, the methods used to handle large-scale problems. (Bell-Cornell)

MODELING OF WASTEWATER DISPOSAL SYSTEMS,
Norsk Institutt for Vannforskning, Blindern.
O. G. Lindholm.
In: Models for Environmental Pollution Control, (Ed. by R. A. Deininger), Ann Arbor Science Publishers, Inc., Ann Arbor, Mich., p 21-40 (Chapter 1), 1973.

Descriptors: *Water pollution control, *Waste water disposal, *Model studies, *Computer models, *Sewage treatment, *Networks, Hydrology, Rainfall-runoff relationships, Storm runoff, Pipes, Storage capacity, Sludge treatment, Optimization, Systems analysis, Costs, *Computer programs.
Identifiers: Gradient techniques.

Presented are four computer programs developed by the Norwegian Institute for Water Research for a total analysis and simulation of sewerage systems. The main objectives of these programs, written in FORTRAN, were to characterize wastewater flow through the various components of the sewerage system, to minimize the leakage of wastewater from the system, and to determine economically optimal systems. The four specific models that were developed are presented: (1) Wastewater and stormwater runoff model; (2) wastewater treatment plant model; (3) sludge treatment plant model; and (4) cost analysis program. The network model describes the pattern of stormwater runoff in the sewer network, determining the variation in discharge at any given point in the network for each minute of a given rainfall. Fifteen features built into the model are given. The sewage treatment plant model studies the performance of such plant receiving both sewage and rainwater runoff over a given period. The sludge treatment plant model considers: thickner, anaerobic digestion, aerobic stabilization, sludge centrifuge, sieve band press, and vacuum filters. The optimization technique used is a combination of a trial-and-error approach and a gradient method. The models may be linked together but at present most are operated independently. (Bell-Cornell)

Identifiers: *Regional planning, *Branch-and-Bound strategy, *Regional water systems, Nonlinear programming, Search strategy.

There is presently a trend towards regionalization in water supply and wastewater disposal. This tendency is due to a number of factors, including increases in the cost of transporting wastewater over long distances, an increased use of surface water, and pressure from administrations to form regional systems. The individual parts of a sewerage system--interceptors, pumping stations, treatment plants--show economies of scale indicating that cost savings can be obtained through regional systems. Definite advantages and quantitative benefits are procured from planning, constructing, and operating larger plants. A mathematical formulation of the problem and an algorithm for solution are presented. The problem herein is defined by the question: which is the optimal allocation of wastewater to different wastewater treatment plants, located at different points, so that total costs minus total benefits are minimized. The problem is solved using a simultaneous technical and economic optimization. It is necessary to investigate the largest number of meaningful alternatives without excluding some solutions on the basis of engineering judgment; the best utilization of large quantities of information is warrented. A new planning approach for determination of the optimal solution is presented and applied to the above problem. This technique, the Branch-and-Bound strategy, is compared with traditional methods of regional wastewater system planning. (Bell-Cornell)

WHITHER CLARIFIED SLUDGE. (WOHIN MIT DEM KLAERSCHLAMM.),
R. B. Firnhaber.
Der Papiermacher, Vol 22, No 1, p 12-14, Jan. 20, 1973. 1 fig, 1 tab.

Descriptors: *Sludge disposal, *Pulp wastes, *Incineration, Fuels, Drying, Dewatering, Sludge treatment, Pulp and paper industry, *Waste disposal.
Identifiers: Furnaces.

The possibilities for disposal of clarified industrial sludges by incineration are discussed, including dewatering and drying equipment, furnace designs, and the fuel value of sedimented effluent sludges from paper mills as a function of their chemical composition. In West Germany, 18 million tons of clarifier sludge from effluent treatment are being produced annually with more than 90% water content. As was demonstrated by the city of Zurich, such sludges can be burned together with municipal refuse, provided they are first autoclaved (at 200C and 16 bar pressure) to facilitate their thickening in filter presses to ca. 45% moisture. In: Fourth Sanitary Engineering Conference on Water Distribution Systems, conducted by Illinois Dept of Public Health and Univ of Illinois, February 13-14, 1962, Urbana: University of Illinois Bulletin, Vol 60, No 2, p 6-22, August 1962. 16 fig, 3 tab, 4 ref.

Descriptors: *Water distribution(Applied), *Hydraulics, *Municipal water, sMathematical models, Pipelines, Public utilities, Simulation analysis, Pipe flow, Distribution systems, Computer programs.

Methods for the analysis and design of water distribution systems are reviewed. The use of computers has facilitated this study. A program is available for balancing equivalent pipe lengths. It is feasible to consider writing a design program for a digital computer which would permit direct determination of the best combination of pipes to satisfy prescribed conditions as defined by a generalized equation. APPLICATIONS OF SYSTEM ANALYZERS: A SUMMARY,
Illinois Univ., Urbana. Dept. of Civil Engineering.
M. B. McPherson.
In: Fourth Sanitary Engineering Conference on Water Distribution Systems, conducted by Illinois Dept of Public Health and Univ of Illinois, Feb. 13-14, 1962, Urbana: University of Illinois Bulletin, Vol 60, No 2, p 23-44, August 1962. 11 fig, 4 tab, 48 ref.

Descriptors: *Water distribution(Applied), *Hydraulics, *Design, Analog models, Simulation analysis, Digital computers, Mathematical models, Pipelines, Public utilities, Pipe flow, Distribution systems.

The principal features, advantages, and liabilities of various devices used in calculating the hydraulic performance of water distribution system networks are outlined. With the availability of modern computing devices there is no reason for perfunctory design or arbitrary methods of analysis. A good design contains a degree of flexibility and remains a good design only so long as it is continuously reviewed, revaluated, and modified to conform with obvious departures from previous projections. The analog model is the preferred design tool for network balancing and design, and the digital computer is the preferred tool for system balancing. (See also W74-05006) (Knapp-USGS)
W74-05008

PIPE MATERIALS, COATINGS, AND JOINTS FOR WATER DISTRIBUTION SYSTEMS,
Black and Veatch, Kansas City, Mo. Dept. of Civil Engineering.
H. H. Benjes.
In: Fourth Sanitary Engineering Conference on Water Distribution Systems, conducted by Illinois Dept of Public Health and Univ of Illinois, Feb. 13-14, 1962, Urbana: University of Illinois Bulletin, Vol 60, No 2, p 45-49, August 1962. 18 ref.

Descriptors: *Water distribution(Applied), *Pipelines, *Pipes, *Design, Metal pipes, Concrete pipes, Joints(Connections), Plumbing.

Cast iron or asbestos-cement pipe is ordinarily used in the smaller sizes for distribution systems, although cement-protected steel pipe is generally used in certain cities in the West. Cast iron pipe is the most generally accepted type for small sizes because of its long satisfactory experience record, and its ease of laying and tapping. Cast iron pipe is not suitable for some locations where soil corrosion or electrolysis is detrimental to the use of unprotected metal pipe. In these locations asbestos-cement pipe may be used. In many cities the present trend is not to use cast iron or asbestos-cement for the larger mains because of the brittleness of the materials and the consequent possibility of line breaks when subjected to soil movement, settlement, or shock loads. Asbestos-cement pipe should not be used in tight soils which are subject to shrinkage with changes in moisture content. When used in these locations, the pipe should be completely embedded in granular material. Whenever possible, all materials incorporated in a water distribution system should be selected on the basis of providing reliable service for the long-time needs of the customers served. (See also W74-05006) (Knapp-USGS)
W74-05009

WATER MAIN LAYING,
Kuch and Watson, Inc., Lake Bluff, Ill.
G. T. Watson.
In: Fourth Sanitary Engineering Conference on Water Distribution Systems, conducted by Illinois Dept of Public Health and Univ of Illinois, Feb. 13-14, 1962, Urbana: University of Illinois Bulletin, Vol 60, No 2, p 50-54, August 1962.

Descriptors: *Pipes, *Pipelines, *Construction, Design, Excavation, Distribution systems, Engineering.
Identifiers: *Water main laying.

Methods for careful and proper water main installation are briefly reviewed. Four basic products are cast iron, asbestos-cement, steel, and prestressed concrete water pipe. Basic soil conditions with which to contend in water main installation are clay, loam, peat, granular material, and rock. (See also W74-05006) (Knapp-USGS)
W74-05010

TAPPING, DISINFECTION, AND INSPECTION OF WATER MAINS,
Cedar Rapids Water Works, Iowa.
R. A. Wilford.
In: Fourth Sanitary Engineering Conference on Water Distribution Systems, conducted by Illinois Dept of Public Health and Univ of Illinois, Feb. 13-14, 1962, Urbana: University of Illinois Bulletin, Vol 60, No 2, p 55-59, August 1962. 6 ref.

Descriptors: *Pipes, *Pipelines, *Construction, *Disinfection, Design, Excavation, Distribution systems, Engineering, Water treatment.
Identifiers: *Tapping(Water mains).

Inspection, disinfection, and tapping of water mains are briefly reviewed. The most important thing that an inspector must watch in laying water main is the bedding conditions for the pipe. More failures occur because of poor bedding than for any other single factor. Complete disinfection of a new water main can be obtained if the following measures are taken during and after installation: (1) keep the pipe reasonably clean while laying; (2) cover the end of the pipe after each day so that no small animals can get in; (3) allow plenty of openings so that a velocity of 2 to 3 fps can be obtained when flushing; (4) use a chlorine dosage of at least 10 ppm and allow a contact period of 24 hours; (5) flush well before and after the contact period; and (6) test before turning into service. Tapping water mains is a relatively simple operation,and the methods used for tapping have not changed a great deal for several decades. (See also W74-05006) (Knapp-USGS)
W74-05011

OBSERVING FIRE PROTECTION REQUIREMENTS IN FUTURE WATER SYSTEM DESIGN,
Illinois Inspection Bureau, Chicago.
A. H. Gent.
In: Fourth Sanitary Engineering Conference on Water Distribution Systems, conducted by Illinois Dept of Public Health and Univ of Illinois, Feb. 13-14, 1962, Urbana: University of Illinois Bulletin, Vol 60, No 2, p 60-66, August 1962. 2 tab.

Descriptors: *Water distribution(Applied), *Pipes, *Pipelines, *Cities, Distribution systems.
Identifiers: *Fire protection(Water systems).

The fire protection aspects of several features of water supply design are briefly reviewed. Fire protection reserve provides the volume and the pressure required for public fire protection and supplies private protection facilities such as automatic sprinklers and standpipe systems. This fire reserve should be sufficient to meet the fire service requirements prescribed by the National Board of Fire Underwriters. This fire demand represents a large percentage of the total in small cities, varying from about 80% or more in cities under 5,000 to about 60% in cities of 25,000 population. (See also W74-05006) (Knapp-USGS)
W74-05012

MAINTENANCE OF WATER DISTRIBUTION SYSTEMS,
Jackson Water Dept., Mich.
J. M. Rogeven.
In: Fourth Sanitary Engineering Conference on Water Distribution Systems, conducted by Illinois Dept of Public Health and Univ of Illinois, Feb. 13-14, 1962, Urbana: University of Illinois Bulletin, Vol 60, No 2, p 67-72, August 1962.

Descriptors: *Water distribution(Applied), *Pipes, *Repairing, *Maintenance, Pipelines, Distribution systems, Municipal water.

The best and most economical way to maintain a water distribution system is to have well-trained and well-paid personnel, good records, good reliable equipment, and a complete inventory of repair items. Leaks, large or small, are the most expensive and difficult maintenance jobs. There are several manufacturers of leak clamps for all of the different types of pipes and pipe joints, including a clamp which covers the entire bell. (See also W74-05006) (Knapp-USGS)
W74-05013

VALVES, HYDRANTS, AND MAIN LINE METERS,
Racine Water Dept., Wis.
G. H. Ruston.
In: Fourth Sanitary Engineering Conference on Water Distribution Systems, conducted by Illinois Dept of Public Health and Univ of Illinois, Feb. 13-14, 1962, Urbana: University of Illinois Bulletin, Vol 60, No 2, p 73-78, August 1962. 2 fig.

Descriptors: *Water distribution(Applied), *Valves, *Hydrants, *Water measurement, Instrumentation, Pipes, Distribution systems, Municipal water.
Identifiers: Water meters.

Main-line or master meters provide the means of determining total flow and are the basis for accurate accounting, chemical treatment, and to determine unaccounted water. With accurate main-line meters and accurate meters at the point of consumption, the percentage of loss can be readily determined. Valves should be located uniformly throughout the system in reference to street intersections, such as on property line, curb line, sidewalk line, etc., as these help in locating valves in emergencies. In general, hydrants should be placed with consideration of their possible use as reflected in the local hazards. Hose lines more than 400 to 500 feet long are inefficient and a source of delay. Therefore, hydrants should not be distributed more than 300 to 400 feet from the buildings to be protected. Furthermore, friction losses use up pressures available in hose lines at a rapid rate, and this factor definitely limits the length of hose lines. (See also W74-05006) (Knapp-USGS)
W74-05014

DOMESTIC SERVICE METERS,
Hersey-Sparling Meter Co., Dedham, Mass.
A. R. Moore.
In: Fourth Sanitary Engineering Conference on Water Distribution Systems, conducted by Illinois Dept of Public Health and Univ of Illinois, Feb. 13-14, 1962, Urbana: University of Illinois Bulletin, Vol 60, No 2, p 79-83, August 1962. 7 ref.

Descriptors: *Water measurement, *Instrumentation, *Water distribution(Applied), Maintenance, Distribution systems, Municipal water.
Identifiers: *Water meters.

Water meters commonly used for household, commercial, and industrial services include the positive displacement, velocity, compound, and fire line meters. Proper maintenance of water meters will pay substantial dividends. The larger meters in common use, such as 6-, 8-, and 10-inch compound or fire line meters, should be tested frequently because of the large revenue involved. (See also W74-05006) (Knapp-USGS)
W74-05015

RESERVOIR AERATION IMPROVES WATER QUALITY,
New Hampshire Water Resources Board, Concord.
D. Rapoza.
Public Works, Vol 102, No 5, p 86-87, 1971. 1 tab.

Descriptors: *Water supply, *Quality control, *Aeration, Reservoirs, Costs, New Hampshire, Destratification, Oxygenation.
Identifiers: *Greenville(N.H.), Air Aqua System.

Although New Hampshire's Greenville Reservoir was treated by flocculation, settling, rapid sand filtration, and chlorination, the water was dark from color imparted by decaying organic matter, high iron content turned laundry brown and bleaching attempts resulted in reactions with manganese, turning clothes black; in addition, there was often a strong hydrogen sulfide odor. To improve the water quality a controlled aeration system was designed to lift 150 MG of water from the bottom to the surface per day; the reservoir has a 750 MG capacity of which 213 MG is allocated for water supply. The stabilization and oxygenation effort resulted in better water quality immediately after installation of the equipment, at a cost of $8750. Shore-housed compressors pump air via a total of 4000 ft of polyethylene weighted tubing to eight individually-fed 250-ft lines of valved tubing, also of polyethylene. Air is supplied by eight 3/4-hp electric motor driven compressors. Now the town is getting excellent water in winter as well as summer. Power costs are estimated to be about $90 per month. Chemical costs before the system was installed were reduced to $39.91 per MG in August 1970. (Auen-Wisconsin)

EXPRO '74--A LISTING OF EXTRAMURAL PROJECTS TO BE FUNDED IN FISCAL YEAR 1974.
Environmental Protection Agency, Washington, D.C. Office of Research and Development.
November 1973. 274 p.

Descriptors: *Grants, *Projects, *Research and development, Pollution abatement, Water pollution control.
Identifiers: *Environmental protection agency, Pollution control.

This Environmental Protection Agency (EPA) Extramural Program information bulletin explains how to do business with the Office of Research and Development and provides a listing of tasks planned to be funded as research and demonstration projects during each fiscal year. The Office of Research and Development (OR and D) conducts and supports research, development and demonstration efforts on a wide variety of subjects primarily related to pollution sources and effects, environmental sciences and pollution control technology. OR and D also is responsible for assuring the quality control and standardization of analytical techniques for the Environmental Protection Agency as well as promoting, through technology transfer, the use of new techniques, processes, methodologies, etc., in pollution control. The purpose of this bulletin is twofold: (1) to acquaint the research and development community with general guidelines for working with the EPA's Office of Research and Development under grant or contract support, and (2) to make publicly available a list of specific grant and contract Tasks which OR and D plans to fund during the current Fiscal Year. This listing is planned to be issued at the beginning of each new fiscal year. (Knapp-USGS)

OIL RECOVERY SYSTEM USING SORBENT MATERIAL,
Maloy Labs., Inc., Springfield, Va.
G. D. Gumtz, and T. P. Meloy.
Copy available from GPO Sup Doc as EP1.23:670/2-73-068, $4.00; microfiche from NTIS as PB-229 576 $1.45. Environmental Protection Agency, Technology Series Report, EPA-670/2-73-068, September 1973. 159 p, 20 fig, 6 tab. EPA Project 15080 HET, Contract 68-01-0068.

Descriptors: *Oil spills, Oil pollution, Recycling, *Foam separation, Separation techniques, *Pollution abatement, Ships, *Sorption, Capital costs, Operating costs.
Identifiers: *Oil recovery system, *Sorbents.

The feasibility of recovering oil in slicks 1mm and thicker by the use of recycled sorbents has been shown in laboratory and wave tank tests. Sorbents made of recticulated foam are broadcast on the sea, herded by a boom, picked up by a porous belt and the oil squeezed out of the sorbents by a wringer. The sorbents are then rebroadcast on the sea for further oil recovery. General equations were developed for basic sorption properties, sorbent broadcasting, sorbent herding, sorbent pickup, recovery of oil from the sorbent and for the total system. Based on the laboratory modeling and general equations, the total system concept was developed. It was concluded that one inch cube sorbent particles distributed in a shrouded rectilinear screw fed system was optimal. A 4/1 compression ratio of the slick by a boom herding the sorbent and oil to the channel would work under virtually any wave condition. Capital costs for this system are $216,500 and operating costs $59,500 per year. Economic studies made indicate that recovery cost is about 6 cents per gallon, assuming a system is used 22 days per year and a 20 year depreciation. For large spills the salvage cost of the oil could pay for the operation. The system has a nominal capacity of 5,000 gallons per hour. (EPA)

A BIBLIOGRAPHY ON LEGAL AND REGULATORY ASPECTS OF WATER POLLUTION CONTROL AND ABATEMENT, PART I: ABSTRACTS.
Florida Univ., Gainesville. Coll. of Law.
Available from the National Technical Information Service as PB-222 228-Set, for $40.00 for two parts. September 1972, 809p, OWRR W-130(9075)(1).

Descriptors: *Bibliographies, *Water pollution control, *Pollution abatement, *Regulation, Legal aspects, *Abstracts, Legislation, Water law, Judicial decisions, Jurisdiction, *Water quality control, Water quality standards.

The bibliography of 2,416 abstracts includes, but is not limited to: statutes; state administrative regulations; state judicial decisions; federal statutes; federal administrative regulations; federal judicial decisions; treaties; articles and comments in serial publications; executive orders; monographs; committee reports; congressional hearings and documents; state legislative proceedings; state documents; conference reports; attorney general opinions; interstate compacts; and treaties. All abstracts appearing in the bibliography were prepared between 1968 and 1971. A majority were prepared from materials at the time; however, some documents, particularly judicial decisions, have been included regardless of their chronological date. Moreover, much of the secondary material abstracted relates to or reviews earlier concepts and enactments. All abstracts have been categorized into one of eight subject groups: Foreign and International, Federal Legislation, Federal Regulations, Federal Judicial Decisions, State Legislation, State, Regional and Local Regulations, State Judicial Decisions, and General/Interdisciplinary Analysis. Within the major subject groups abstracts have been further categorized into 42 descriptive topics. (See also W74-05005)

CONTROL OF ALGAE BY MIXING,
New Hampshire Water Supply and Pollution Control Commission, Concord.
H. J. Turner, R. E. Towne, and T. P. Frost.
New England Water Works Association Journal, Vol 86, No 3, p 267-275, 1972. 2 fig, 12 ref.

Descriptors: *Algal control, *Destratification, *Mixing, Methodology, New Hampshire, Cyanophyta, Chlorophyta, Eutrophication.
Identifiers: *Kezar Lake(N.H.), Aphanizomenon.

Copper sulfate controlled Anabaena successfully in Kezar Lake, New Hampshire, but in 1966 it was replaced by Aphanizomenon which proved resistant to copper sulfate. The situation was sufficiently serious to affect lake-front property values, which declined so much that assessment appraisals were reduced as much as 30%. To control the nuisance algae, an economical method was chosen as simple bubbling with air. Four air compressors were installed, each driven by a 3 hp motor, on the shore with 2-inch i.d. plastic pipe leading to the deepest part of the lake (27 ft.). When the compressors were started, the algal cell count was over a million per milliliter near the surface and there was practically no oxygen near the bottom; the Secchi disc reading was 1-1/2 feet. After a month of bubbling, algal cell count dropped below 30,000 cells/ml and Secchi disc readings increased to over 3-1/2 feet. Algal crop composition changed from blue-greens to the less objectionable greens and Secchi disc readings remained in excess of four feet. Observations suggest that mixing may accelerate algal successions and that destratification may have a beneficial long-term effect on a lake. (Jones-Wisconsin)

Descriptors: *Acid mine water, *Mine water, Neutralization, Water pollution, Flow control, *Sealants, *Coal mine wastes, *Pennsylvania, *Slurries, Lime, Pollution abatement, Mine drainage.

Laboratory tests with synthetic acid mine water show the sealing effect of the gelatinous precipitate that forms when hydrated lime or powdered limestone is added in a simulated mine entry closed by a porous barrier. Field tests were conducted in a recently abandoned coal mine. Hydrated lime and limestone slurries were pumped into the mine water behind rubble barriers through 2-inch steel pipes to test the laboratory findings. The outflow was observed at weirs attached to the ends of two 12-inch diameter drain pipes. The results indicated that only temporary sealing of the outflow was achieved and that neutralization took place when the interior water flow conditions were favorable. Placement of the injection outlets, dispersion of the lime slurry, volume of water flowing, and direction of flow in the mine interior to other outlets are important controlling variables that greatly affect the efficiency of the sealing and neutralization of the outflowing acid mine water. GENERAL ENVIRONMENTAL SITING GUIDES FOR NUCLEAR POWER PLANTS -- TOPICS AND BASES, (DRAFT).
Directorate of Regulatory Standards (AEC), Washington, D.C.
October 31, 1973. 130 p, 12 fig, 179 ref.

Descriptors: *Nuclear powerplants, *Sites, Locations, *Regulation, *Environment, *Safety, Ecology, Soils, Geology, Climatology, Hydrology, Public health, Population, *Water pollution control, Water supply.

The development of general environmental siting guides for nuclear powerplants is one of the steps being taken by the United States Atomic Energy Commission to improve the selection of environmentally acceptable sites and to shorten the overall licensing process for light-water reactors. The guides must be based on sound principles of environment management and should be a maximum use to industry and the concerned public in evaluating and improving conventional siting practices. The guides should also be of general value for assessing the desirability and practicality of advanced siting concepts such as nuclear power parks, offshore and lagoon sites for floating plants, and underground and metropolitan sites. (Houser-ORNL)

AEC IMPLEMENTATION OF THE NATIONAL ENVIRONMENTAL POLICY ACT IN ITS LICENSING AND REGULATION OF NUCLEAR FACILITIES,
Division of Radiological and Environmental Protection (AEC), Washington, D.C.
L. R. Rogers, and C. L. Henderson.
In: CONF-710501-P1 -- Proceedings of the Third National Symposium on Radioecology, May 10-12, 1971, Oak Ridge, Tenn. p 63-67. (1971).

Descriptors: *Law enforcement, *Legislation, Management, *Legal aspects, *Regulation, *Administration, Administrative agencies, *Standards, Safety, Population, Public health, Environment, Radiation, Water, Water quality, Air, Soils, Organizations.
Identifiers: *National Environmental Policy Act.

In response to growing public awareness and concern for protection of the natural environment, the federal government enacted on January 1, 1970, the most comprehensive and far reaching of the several federal statutes directed specifically toward the protection of the environment. The statute is known as the National Environmental Policy Act of 1969, or NEPA. Broadly speaking, the Act makes it the continuing responsibility of the federal government to use all practicable means, consistent with other essential considerations of national policy, to improve and coordinate federal plans, functions, programs, and resources toward certain stated ends of environmental protection. An AEC policy statement for implementing NEPA is discussed. One of the underlying themes in the new policy statement is that the preservation of environmental values can best be accomplished through the establishment of environmental quality standards and requirements by appropriate federal, state, and regional agencies having responsibility for environmental protection, and the AEC urges that these agencies proceed promptly to establish such standards. A draft of 'Guide to the Preparation of Environmental Reports for Nuclear Power Plants' has been prepared and issued for comment and interim use. (See also W74-05181) (Houser-ORNL)

SYSTEMS ANALYSIS FOR ENVIRONMENTAL POLLUTION CONTROL,
Michigan Univ., Ann Arbor. School of Public Health.
R. A. Deininger.
In: Models for Environmental Pollution Control (Ed. by R. A. Deininger), Ann Arbor Science Publishers, Inc., Ann Arbor, Michigan, p 3-18 (Introduction), 1973. 88 ref.

Descriptors: *Systems analysis, *Mathematical models, *Environmental control, *Water pollution control, *Pollution abatement, Solid wastes, Disposal, Air pollution, Optimization, Simulation analysis, Stochastic processes, Digital computers.

In this introductory chapter, Deininger discusses the use of systems analysis and mathematical modeling for formulating and solving problems of environmental pollution. He defines the systems approach and considers seven standard steps in a systems analysis study. They include: (1) problem formulation; (2) model construction; (3) definition of criterion function; (4) data collection; (5) derivation of optimal solutions; (6) model, solution, and sensitivity testing; and (7) implementation of the best solution. Next, Deininger acknowledges the techniques and tools of systems analysis, i.e., optimization; linear, non-linear, and dynamic programming; stochastic and integer programming; queueing theory; simulation and network techniques; PERT, CPM; gradient techniques; and digital computers. This paper then examines water pollution problems--with special attention paid to the historic development of the use of systems analysis--then solid waste disposal problems, and then air pollution problems. Finally, Deininger looks at total and global environmental models and summarizes current modeling efforts. (Bell-Cornell)

INTRODUCTION TO SIMULATION TECHNIQUES,
California Univ., Davis. Dept. of Civil Engineering.
G. T. Orlob.
In: Models for Environmental Pollution Control (Ed. by R. A. Deininger), Ann Arbor Science Publishers, Inc., Ann Arbor, Mich., p 91-105 (Chapter 4), 1973. 5 fig, 10 equ, 11 ref.

Descriptors: *Simulation analysis, *Aquatic environment, *Water pollution control, *Planning, *Methodology, River basins, Estuaries, Reservoirs, Mathematical models, Hydrology, Systems analysis.

A basic approach to simulation of the aquatic environment that has proven to be practical in pollution control planning is outlined in detail. There are three fundamental steps in model design: conceptual, functional, and computational representation. A discussion of the first two steps serves to illustrate the model development procedure, the third step being out of the scope of this paper. Under conceptual representation, determining model scale and discretizing the system are considered. Within the functional representation, advection-diffusion equations, the effects of scale, mass conservation equations, and motion and continuity are discussed. (Computational representation includes selecting a solution technique and forming input and output.) Included as illustrative examples in this simulation study are the Texas Water Plan, model idealization of a river basin, conceptual representation of a reservoir, and the San Francisco Bay-Delta estuarial mathematical model network, including a definition sketch--WRE node-link estuarial model. Following this approach, useful models have been developed for many classes of problems and are now being applied in planning studies in the United States. Among those that may be cited are models for: stream water quality; reservoir temperature; estuarial hydrodynamics and quality; groundwater quality; and aquatic ecology. (Bell-Cornell)

TOTAL ENVIRONMENTAL QUALITY MANAGEMENT MODELS,
Resources for the Future, Inc., Washington, D.C.
W. O. Spofford, Jr.
In: Models for Environmental Pollution Control (Ed. by R. A. Deininger), Ann Arbor Science Publishers, Inc., Ann Arbor, Mich., p 403-436 (Chapter 19), 1973. 2 fig, 1 tab, 36 equ, 49 ref.

Descriptors: Environment, *Quality control, *Management, *Model studies, *Water quality, *Wastes, Air pollution, Waste disposal, Regions, Systems analysis, Optimization, Simulation analysis.
Identifiers: Residuals management, *Environmental quality, Nonlinear programming.

The effort to integrate models of air and water pollution and solid waste disposal into an overall environmental quality model is described. The term 'total environmental quality management models' is defined as meaning 'regional residuals-environmental quality management models,' where these include only the impacts on environmental quality of residuals discharges to the air, water, and land environments. The term 'residual' is preferred here to that of 'waste.' The entire regional residuals management system is delineated, including the range of management options available to society for improving environmental quality; indicated is how all the system components may be expressed and ultimately linked together within the same computational framework. The residuals management model is discussed qualitatively and then formulated quantitatively; mathematical forms of the various environmental models are discussed, and computational schemes for selecting an optimal management strategy are suggested. Included are: residuals generation and discharge models; environmental modification and environmental quality models; a management model formulation and a procedure for optimizing a nonlinear objective function subject to a set of linear constraints; an atmospheric dispersion model; an aquatic ecosystem model; and more optimization procedures, including a heuristic approach. The regional residuals management model suggested herein is more complex than the classical management model approach, and it requires a substantial amount of computer resources. (Bell-Cornell)

Report UCLA-ENG-7390, November 1973. 75 p, 2 fig, 2 tab, 17 ref, 2 append. USDI Contract 14-06-200-5882A.

Descriptors: *Reservoir operation, *Optimization, Dynamic programming, California, Linear programming, Least squares method, Streamflow forecasting, Bibliographies, Abstracts, Systems analysis, Water management(Applied).
Identifiers: *California Central Valley Project.

Dynamic programming was studied for use in selection of an optimal reservoir storage policy path through a specified number of policy periods, and linear programming for use in period by period optimization. The policy periods, in case of the real time operation, correspond to the number of time periods for which a streamflow prediction model is reasonably reliable. The method results in relatively easy computer implementation and high flexibility, in that changes in constraints are simply made and additional reservoirs easily added. The method is useful for the determination of release policies in real time operation of an existing system. The methods are demonstrated in a real system of reservoirs and hydroelectric facilities associated with the Shasta, Trinity and Folsom subsystems of the California Central Valley Project. The two-stage least squares estimation method gives unbiased estimators when the system is described by a set of simultaneous equations in which each equation contains several dependent variables, which also occur in other equations. In Shasta and Clair Engle reservoirs California, the dependent variables are the February to July inflows while the independent variables include snow-water contents and precipitation indices at several stations within the two watersheds. An annotated bibliography was compiled of the available practical techniques for considering the adverse effects of daily and weekly operations on the risk of not meeting firm water and power commitments at some future date. SYSTEMS ANALYSIS: A DECISION-MAKING TOOL FOR ARID LAND DEVELOPMENT,
Arizona Univ., Tucson. Dept. of Watershed Management.
M. M. Fogel.
In: Agricultural Aspects of Arid and Semi-arid Zones, CENTRO seminar, 1972, p 268-277. 2 tab.

Descriptors: *Land development, *Decision making, *Operations research, *Systems analysis, *Arid lands, Agriculture, Land management, Land use, Management, Planning, Alternate planning, Optimization, Risks, Scheduling, Simulation analysis, Hydrologic systems, Model studies.

Arid land development is an integral part of water resources development planning, entailing the selection of certain alternate procedures in light of a given set of parameters. The selection process may be facilitated by using operations research, systems analysis or decision analysis as a tool. Examples of such use are illustrated by a watershed problem, where plans to induce runoff need to be studied for their effects, and an agricultural problem with irrigation scheduling constraints. The techniques involved are still relatively new, leaving to the ingenuity of the planner a key part of the decision process. The systems analyst makes the decision-making process easier by showing the

;sults of each alternative choice as it relates to ie solution of the given problem and to yproducts of the decision. (Muller-Arizona)

In: Models for Environmental Pollution Control (Ed. by R. A. Deininger), Ann Arbor Science Publishers, Inc., Ann Arbor, Mich., p 181-196 (Chapter 8), 1973. 4 fig, 3 tab.

Descriptors: Water resources development, *Water users, *Weirs, *Canals, Construction, *Cost-benefit analysis, *Simulation analysis, *Water supply, Rivers, Reservoirs, Water quantity, Water quality, Navigation, Computer programs, Investment, Pricing, Mathematical models, Systems analysis.
Identifiers: *Economic analysis, Receiving water capacity.

An approach is presented for determining the net benefits accruing to urban, industrial, and agricultural water users from the construction of weirs and canals for navigation purposes. Included is an economic appraisal of changes in water use caused by such investment. Canals and weirs influence the water supply and receiving water capacity of a channel-reservoir system; the major consequences of such construction are alterations of water supply in quantitative and in qualitative terms and an alteration of the receiving water capacity. These alterations affect water utilization (except when they occur within the range of excessive quantity or quality) and are economically relevant in the form of costs and benefits. The approach presented combines cost-benefit analysis and a five-element simulation model to derive the physical benefits accruing to water users. On the basis of this model, a computer program was developed that was tested for two sections of the German system of domestic waterways. The next step is to develop a general model for transforming the net benefits in physical terms into net monetary benefits. Thus far, only the basic pricing concept has been developed, which is based upon an opportunity cost approach. (Bell-Cornell)

MATHEMATICAL APPROACH TO WATER RESOURCES MANAGEMENT IN ITALY,
Consiglio Nazionale delle Ricerche, Rome (Italy). Inst. for Water Research.
M. Benedini.
In: Models for Environmental Pollution Control (Ed. by R. A. Deininger), Ann Arbor Science Publishers, Inc., Ann Arbor, Mich., p 205-215 (Chapter 10), 1973.

Descriptors: Water resources development, *Management, *Water supply, *Hydroelectric power, *Simulation analysis, *Irrigation, *Water demand, *Water quality control, *Reservoirs, Seasonal, Dams, Downstream, Reach(Streams), Flow, Optimization, Mathematical models, Systems analysis.
Identifiers: *Italy(Tiber River).

The principle aspects of water resources management in Italy are discussed, and simulation and optimization techniques applied to existing problems are described; there is an increasing demand (in the face of scarce supplies) for domestic, irrigation, and industrial water, with the need for increasing the individual income. Needed also are large treatment plants for the reuse of wastewaters. But management of Italian water resources now consists mainly of settling conflicts between existing uses, rather than planning new hydraulic works. Hydroelectric power production suffers from limitations imposed by flood control needs. Described is a simulation model, based on a continuity equation, which can be used with both historical and synthetic hydrological input, as well as in a deterministic and probabilistic manner. Difficulties of mathematical and economic evaluation of water uses in Italy are considered. Problems of irrigation water demand, water supply, pollution, and water quality are discussed, considering the application of optimization and simulation modeling. Finally, the work of the 'Istituto di Ricerca sulle Acque' in developing methodologies for studying integrated utilization of the resources in a large catchment area is reported. The area chosen for study was that of the Tiber River. (Bell-Cornell)

WATER RESOURCES AS A BASIS FOR COMPREHENSIVE PLANNING AND DEVELOPMENT IN THE CHRISTINA RIVER BASIN,
Delaware Univ., Newark. Water Resources Center.
J. Tourbier.
Available from the National Technical Information Service as PB-228 853, $13.75 in paper copy, $1.45 in microfiche. Final Report. April 1973. 199 p, 34 fig, 5 append. OWRR C-2185(3382) (1).

Descriptors: *Comprehensive planning, Water resources development, *Model studies, *Land use, *Urban hydrology, Surface waters, Subsur-

face waters, Percolation, Permeability, Urbanization, Land classification, *Delaware, Systems analysis, Planning.
Identifiers: Urban water resources protection, *Christina River Basin(Delaware), *Environmental protection measures, Land use policy, Non-point source pollution.

The Christina River Basin near Wilmington, Delaware was used as a model area to determine methods that could be used by the public sector through its planning and regulatory powers to first assess the impact of land development upon water resources and certain hydrologic phenomena and then to create a responsive land use policy and program. The impact of urban development on the natural pattern of water flow is a function of 2 sets of variables, the natural characteristics of the land and the type and intensity of development. Land areas were classified into categories called site classes on the basis of the properties that influenced the water regimen. Land uses were described in terms of their water-related impact. A computer program then related environmental protection measures, measures that can be incorporated into development while it proceeds, to the variables of site class and land use intensity. The cost distribution of these measures was used to evaluate regional land use policies and to indicate areas of natural resources limitations to development, to allow for guidance of land uses to areas where they would do the least damage. The program is heavily reliant on protection measures and their cost as an indication of problem areas. The selection of measures requires an assessment of the impact of land uses on hydrologic processes, a definition of levels of quality to be achieved, and the quantification of amelioration measures. The costing of protection measures requires specifications for construction. (Hoffman-North Carolina)

NORTH CAROLINA WATER PLAN-PROGRESS REPORT-CHAPTER 22, WATER BASED RECREATION.
North Carolina Dept. of Natural and Economic Resources, Raleigh. Office of Water and Air Resources.
Draft. April 1973. 182 p, 8 fig, 36 tab, 182 ref, 4 append. Title III PL 89-80. Water Res. Plan. Act 1965.

Descriptors: Recreation, *Recreational demand, *Recreation facilities, *Water demand, *North Carolina, Water sports, Bodies of water, Economics, Land use, Natural resources, Water management, Reservoirs, Lakes, Environment, Water resources, Model studies, Rivers.
Identifiers: *Leisure, Recreation resource base, Simulation.

Demand for outdoor recreational facilities is increasing due to higher family income, increased mobility, leisure time, and population. North Carolina, with its varied water resources, provides recreational opportunities. A North Carolina comprehensive outdoor recreation plan recommends providing outdoor opportunities, preserving recreational areas, and achieving these functions in the best way. Recreational demand is concentrated primarily along the Piedmont Crescent. While an adequate recreational resource base is needed, distribution of bases in relation to population centers is also needed, as is quality of the base and time period when the resource is used. This study attempts to simulate visitation patterns around major lakes and reservoirs. It is estimated that 70% of visitors are from North Carolina. It also found that some areas with high recreational demand have few recreational opportunities. Federal attempts in recreational development, such as the National Park System, are discussed, as are lakeshore development, economic consideration, and other related topics. Recommendations presented include increasing public access to recreational areas, preserving natural resources, and balancing water-based recreational planning. Tables detailing recreational areas, (i.e. inland water bodies, farm ponds, fishing streams, coastal beaches) a description of simulation model utilized and a brief description of federal programs concerned with recreation are in the appendices. (Grden-North Carolina)

PRATTVILLE, ALABAMA, COMMUNITY DEVELOPMENT PLAN, VOLUME I: TEXT.
Central Alabama Regional Planning and Development Commission, Montgomery.
Final report. June, 1973. 250 p, 59 tab, 2 append. ALA-RX09-1020-0.

Descriptors: *Comprehensive planning, *Water management(Applied), *Drainage programs, *Water supply, Sewage, *Sewage treatment, Programs, Water, Water pollution control, Environmental effects, Channel improvement, *Alabama, *Community development.
Identifiers: Prattville(Ala.), Augusta Creek(Ala.), Alabama River.

Between 1963 and 1973 the population of Prattville grew by 98%. This growth is expected to continue, although at a declining rate of 5% per year. The comprehensive community development plan was undertaken to provide a framework for the future development of the Prattville urban community systems of land use, streets and highways, community utilities, community facilities, and public improvements. Recommendations are based upon interrelationships between subsystems of these systems. It is recommended that Prattville continue to draw upon underground wells for its drinking water supply. The water is of good quality; pollution of ground water supplies should not be a problem due to their depth and the natural purification from percolation. The storm drainage plan, based on 25 year storm data, proposes to utilize natural drainage courses, which to ensure continuation of natural stream life, will not be lined with concrete. A mandatory land dedication policy for drainageways also proposed. Sewage treatment capacity, under the plan, will be increased, not only to provide secondary treatment but also to eliminate the overflow of raw sewage presently being discharged into Augusta Creek. An interim plan for water pollution control abatement in Augusta Creek and the Alabama River is included. (Hoffman-North Carolina)

Recreation is an important component of the w of life in the Netherlands due to a rise in prospe ty, shorter working hours, an increase of autom bile use, and higher education levels. A recreati plan for Oostelijk Flevoland, a polder reclaim from the sea, is based upon dike delineation, lan scape design, recreational needs, and soil type This plan includes aquatic sports areas, shores a beaches, woods, planted areas, nature terrair sojourn accommodations, and special points of traction. A chain of border lakes has been creat between the polders and the mainland offeri many aquatic sports. Beaches have be developed along the dikes, together with sewerage system to keep the water clean. Plant and wooded areas integrate agricultural a recreational areas. Meadow bird reserves, whe the ground water has been artifically raised, fis ing places, and the Oecological Reserve for stud ing the natural succession of plant and animal l have been created. Other special attractions clude an agricultural exhibition, game parks f hoofed animals, and a museum depicting the his ry of land reclamation in the Netherlands. W this recreation plan, the Oostelijk Flevoland hop to enhance the Dutch way of life. (Grden-No Carolina)

CALIFORNIA UNDERSEA AQUEDU RECONNAISSANCE: THE OCEANOGRAP (CUARO),
Naval Undersea Center, San Diego, Calif.
R. H. Riffenburgh.
Available from NTIS as AD-768 730, $5.75 paper copy. Report No NUC TP 353, August 19 158 p, 41 fig, 10 tab, 36 ref.

Descriptors: California, *Aqueducts, Underwat Waves(Water), Surges, Tsunamis, Densi Coastal engineering, Freshwater, Oceanography Identifiers: California Undersea Aqueduct.

The possibility is discussed of conveying fr water from northern to southern California vi subsurface offshore aqueduct (The California U dersea Aqueduct). The specific region investiga was between Crescent City and San Diego fr the 20- to 200-m depth contour. Available data relevant variables were analyzed to provide inf mation for aqueduct planning decisions. The va bles and analyses most influential in planning California Undersea Aqueduct were divided in two categories: variables influencing the 100-y survival of the aqueduct (century risks) and va bles influencing the construction and maintenan of the aqueduct. Waves, surges, tsunamis, den ty, and light do not appear on the basis of rec naissance data to pose insurmountable proble Surface, water column, and bottom currents, cluding upwelling and internal wave phenome may or may not be prohibitive; data are adequate, and additional information must be tained from in situ observations. Canyons are an insurmountable threat, but will pose innovat engineering challenges and probably be quite pensive. Additional data will also be required these processes. (Sinha - OEIS)

entifiers: *Broome County(New York).

ie 43 existing separate public water systems in e County should be consolidated into one Partounty Water District. The single district would corporate the water systems of the City of nghamton, the Villages of Endicott and Johnson ty, and the Towns of Binghamton, Chenango, nklin, Dickinson, Fenton, Kirkwood, Maine, nion, Vestal, and Windsor. The general outline the proposed district is shown. The forming of e water agency would eliminate all of the weaksses that abound when there are 43 neighboring stems going their separate ways. The 43 systems w have available as much water as will be eded in 2017. While the cost of almost erything will multiply, the cost of water in 2017 need be no higher than it was in 1967. The establishment of a single water agency would save time, money, man-power, machines and materials plus intergovernmental paper-work and delay for all concerned. Every consumer in the new water union would immediately achieve fair and equal status. The person in dire need of water would be spared the long and arduous process of petition and public hearing before his town board. In some existing cases, even more time is lost because the town board has to petition a second municipality to provide water service. A description of the proposed water agency, customer charges, and a listing of advantages and specific recommendations are included. (Poertner)

Descriptors: *Project post evaluation, *Civil engineering, *Social impact, *Economic impact, *Sewerage, *Sewage districts, Urban sociology, Methodology, Waste water disposal, Assessments, Pennsylvania.
Identifiers: *Impact analysis, Pittsburgh.

An overview is given of the principal issues encountered during a study of the impacts of the regional sewage collection and treatment system serving the Greater Pittsburgh Area. This study was one part of a research project of the American Society of Civil Engineers titled 'Impact of Civil Engineering Projects on People and Nature'. The purpose of the ASCE study was to identify and study the impacts of several real-world civil engineering projects and programs. The ASCE envisions that, through subsequent planned studies, a methodology can be developed that will aid planners, designers and public officials to predict the probable impacts of civil engineering projects and programs far in advance of development and implementation. The subject of this report is the Allegheny County Sanitary Authority which serves about 1.2 million people in Allegheny County, Pennsylvania. The approaches used and the issues that guided the study and emerged from the study are discussed. The various impacts investigated included upstream impacts, downstream impacts and treatment plant impacts. Investigations undertaken included study of social, economic, political and physical impacts attributable to the development and operation of the Allegheny County Sanitary Authority. Additional studies are needed to identify and analyze the impacts of the Authority to aid in the development of study methodology for analyzing impacts of other types of civil engineering projects. Descriptors: Water resources development, *Management, *Water supply, Methodology, *Regional analysis, *Comprehensive planning, *Political aspects, Social aspects, Hydrologic aspects, Economics, *River basin development, Cost-benefit analysis, Simulation analysis, Forecasting, Agriculture, Mathematical models, Systems analysis.
Identifiers: *France.

An approach to water resources management is presented which abandons traditional mathematical programming with a unique objective function for a more highly comprehensive procedure. The complete hydrological basin from the source to the sea should be accepted as the basic geographical unit since it is usually an administrative and political unit. When a basin water supply manager hears that water is needed to irrigate an additional million acres, the question is not how to minimize the cost and optimize the benefit, but rather, politically-based, why another million acres should be irrigated. Possible answers are: to produce agricultural goods for domestic consumption; (2) to sell these products abroad; or (3) to create a need for labor. The distribution of charges between activity and group is different from one case to another. The inadequacy of cost-benefit analysis is discussed. A methodology for river basin development being used in France is described. A basic principle is that future water needs depend on the perspectives of regional development (determining economic and social perspectives on the basis of optimum valorization of water resources is possible only when water is scarce, as in arid zones). Four phases of the methodology are distinguished: (1) hypothesis for basin development; (2) forecast model; (3) simulation model; and (4) finance model (evaluates overall cost of each of the preceding solutions). Identifiers: Western U.S.

Development of natural resources in the Western United States is dependent upon availability of water supplies. A large potential for the industrial development of eastern Montana, northeastern Wyoming, western North Dakota, and northwestern South Dakota exists in the vast deposits of lignite and sub-bituminous coal within the Upper Missouri River basin. Interest appears to be in using this coal in a dual-energy capacity. It can be converted to electrical energy or synthetic hydrocarbons, gasoline, and natural gas substitutes. Water is necessary to meet this technological development. (Knapp-USGS)

PUBLIC WATER SUPPLIES OF NORTH CAROLINA: PART 2. SOUTHERN PIEDMONT,
Geological Survey, Raleigh, N.C.
N. M. Jackson, Jr.
North Carolina Department of Natural and Economic Resources, Office of Water and Air Resources Publication, July 1973. 255 p, 4 fig, 6 ref.

Descriptors: *Water supply, *North Carolina, Water quality, Water resources, Municipal water, Water sources, Water works, Water distribution(Applied).

Information about the public water supplies in 18 counties in the southern Piedmont section of North Carolina is compiled; this information should be useful to planners and water managers concerned with water-supply availability, water-resources development, and water quality. A water-resources appraisal and a map of each county shows the general area served by public water supplies and an inventory of each public supply in the county with 500 or more customers. The appraisal includes the population served, the adjacent communities served, the number of metered customers, the source of water, estimated allowable draft, total and industrial water use, raw and finished water storage, raw and finished water-pumping capacity, future plans, a water-resources appraisal in the immediate vicinity of the supply, and the results of chemical analyses of raw and finished water. A TREATISE ON CENTRALIZED MANAGEMENT OF WATER RESOURCES,
University of Southern Mississippi, Hattiesburg. Dept. of Economics.
D. C. Williams, Jr., and C. P. Cartee.
In: Watersheds in Transition; Proceedings of Symposium held at Fort Collins, Colo, June 19-1972: Urbana, Illinois, American Water Resources Association Proceedings Series, No 14, p 71-1972. 1 fig, 1 tab, 5 ref. OWRR A-041-MISS (2).

Descriptors: *Water management(Applied), *Mississippi, *Planning, *State government, Federal government, *Governmental interrelations, Political aspects, Organizations, Administration.

Centralized water resource planning at the state level in Mississippi has been an evolutionary process and one that is still not complete. The process has been complicated to some degree by the number, function and organization of federal, state and local agencies involved. The results have been fragmentation, duplication and redundancy in planning, promotion, development and management of water resources. Some of the causative factors leading to this situation and their ramifications are analyzed. A suggested structure of reorganization is also provided for water resource agencies to the state as an alternative to eliminate or alleviate some of the problems. (Knapp-USG

PUBLIC CONTROL AND REGULATION,
Melbourne Univ., Parkville (Australia).
S. D. Clark.
In: NWWA International Groundwater Symposium on 'Groundwater-the Forgotten Resource', November 20-22, 1973, held at Macquarie University, Sydney, Australia. 12 p, 7 ref.

Descriptors: *Regulation, *Management, *Legal aspects, *Water law, *Water policy, Planning, Water resources development, Legislation, *Governments, Groundwater.
Identifiers: *Licensing, Government control, Appeal boards, Protected zones.

Governmental control of groundwater is discussed, beginning with a definition of government as registrar and grantor of rights. The fiscal, social, and political factors influencing management are explored, concluding that only government can put together the necessary capital and human resources to plan, coordinate and execute major water development programs. The development of laws concerning surface water and groundwater is summarized, including factors dictating government control of these resources. An outline of modern groundwater legislation is presented, with special attention to the following: Declaration of State title, licensing of bore construction, licensing of drillers, licensing of extraction and waste disposal, declaration of protected zones, appeal boards, and survey provisions. URBAN WATER RESOURCES--POLITICS OF MANAGEMENT,
Bacon and Thomas, Washington, D.C.
F. B. Francois.
Preprint No 1876, American Society of Civil Engineers, ASCE National Water Resources Engineering Meeting, Washington, D.C., January 29-February 2, 1973. 18 p.

Descriptors: *Water resources development, *Governments, *Political aspects, *Local governments, Political constraints, State governments, Federal government, Legislation, Institutions, Administration, Sanitary engineering, Water supply, Waste disposal, City planning, Regional development, History, Urbanization, Cities.

The need for water has progressed to the point where water resources management is no longer a simple issue to be determined by a select group of individuals. The needs for water have grown, and new forces have entered into the picture to formulate policies for wise use of the limited resources available. Water management in the past was left up to the individual, at first, when private wells supplied the water and privies were widespread. Later, as wells and springs became contaminated, the cities began to enter into the picture of water management. Even so, progress was slow, and sewage treatment facilities were often lacking. The superior political strength of the state governments relative to the cities resulted in some states establishing regional authorities to handle the problems. The federal Government, however, remained largely detached from the entire activity until recently. Now, federal standards are being imposed on local governments as a result of the realization that local governments needed assistance to establish adequate programs. Along with federal standards has come a new approach to the allocation of resources. Social, political, economic and other questions are being added to the scope of the planners' duties. (Poertner)

RIVERBANKS IMPROVEMENT PROGRAM,
Broome County Planning Dept., Binghampton, N.Y.
W. McGrath.
Southern Tier East Regional Planning Board, Binghampton, New York, February 1972. 20 p, 6 fig, 18 ref.

Descriptors: *Rivers, *River basin development, *Land management, *Flood plain zoning, *New York, River regulation, Water pollution control, Comprehensive planning, Water resources development, Floodways, Flood control, Parks, Land use, Land development, Urbanization, Conservation, Recreation facilities.
Identifiers: *Broome County(New York), *Tioga County(New York), Riverbank improvement.

Guided by the initial efforts of the Broome County Planning Department, the Southern Tier East Regional Planning Board has initiated a riverbanks improvement program of preservation and recreational development for Broome and Tioga Counties. The report is a brief description of factors which have influenced the program. Included within this framework is the concept of the program at its inception, current program status, and future program goals and objectives. There are approximately 120 miles of river segments traversing the Broome-Tioga area. Segment lengths range from a seven mile portion of the Delaware River in southeastern Broome County to a sixty mile section of the Susquehanna River which passes through the heart of the most densely populated portions of western Broome and eastern Tioga. In all, five rivers, the Chenango, Delaware, Otselic, Susquehanna, and the Tioughnioga, along with their constituent brooks and creeks, form the drainage basin for the two-county region. Although construction in floodable areas along the rivers has been discouraged by planning officials and municipalities through zoning ordinances, the desired effect has not been achieved. A list is included of the principles and policies established by the Southern Tier East Regional Planning Board. These were adopted in the formation of the Riverbanks Improvement Program for the two-county region. Initial efforts toward acquisition of specific sites along the riverbanks for recreational, educational and conservation uses are mentioned. Various financing programs of federal agencies are listed as possible sources of funds for land acquisition and development of open spaces, parks and conservation projects. (Poertner)

FLOOD PROOFING REGULATIONS FOR BUILDING CODES,
Army Engineer District, Pittsburgh, Pa.
A. C. Lardieri.
*Floodproofing, *Building codes, *Legal aspects, Flood damage, Legislation, Design criteria, Regulations, Design standards, Flood protection, Flood plain zoning, Flood control, Floods, Flood stages, Flood plain insurance.

Few building codes require flood-proofing of new or existing structures as a condition for flood hazard area construction or occupancy. Thousands of structures in the United States are located in flood plains and many are partially or totally unprotected from the damages of flooding. Six methods of flood plain management involving non-structural alternatives are: (1) construction of flood protection works such as dams and levees, (2) flood insurance, (3) flood disaster relief, (4) flood plain regulation, (5) government purchase of flood prone land, and (6) flood-proofing. Flood-proofing is the least well known of these methods. It can be incorporated in building codes and complement other approaches to flood control. It is most useful at the fringes of flood prone areas, where the cost of flood-proofing would be minimal, encroachment on the floodway would be negligible, and the threat to life would be minimized. A reference flood level datum should be determined for equitable application of flood-proofing requirements. Regulations should allow for the use of alternative methods of achieving minimum established goals. (Poertner)

AESTHETICS IN ENVIRONMENTAL PLANNING.
Stanford Research Inst., Menlo Park, Calif. Operational Evaluation Dept.
Copy available from GPO Sup Doc as EP1.23:600/5-73-009, $2.05; microfiche from NTIS as PB-229 574 $1.45. Environmental Protection Agency, Socioeconomic Studies Series, Report EPA-600/5-73-009, November 1973. 187 p, 6 fig, 4 tab, 217 ref. EPA Program. Element 1HA098.

Descriptors: *Aesthetics, *Environmental effects, Quality control, Decision making, Design standards, Design criteria, *Planning, Federal agencies, Federal reservations, *Regional analysis, *City planning, Scenery, *Research priorities, Management, *Social impact, *Attitudes.

Three primary aspects of the aesthetic concept are discussed: aesthetics and the human senses, aesthetics as thinking about the arts, and aesthetics as the science of beauty. Additional factors underlying the concept of aesthetics include: nature as an underlying force; cultural, social and economic phenomena as determiners of aesthetic expression; and aesthetics of American city life. Aesthetics is also discussed in the context of the National Environmental Policy Act. The following research projects are suggested: (1) Development of criteria for evaluating methodologies designed to assess aesthetic impacts--special emphasis on objectivity, secondary impacts, and aesthetics as an interrelated aspect of all environmental elements. (2) Increased emphasis on user preference studies for understanding individual attitudes and group values about aesthetic characteristics in the environment. (3) Development of aesthetic quality indicators for different levels of concern (national, state-regional, community-local) and devise monitoring techniques. (4) Development of methods for communicating aesthetic effects of changes resulting from planned activities--simulation labs for visual and auditory impacts. (5) Development of an information system for source material on aesthetic research. (EPA)

MAN'S ENVIRONMENT AND THE ATLANTIC ALLIANCE,
J. R. Huntley.
NATO Information Service: Brussels, Belgium. 1972. 2nd Ed, 62 p, Illus.
Identifiers: Books, Cities, *Environment, Health, Mans, *NATO, Safety, Society, *Water pollution, *Oil spills, *Coastal pollution.

The relationship between man's environment and the Atlantic Alliance is described. The origin of the idea for considering human environmental problems and the establishment of a Committee on the Challenges of Modern Society (CCMS) are discussed. The next section, shaping the human environment, discusses some indicators of problems, why it is an international crisis, and the ecological crisis in advanced nations. The areas in which NATO is working in the environment field: oil spills, coastal water pollution, inland water pollution, the clean engine, air pollution control, the experimental safety vehicle, aspects of road safety, disaster assistance, environment and regional development, scientific knowledge and decision-making, cities, the misuse of drugs, advanced health care, advanced waste water treatment, and environmental fellowships are discussed. A section is then included explaining the reasons why NATO is involved in this undertaking, followed by an explanation of the CCMS concepts and methods. A final section discusses the future of CCMS, including present results and prospects for the future. Three appendixes contain the following information: CCMS chronology, NATO/CCMS publications, and USA/Federal Republic of Germany bilateral agreement on the experimental safety vehicle.--Copyright 1973, Biological Abstracts, Inc.

THE CHALLENGE OF ENVIRONMENTAL PROTECTION AND INDUSTRIAL DEVELOPMENT,
National Water Well Association, Houston, Tec. Research Facility.
M. D. Campbell, and W. A. Hunt.
In: NWWA International Groundwater Symposium on 'Groundwater-the Forgotten Resource', November 20-22, 1973, held at Macquarie University, Sydney, Australia. 12 p.

Descriptors: Water resources development, Supply, *Water management(Applied), *Planning, *Water demand, *Water requirements, Industrial plants, Feasibility, *Management, Economics.
Identifiers: Private water supplies, Private motives, Government motives, Centralized service, Decentralized service, Contractual service, *Environmental protection.

The need for private water supplies is well established. The subsequent question of when and where private water systems are applicable is discussed. Economic and logistic feasibility are discussed, as well as public health interests, as a function of population density. The private and government motives for developmental and regulatory roles are explored, as well as the comparison between private systems and industrial requirements. Special attention is given to operation and maintenance systems, focusing on the following: implementation, centralized and decentralized service, contractual services, selection of an organizational structure, geography, politics, income level of users, education level and motivation of users, and management. MEASURING IMPACTS OF WATER RESOURCE DEVELOPMENTS ON THE HUMAN ENVIRONMENT,
Battelle-Memorial Inst., Columbus, Ohio.
J. K. Baker, and J. R. Finley.
Water Resources Bulletin, Vol 10, No 1, p 10-21, February 1974. 4 fig.

Descriptors: *Water resources development, *Social impact, *Economic impact, Social values, Employment opportunities, Environment, Psychological aspects.
Identifiers: *Human environment, *Environment impact.

An approach to measuring impacts of water resource developments on the human environment is described. This evaluation system employs a two-step assessment process. The first step is an assessment of the nature and magnitude of the impacts as reflected by parameter value estimates without and with the proposed project. The second step is the determination of overall impact by aggregating the magnitudes of specific impacts in proportion to their respective relative importance, and determining the difference between the aggregated without and with scores. PULSED D.C. MOTOR SPEED CONTROL FOR PORTABLE INSTRUMENTATION,
California Univ., Berkeley.
W. W. Schopp, and H. C. Richardson.
Instruments and Control Systems, Vol 46, No 12, p 45, December 1973. 3 fig.

Descriptors: *Instrumentation, *Monitoring, Pollutant identification.
Identifiers: *Pulsed DC speed control, Motors, Speed control, Controllers.

Many environmental testing instruments require that air be moved at a given rate through a filter for a specific time. This filter is then removed, and the pollutants that have been collected are measured. Most of these instruments use a blower powered by a small DC motor whose speed must be adjustable in order to calibrate the instrument. Many units are designed for portable field use, operate on batteries and use a power consuming series dropping resistor to alter the speed of blower motor. An effective speed control can be implemented by generating a square wave at a constant frequency and varying the duty cycle of the square wave. Additionally, removal of the series resistor increases the motor torque at the slower speed. The design uses a 24-volt DC motor. The pulsed DC speed control is designed around an inexpensive integrated circuit (IC) timing module with a base frequency of 250 kHz. The output pulse train is fed to the base of the Darlington connected transistors. Motor requirements up to 1 A may be handled. A resistor reduces the 24-V motor supply to 12 V for use with the IC, and may be removed if a 12-V supply is available. This control may be used for DC motors with current requirements up to 400 mA. Descriptors: *Remote sensing, *Spectrometers, *Oceanography, Instrumentation, Data processing, Data collections, *Chlorophyll, Pollutant identification.

Identifiers: Radiometry, *Spectroradiometers.

An imaging spectroradiometer (Multichannel Ocean Color Sensor) was designed, developed and flight tested. Computer routines were developed specifically for the program. These included routines to calibrate the data, convert units, plot spectra from specified points in the target area, apply algorithms to identify different types of matter in the water, and generate maps showing variations in the distribution of these algorithm values over the target areas. These maps can be prepared in false color, as density plots, or as contour plots. Data were obtained from both east and west coasts of the United States, the coast of Africa, the Canary Islands, the Gulf Stream, the Bahamas, and the Gulf of Mexico, as well as some freshwater lakes. Differences in chlorophyll concentrations less than 0.1 mg per cu m were readily detected and mapped from an altitude of 11,100 m. (Knapp-USGS)

POTENTIOMETER RECORDERS.
Measurements and Data, Vol 7, No 6, p 62-71, November/December 1973. 2 fig.

Descriptors: *Potentiometers, Resistivity, Specifications, Electronic equipment, Design standards.
Identifiers: *Recorders, Servomotors.

Null-balance recorders are servo-operated devices generally referred to as 'Potentiometers.' The advantages of the null-balance potentiometer are (1) high sensitivity, down to microvolt signals, and (2) independence of lead length. Nearly all process and test variables can be measured in terms of microvolt or millivolt electric signals, and often must be measured at large distance from the point of recording. The potentiometer recorder meets these needs. Further, the potentiometer can be used with minor modifications as a null-balancing bridge-input recorder, which is basically a resistance (or inductance or capacitance) measuring device. A departure from standard servo recorder design is the 'Speed Servo' with a response speed faster than potentiometer recorders which use servomotors, geartrains and cable or cord pen drive. In the 'Speed Servo' strings, pulleys, belts, gears and rotary servomotor are replaced by a servomotor whose armature operates back and forth like a shuttle. This armature features drive coil allowed to slide freely along the pole piece in a magnetic field (produced by the permanent magnet). Current in the drive c coil horizontally. Specifications (channels, FS response, comments, and prices) are given for potentiometers from 69 different suppliers. (Mortland-Battelle)

Descriptors: *Statistical methods, *Probability, Analog models, Algorithms.
Identifiers: *Discrimination information, Probability distribution, Contingency tables.

A generalized procedure is presented of finding the discrete distribution which minimizes, subject to a set of linear constraints on the probabilities, the 'discrimination information' with respect to a given probability distribution. A convergent iterative algorithm is modified to serve this purpose. Many applications are discussed including analyses of contingency tables and some discrete analogues of the one-sample and several-samples problem. A test for the validity of the imposed constraints is provided by a test-statistic distributed asymptotically like a chi sq

BAYESIAN ANALYSIS OF A BIVARIATE NORMAL DISTRIBUTION WITH INCOMPLETE OBSERVATIONS,
Temple Univ., Philadelphia, Pa. Dept. of Mathematics.
J. S. Mehta, and P. A. V. B. Swamy.
Journal of the American Statistical Association, Vol 68, No 344, p 922-927, December 1973. 1 fig, 2 tab, 11 ref.

Descriptors: *Statistical methods, Average, Distribution, Estimating, Equations, Statistical models.
Identifiers: *Bayesian analysis, *Bivariate normal population, Inferences, Data interpretation, Nuisance parameters, Incomplete observations, Difference of means.

A specific problem of making inferences about the difference of the means in a bivariate normal population is considered when the sample has some missing values corresponding to one or both variables. The purpose of the study was to evaluate the effects of extra observations from the populations of x sub 1 and x sub 2 on the overall inferences about the difference of the means. A Bayesian solution to the problem is offered. One advantage of the Bayesian approach is that the nuisance parameters can be eliminated by straightforward integration. The effects of extra observations from the populations of x sub 1 and x sub 2 on the overall inferences about the difference of the means can be evaluated by analyzing the marginal posterior distribution of the difference of the means which incorporates a proper allowance for the roles of the nuisance parameters in the model. MAXIMUM LIKELIHOOD ESTIMATION FOR MIXTURES OF TWO NORMAL DISTRIBUTIONS,
Colorado Univ., Denver. Medical Center.
N. P. Dick, and D. C. Bowden.
Biometrics, Vol 29, No 4, p 781-790, December 1973. 2 fig, 2 tab, 16 ref.

Descriptors: *Distribution patterns, *Probability, *Monte Carlo method, Average, Fisheries, Estimating, Size, Fish.
Identifiers: Variance, Hessian matrix, Normal distribution, Sample size, Maximum likelihood, Data interpretation, Difference of means, Mixtures.

Primary concern is focused on estimation of the parameters mu 1, rho 1 squared, mu 2, rho 2 squared, and p in the mixture of two normal distributions when independent sample information is available from one of the populations. The solution to the maximum likelihood (ML) equations was obtained using Newton's iterative method. Some interesting results for the moment estimates were obtained for the case when independent sample observations are available from one population. Extensive Monte Carlo simulation was employed to obtain the sample variances of the estimates as well as the estimated asymptotic variances. The variances of the estimates are influenced by the separation of the two means with respect to the variances, the mixture proportion (p), and, of course, the size of the sample. When the number of observations is small and the means

are not well separated, the sample variance of the estimates can be as much as three times greater than the estimated asymptotic variances. The problem motivating this research originated in fisheries where it was necessary to estimate the average lengths of the two separate plants of fish after one year, the population variances of the lengths, and the mixture proportion using the entire sample. ADVISORY COMMITTEE ON WATER DATA FOR PUBLIC USE--SUMMARY OF EIGHTH MEETING, JUNE 5-7, 1973, PORTLAND OREGON.
Geological Survey, Washington, D.C. Office of Water Data Coordination.
1973. 45 p, 2 fig.

Descriptors: *Hydrologic data, *Data collections, Planning, Data processing, *Data storage and retrieval, Federal government, Water resources development, *Water quality standards, Baseline studies.
Identifiers: *Willamette River.

Members of the Advisory Committee were in general agreement that the Office of Water Data Coordination had done a good job during the past year of keeping them informed of developments in the resources and environmental information fields. Suggestions made during the general discussion which followed included: that the Geological Survey give serious consideration to establishing a closer working relationship between Federal water-data-collection agencies and those of the States; that consideration be given to holding joint meetings of the Federal Advisory Committee on Water Data and the Advisory Committee on Water Data for Public Use; and that State water-data programs be strengthened, and Federal and State efforts in the area of water-data collection and dissemination be blended into a single national effort. During the discussion the increasing need for environmental baseline data was stressed. A session was devoted entirely to a presentation and discussion of the pilot study, Intensive River-Quality Assessment of the Willamette River. (Knapp-USGS)

Indian Hydrology, Vol 9, No 1, p 38-45, June 1973. 4 fig, 6 ref.

Descriptors: *Data processing, *Geophysics, *Electrical studies, Simulation analysis, Resistivity, Conductivity.

An algorithm is given for the construction of synthetic geoelectric sounding curves. The method presented is simple and fast, and can be operated with slower computers. Given the preliminary results of interpretation of resistivity sounding field data, the synthetic curves may be generated with the help of a digital computer with a prescribed accuracy limit. This serves as a check on the results of preliminary interpretation, and thus forms an integral part of geoelectric data interpretation. (Knapp-USGS)

FOCAL ON THE PDP-9 COMPUTER,
Department of the Environment, Ottawa (Ontario). Inland Waters Directorate.
S. H. Whitlow.
Report Series No 24, 1973. 16 p, 11 ref, append.

Descriptors: *Digital computers, *Computer programs, *Programming languages, *Data processing, Hydrologic data, Canada.

In the Water Science Subdivision of the Canadian Inland Waters Directorate, the PDP-9 computer is used for a variety of scientific calculations. These include analysis of X-ray diffraction, viscosity, density, conductivity, and chromatographic experiments. Often results are needed quickly for calibration purposes or as parameters in subsequent experiments; alternately, mathematical analysis may be used to derive final results and to establish statistical criteria. Much of the data processing is done by means of programs written within the Subdivision and it is anticipated that some of these computer programs of general interest will be described in a future report. This report is designed to be an operating guide for running user programs on the Water Science Subdivision PDP-9 digital computer. It is to permit users with little or no computer background to run simple programs using the FOCAL (FOrmula CALculator or Formulating On-line Calculations in Algebraic Language) conversational language. Operating procedures have been gathered from various sources and are combined with techniques developed through usage to provide step-by-step direction. A new external function, FDRA, is described which adds a straight line display capability to FOCAL. Directions are given to utilize this feature in user programs and an example, 'Least-squares fit with scope display', is provided. (Knapp-USGS)

THE HUMAN ECOLOGICAL IMPACT OF STRUCTURAL FLOOD CONTROL ON THE IOWA RIVER, IOWA,
Iowa Univ., Iowa City. Inst. of Urban and Rural Research.
J. S. Gardner, and N. B. Hultquist.
Available from National Technical Information Service as PB-228 644 $16.50 in paper copy, $1.45 in microfiche. Iowa State Water Resources Research Institute, Iowa State University, Ames, Iowa. Report ISWRRI-58, December 1973. 258 p, 17 fig, 32 tab, 140 ref, append.

Descriptors: Dams, Environment, Floods, *Flood control, Land use, Reservoirs, Iowa, *Social impact, Ecology, *Social change, Recreation, Attitudes, *Environmental effects, *Post-impoundment.
Identifiers: Coralville reservoir(Iowa), *Iowa River(Iowa).

Human ecological impacts of the Coralville Dam and Reservoir, a flood control structure on the Iowa River, Iowa are described. Impacts include agricultural and urban land use changes, recreation participation growth, changes in stream hydrology, erosion, debris and problems associated with prolonged, controlled outflows from the dam and high water levels in the reservoir, and a number of indirect effects of these changes. Development of the project and the changing nature of concerns, conflicts and impacts over time are reviewed. Perceptions of floods and flood control are examined in a sample population along the Iowa River and the results compared with those on the Cedar River, an uncontrolled stream and the Des Moines, a recently controlled stream. Particular attention is directed to the flood of 1973. Prolonged and high outflows from the dam have produced downstream flooding on agricultural land. Resulting conflicts between farmers and the Corps of Engineers over the flood control structure and its operation have lessened its beneficial image at the local level. The research indicates careful attention should be directed to scale of impact, dynamics of impact, zone or location of impact, socio-economic distribution of impact and components of impact, in environmental and human ecological analyses.

EQUIVALENT PIPE METHODS FOR OPTIMIZING WATER NETWORKS--FACTS AND FALLACIES,
Roorkee Univ. (India).
P. K. Swamee, and P. Khanna.
Journal of the Environmental Engineering Division, American Society of Civil Engineers, Vol 100, No EEI, Proceedings paper No 10375, p 93-99, February 1974. 1 fig, 21 equ, 6 ref.

Descriptors: *Economics, *Environmental engineering, *Water distribution(Applied), *Water supply, *Networks, Optimization, *Pipes, Mathematical models, Systems analysis,
Identifiers: Equivalent length approach, Equivalent diameter approach.

A simple water supply loop has been optimized by lag-range-multiplier method. The equivalent length and equivalent diameter approaches for optimizing the same loop, and for water distribution network optimization in general, are critically examined, and the inherent fallacies are considered. The problem of minimizing water network cost reduces essentially to the optimization of a nonlinear objective function subject to nonlinear constraints involving nonanalytical functions. The problem in its original form is unsolvable by known mathematical techniques. Attempts to obtain optimal solution have been either through simplification of the physical problem via certain assumptions, or through the use of objective functions based on equivalent pipe concepts. This paper examines the latter approach to optimization of pipe networks. This approach towards optimization of water networks is based upon knowledge of the pressure surfaces a priori. DEVELOPMENT OF A METER FOR MEASUREMENT OF SEWER FLOW,
Illinois Univ., Urbana. Dept. of Civil Engineering.
H. G. Wenzel, Jr.
Available from National Technical Information Service as PB-228 661 $7.00 in paper copy, $1.45 in microfiche. University of Illinois Water Resources Center Research Report No 74, 1973, 65 p, 25 fig, 4 tab, 20 ref, 2 append. OWRR B-063-ILL(2). 14-31-0001-3581.

Descriptors: *Pipe flow, Instrumentation, *Venturi meters, *Flow measurement, Discharge measurement, Urban drainage, Open channel flow, Design criteria, Performance, Optimization.
Identifiers: *Sewer flow, *Flow meter.

An experimental and analytical study was performed to develop the geometry for a Venturi type flow meter for use in sewer flow measurement. The meter consists of a constriction in the pipe which produces critical flow under open channel flow conditions and acts as a conventional Venturi meter under full flow conditions. The constriction is constructed using cylindrical segments whose diameters are larger than that of the pipe and which are attached to the sides of the pipe, leaving the invert and crown clear. Head loss characteristics and experimental rating curves for both open channel and full flow conditions are described. A procedure is presented, based on experimental data, to theoretically construct a rating curve if experimental calibration is impractical. Information is also presented to permit the selection of geometrical parameters for optimum performance for a specific installation.

EXPERIMENTAL DETERMINATION OF RUN-UP OF UNDULAR AND FULLY DEVELOPED BORES AND AN EXAMINATION OF TRANSITION MODES AND INTERNAL STRUCTURE,
Chicago Univ., Ill. Fluid Dynamics and Sediment Transport Lab.
R. L. Miller.
Available from NTIS as AD-676 312 for $6.00 paper copy, $1.45 microfiche. Technical Report No. 8, prepared for the Office of Naval Research, June 1968. 47 p, 12 fig, 25 ref. Nonr-2121(26).

Descriptors: *Bores, *Waves(Water), *Shallow water, Slopes, Beaches, Aeration.
Identifiers: Long wave theory, Progressive waves, Breaking waves, *Run-up, *Wave run-up.

The run-up of undular surge and bore is determined experimentally, for four slopes each with 3 different bottom roughnesses. The run-up is strongly affected by both slope and bottom roughness. Experimental data on run-up, and changes in structure and celerity of the wave front during progression up slope, disagree in several fundamental aspects with presently published rele-

vant theory based on the non-linear long wave equations. Photographic evidence is presented of two related phenomena in the higher Froude number ranges of the fully developed bore. These are (a) the generation of large eddies which appear to form at the bore face and progress with decreasing diameter toward the rear of the bore, and (b) the associated inclusion of air into the internal portion of the bore (aeration). (Sinha-OEIS)

SELECTION AND DESIGN OF A BORE GENERATOR FOR THE HILO HARBOR TSUNAMI MODEL. HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
C. C. Shen.
Available from NTIS as AD-646 509 for $6.00 paper copy, $1.45 microfiche. Research Report No. 2-5, June 1965. 123 p, 49 fig, 1 tab, 33 ref, 2 append.

Descriptors: *Harbors, Model studies, *Tsunamis, *Bores, *Shallow water, Bays, Coasts, *Hawaii, *Hydraulic models.
Identifiers: Hilo Harbor(Hawaii), Bore generator.

Theoretical and experimental investigations were made of the generation of a bore by the three following types of bore generator: (a) piston type, (b) gate type, and (c) pneumatic type. The analyses were based on nonlinear shallow-water theory incorporated with bore conditions. The experiments were conducted in a test flume 1 ft wide and 40 ft long. Explicit solutions were obtained for the height, duration, and length of bores generated by each type of generator. The bore heights found experimentally agreed very well with the theoretical predictions. A numerical computation of the pneumatic chamber theory was also performed and showed remarkable agreement with test results of the pneumatic-type bore generator. A uniform slope of 3 percent was installed in the test flume to investigate the bore motion over a uniform slope. The bore transformation was found to agree with Whitham's approximate solution. The bore runup reached a height above still-water level 2.6 to 3.0 times greater than the initial height of the bore on the flat bottom. The breaking of the bore during its transformation was also studied. Due to its inexpensiveness and versatility, a pneumatic-type bore generator was recommended for use in the model of Hilo harbor, Hawaii for investigation of tsunami-wave attack at Hilo. (Sinha-OEIS)

EDGE BORES,
Tetra Tech, Inc., Pasadena, Calif.
D. Divoky, and J. Lane.
Final Report No. TT-P-282-73-1, prepared for Office of Naval Research, April 1973. 53 p, 30 fig, 1 tab, 7 ref. N00014-72-C-0366.

Descriptors: *Bays, *Bores, *Harbors, *Beaches, Landslides, *Coastal structures, *Waves(Water), Explosions, *Shore protection.
Identifiers: *Edge bores, Edge waves.

In an experimental test program, the wave height variation along a crest, from deepwater to shore, received primary attention. It was found that under certain conditions the wave height near shore could be as much as five times the offshore height. Such wave amplification is possible at the beach even in the case of zero angle of incidence. Empirical prediction rules were derived. In an edge bore the onshore segment travels at the offshore speed; large lateral flow continually replenishes losses in the edge bore breaking region; the crest is not refracted over the abrupt depth changes. While the offshore segment is limited in height by the offshore depth, the nearshore segment may in fact be of even greater height depending upon beach slope and angle of incidence. The practical importance of the edge bore phenomenon is that shoreline installations can be subjected to waves of very great height when the usual expectation might be only small waves. (Sinha-OEIS)

HURRICANE STUDIES FOR NARRAGANSETT BAY,
Corps of Engineers, Waltham, Mass. New England Div.
J. B. McAleer.
In: Proceedings of Ninth Conference on Coastal Engineering, Lisbon, Portugal, June 1964, American Society of Civil Engineers, Chap 42, p 660-685, 1964. 12 fig, 16 ref.

Descriptors: *Hurricanes, *Shore protection, *Rhode Island, *Coastal engineering, *Surges, Flooding, Coasts, Mathematical models, *Bays, Hydraulic models.
Identifiers: Narragansett Bay(RI).

Hurricane flooding has emerged as one of the major coastal engineering problems of the Atlantic and Gulf Coast areas of the United States. Engineering and scientific investigations have been made to determine the fundamental mechanics of the hurricane surges that cause inundation of coastal areas and to develop practical and economical protection. Mathematical models and large hydraulic models were used for the Narragansett Bay studies of two major projects. The discussions presented are limited to the hydraulic studies of barriers at the mouth of the bay, known as the Lower Bay Barrier Plan, and the Fox Point Hurricane Barrier which is now under construction. ENLARGEMENT OF THE CHESAPEAKE AND DELAWARE CANAL, HYDRAULIC AND MATHEMATICAL MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss. Hydraulics Lab.
M. B. Boyd, W. H. Bobb, C. J. Huval, and T. C. Hill.
Available from NTIS as AD-768 779, $6.25 in paper copy. Technical Report H-73-16, October 1973. 436 p, 18 fig, 4 tab, 22 ref, 243 plates.

Descriptors: *Hydraulic models, *Mathematical models, Delaware River, Chesapeake Bay, *Canals, *Canal construction, Tidal effects, Density currents, Salinity, *Coastal engineering.

Enlargement of the sea-level C and D Canal connecting Chesapeake Bay and Delaware River from 27 by 250 ft to 35 by 450 ft, undertaken in 1954, was essentially complete by 1970 except for about a 2-mile reach at the Delaware River end. Concern about effects of the enlargement on the environmental and biological systems led to the decision to leave the unimproved reach intact, pending completion of extensive environmental studies. This report is concerned with the model studies. The existing Delaware River model was extended to include the 27- by 250-ft C and D Canal and Elk River and the propagation of tides and currents in the addition was verified. Tides, currents, salinities, and discharges were then measured for various head differentials across the canal. The canal was first enlarged to existing conditions (35 by 450 ft, except for the unimproved reach at the Delaware end) and subsequently to project conditions and comparative measurements were made. The critical phenomena affecting flow in the canal is head differential across the canal produced by Chesapeake Bay tides at the western end and Delaware River tides at the eastern end. The canal is a very dynamic system and can experience large differential changes daily. Net flow is toward the lower tide level and enlargement from 27 by 250 ft to August 1972 conditions caused net flow to be increased by a factor of about 4.8 and completion of enlargement will cause additional increases. Dye dispersion tests were made for 27 by 250 ft and completed canal conditions and a mean differential. An existing numerical model based on the one-dimensional unsteady flow equations was used for initial studies concerning net flow changes due on the enlargement. (Sinha - OEIS)

STUDY OF BEACH WIDENING BY THE PERCHED BEACH CONCEPT SANTA MONICA BAY, CALIFORNIA. HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss. Hydraulics Lab.
C. E. Chatham, Jr., D. D. Davidson, and R. W. Whalin.
Available from NTIS as AD-765 433, $4.50 in paper copy. Technical Report H-73-8, June 1973. 131 p, 18 tab, 20 ref, 1 append, 24 photos, 14 plates.

Descriptors: California, *Hydraulic models, *Coastal engineering, Beaches, Rip currents, Sediment transport.
Identifiers: Perched beaches, Freeway locations, Rubble mound structures.

Hydraulic models were studied in determining the technical feasibility and optimum design factors of the perched beach concept for widening the existing beach to provide right-of-way for a freeway along a portion of the Santa Monica Bay coastline. The following parts of the study were completed: (a) An undistorted, three-dimensional, fixed-bed model (scale 1:100) was used to determine the effect of the perched beach on rip currents. If adverse interactions were found to be present, the model was to be used to determine means of minimizing them. (b) A distorted-scale (1:100 horizontal, 1:50 vertical), two-dimensional, movable-bed model was used to estimate the amount of sand which might be lost seaward over the toe structure due to normal and storm wave actions and to determine the optimum crown elevation of the submerged structure and the length of stone riprap apron required to reduce the seaward migration of sand to a minimum. (c) An undistorted, two-dimensional model (scale 1:30) was used to determine the structural design of the proposed rubble-mound toe structure for various depths. (Sinha - OEIS)

THE SKIN EFFECT IN PRODUCING WELLS,
W. Hurst, J. D. Clark, and E. B. Braver.
Journal of Petroleum Technology, Vol 21, No 11, p 1483-1489, November, 1969. 7 fig, 2 tab, 7 ref.

Descriptors: *Flow rates, *Inflow, *Permeability, *Wells, Boreholes, Fluid flow, Laplaces equation, Oil reservoirs, Pressure, Mathematical model.
Identifiers: *Skin effect, Positive skin, Negative skin, Pressure drop, Cumulative production.

The change in permeability in the zone around the wellbore is called the skin effect. If the permeability in the skin zone is less than that of the formation the skin is positive; if greater, the skin is negative. If the two permeabilities are equal, there is no skin. Van Everdingen and Hurst have given mathematical solutions to the case of a zone of reduced permeability around the wellbore by treating the positive skin as a zone of reduced permeability of infinitesimal thickness. In calculating negative skin by this approach mathematical difficulties arise. These can be overcome by assuming an enlarged wellbore radius and using the same equations that apply for positive skin. The cumulative fluid influx into a well was calculated for positive and negative skin values of 0, 2.5, 5, 10, 15, 25, and 50, and for dimensionless time ranging from 100 to 10,000,000. With increase in positive skin the fluid influx is decreased. The larger the absolute value of a negative skin, the greater the apparent wellbore radius and the cumulative fluid influx into the well at any given time. (Gray-NWWA)

INTERPRETATION OF BOUNDARY EFFECTS FROM PUMPING TEST DATA,
Geological Survey, Trenton, N.J. Groundwater Branch.
S. M. Lang.
Journal American Water Works Association, Vol 52, No 3, p 356-364, March, 1960. 6 fig, 2 tab, 6 ref.

Descriptors: *Groundwater, *Wells, *Boundary processes, *Pumping test, Hydraulics, *Hydraulic models, 8theis equation.
Identifiers: Theis nonequilibrium formula, Image well model, Inverted image well model.

The hydraulic characteristics of an aquifer of infinite areal extent and of uniform permeability that define its abilities to store and transmit water are generally determined from the analysis of pumping test data by means of various formulas. The nonequilibrium formula developed by Theis is reviewed. A modification is presented of the Theis formula to extend its application to situations in which the pumped formation is adjacent to another formation of a vastly different transmissibility and the boundary between the formations approximates a straight line. Image and inverted image well models are discussed. (Campbell-NWWA)

WELL COST ANALYSIS,
National Water Well Association, Houston, Tex. Research Facility.
M. D. Campbell.
Water Well Journal, Vol 27, No 6, p 41-44, June 1973.

Descriptors: Wells, *Water wells, Economics, *Cost analysis, Bids, Appraisals, *Construction costs.
Identifiers: *Well cost analysis, Guarantees.

Obtaining a safe and sanitary water supply of adequate quantity to satisfy the owner demands proper well cost analysis. A determination of water needs is a first step, followed by selecting a proper design to assure a sanitary supply. Factors to keep in mind when selecting a contractor are reviewed: reputation of contractor with previous customers, condition and type of equipment he uses, and contractors' design suggestions and guarantees offered. Comparing costs can be more effective by giving attention to the following questions: What capacity is desired; what well-life is desired; what well system efficiency is desired; what quality of well construction and completion will the customer accept. CHART TELLS ANNULAR CIRCULATION PRESSURES,
Continental Oil Co., Houston, Tex.
R. Goldsmith.
The Oil and Gas Journal, Vol 70, No 45, p 66-70, November 6, 1972. 5 fig, 1 tab, 6 ref.

Descriptors: *Laminar flow, *Flow resistance, Hydraulics, *Pressure, *Pumping, Viscous flow, Viscometers, Rheology, Muds, Drilling fluids, Gels.
Identifiers: *Annular circulative pressure, Plastic, Viscosity, Yield point, Initial gel strength, Rheometer.

A graphical method is a convenient means for the calculation of laminar pressure losses of time-independent non-Newtonian fluids in pipes and annuli. This procedure does not require an arbitrary model relating shear stress and shear rate. Measurements commonly made in the field are used. A smooth curve is drawn through the viscometer dial readings at 600 rpm, 300 rpm and the initial gel strength. The circulating pressure at various pumping rates can be read from the graph by referring to the applicable borehole-drill pipe combination. The effective increase in mud weight corresponding to the annular circulating pressure can be read from the chart. Examples are given of the use of the chart. (Gray-NWWA)

DESIGN AND USE OF RADIAL COLLECTOR WELLS,
California State Dept. of Public Health, Santa Rosa. Bureau of Sanitary Engineering.
S. V. Spiridonoff.
Journal American Water Works Association, Vol 56, No 6, p 689-698, June 1964. 4 fig, 1 tab, 13 ref.

Descriptors: *Groundwater, *Wells, *Design, Construction materials, Yield, Caissons.
Identifiers: *Radial collector wells.

Radial collector wells are horizontal perforated conduits that intercept and collect ground water derived principally from surface water infiltration. Such supplies are usually found in the sand and gravel deposits underlying and hydraulically connected with surface sources, such as rivers, lakes, or oceans. Discussed are design details, construction methods, expected yield, limitations, and typical installations of radial collector wells. This type of well enables a large area of an aquifer to be exploited, and the unrestricted access and independent control of each collector pipe permits easy regulation of flow into a caisson and inspection and backwash of the collector pipe. ACQUISITION AND ANALYSIS OF DATA FOR OPTIMIZED DRILLING,
Amoco Production Co., Tulsa, Okla.
J. L. Lummus.
Journal of Petroleum Technology, Vol 23, No 11, p 1285-1293, November 1971. 8 fig, 5 tab, 4 ref.

Descriptors: *Optimization, *Computer programs, *Drilling, *Drill monitors, *Well data, Data processing, Drilling equipment, Drilling fluids, Rotary drilling, Mud, Hydraulics, Cost analysis, Well casings, Blowouts.
Identifiers: 'Op Drilling' program, Drilling variables, Drill bits, Drilling rate.

The first step in preparing an optimized drilling program is to organize the data needed for computer input to calculate optimum values for the controllable drilling factors. The mud program is begun with the selection of the type of drilling fluid as determined by local conditions and experience in the area. The drilling equipment is analyzed to determine if additional mud-handling facilities are needed to maintain a low-solids mud. The hydraulics program is then generated, taking into account the mud, hole size and casing program, drill string and bottomhole assembly, limits of rig horsepower, pump pressure and capacity, and drillability of formations to be penetrated. Selection of the type of bit, rpm and weight on bit may be based on bit records and logs but will be modified as indicated by 'drill off' tests. Blowout control assistance consists of examples for instruction, well control tables and, by telephone, a well-kick model on a time-sharing computer system. As drilling progresses, the program is revised as required by analysis of daily performance and unexpected problems. The most effective method is to have a monitoring unit and computer at the rig. Lacking the computer at the drill site, the summarized information can be transmitted to a central location for analysis by specialists in drilling engineering. Computer-drawn plots permit examination of 23 variables. Usually, however, only six important variables are reviewed in a detailed analysis of the optimized program. (Gray-NWWA)

CONTROLLED SOLUTION MINING IN MASSIVE SALT,
Texas Univ., Austin.
G. F. Sears, and F. W. Jessen.
Society of Petroleum Engineers Journal, Vol 6, No 2, p 115-125, June 1966. 11 fig, 2 tab, 8 ref.

Descriptors: *Storage capacity, *Leaching, *Underground storage, *Mining, Sodium chloride, *Computer programs, *Salts, Storage, Aqueous solutions, Solvent extraction, Pumping.

Identifiers: Massive salt, Salt domes, Solution-control blanket, Storage cavity, Fortran, Dissolution process.

The creation of underground storage cavities for natural gas and liquified gases by dissolving salt involves consideration of the shape of the cavity, the volume of the controlling blanket (oil, gas or air), the rate at which the salt is being removed, the area in the cavity undergoing solution, and the total time required at any point in the development of the planned configuration. The vertical height of the blanket/water interface can be detected by electrical or optical means. The other variables can be related to this independent variable. Equations are given to allow calculation of the total mass removed, the quantity of blanket material necessary to achieve the desired shape, and a computer program is proposed. Results are given for three cavity shapes, showing graphically the total volume removed and the rate of removal of salt as a function of time. A controlled solution mining program for a 100-ft vertical diameter solid conic in massive salt is shown in tabular form. (Gray-NWWA)

NUMERICAL MARCHING TECHNIQUES FOR FLUID FLOWS WITH HEAT TRANSFER,
Carnegie-Mellon Univ., Pittsburgh, Pa.
R. W. Hornbeck.
Available from GPO, Washington, D.C. 20402, Price $3.60, Stock No. 3300-0430. National Aeronautics and Space Administration Report SP-297, 1973. 339 p.

Descriptors: *Heat transfer, *Mixing, *Numerical analysis, *Flow, Open channel flow, Jets, Boundary layers, Convection, Pipe flow, Laminar flow, Equations, Mathematical studies, Mathematical models.
Identifiers: *Marching procedures(Mathematical).

Finite difference formulations and methods of solution are given for a wide variety of fluid flow problems with associated heat transfer. The use of the term marching technique applies to any numerical method of solving an initial value problem. The term is thus applied equally to implicit and explicit techniques for the solution of parabolic and hyperbolic differential equations. Typical problems of this type are those which include any arbitrary distribution of suction or injection at a body surface, body forces such as MHD or EHD forces, any class of variable properties including those in which tabulated property variations must be used, and any type of velocity or temperature boundary condition including convection, jets, variable boundaries, and open channel flow. In the appendixes a number of topics are discussed which are of interest with respect to finite difference equations. These include a very rapid method for solving certain sets of linear algebraic equations, numerical stability, the inherent error in flow rate for confined flow problems, and a method for obtaining high accuracy with a relatively small number of mesh points. METHODS OF REDUCING POWER CONSUMPTION IN PUMPING WATER IN WATER SUPPLY SYSTEMS, INCLUDING THE USE OF BOOSTER STATIONS,
Moskovskii Inzhenerno-Stroitelnyi Institut (USSR).
N. Abramov.
In: Eighth Congress of the International Water Supply Association, September 1-5, 1969, Vienna, Austria, p M3-M20 (1969). 7 fig.

Descriptors: *Water supply, *Pumping, *Pumped storage, *Distribution systems, *Automation, *Electric power, Optimization, Water utilization, Economics, Zoning.
Identifiers: Booster stations, Computer control, Telesignalling, *Moscow water supply system.

It is of great economic importance to find ways of reducing the power consumed in pumping water in urban water mains. There are various ways in which this reduction can be achieved, and they may also contribute significantly to reducing water pumping costs. They include the following: rational selection of number, capacity and location of pumping stations; rational selection of capacity and location of pressure regulating (storage) reservoirs; rational zoning of water supply systems, i.e. subdivision into zones for individual groups of consumers, depending on the geographical relief of the locality and the pressure heads required; control of the operation of individual pumping sets and of pumping stations as a whole when they operate together in a system, in order to achieve optimum conditions that minimize unproductive power consumption; and the use of pipes of relatively low head loss and their maintenance in service. Achieving optimum operating conditions in water supply systems in service is also aided by automatic control of system operation using telesignalling, automatic control and computer control. BOREHOLE SAMPLING OF SATUARATED UNCEMENTED SANDS AND GRAVELS,
Commonwealth Scientific Industrial Research Organization, Syndal (Australia). Div. of Applied Geomechanics.
C. M. Barton.
In: NWWA International Groundwater Symposium on 'Groundwater-the Forgotten Resources', November 20-22, 1973, held at Macquarie University, Sydney, Australia. 14 p, 2 fig, 11 ref.

Descriptors: *Sampling, *Cores, Drilling samples, *Hydrologic data, Soil analysis, Economic feasibility, Aquifer characteristics, Boreholes.
Identifiers: *Borehole sampling, Piston sampler, Open drive sampler, Jet sampler, Extension flap sampler, *In-situ freezing, *Pressure-dewatering, Chemical stabilization.

An outline review of borehole sampling of loose sandy materials for hydrological and water well design purposes is presented. Both standard exploration sampling procedures and more precise special techniques are discussed. A great variety of samplers are described, including open drive samplers; piston samplers (retractable, floating, and fixed); jet samplers; and extension flap samplers. In example circumstances, particularly for uncemented or poorly cemented gravels, it may be necessary to stabilize the strata prior to sampling. Consideration can be given in these cases to in-situ freezing, pressure-dewatering, or chemical stabilization of the strata to produce a truly representative and undisturbed sample. (Hunt-NWWA)

CATHODIC PROTECTION, CONTROL OF EXTERNAL CASING CORROSION,
Shell Oil Co., Midland, Tex.
M. T. Chapman.
Materials Protection and Performance, Vol 12, No 9, p 4-12, September, 1973. 8 fig, 10 ref.

Descriptors: *Wells, *Casing, Corrosion, *Corrosion control, *Cathodic protection, Anode, Cathode, *Texas.
Identifiers: *External corrosion, Rectifiers, Ground beds, Cathodic interference.

External corrosion of well casings, which can cause the loss of a well, has occurred in many areas of the United States. West Texas, a major problem area, has several thousand wells under cathodic protection, the only way to effectively combat external casing corrosion. Amperages needed for protection vary from 1 to as many as 50 amps, and the cost can vary from $3000 to $100,000 or more. Methods for determining the extent of corrosion are discussed, and detailed information on the design and installation of cathodic protection systems is presented. (Staplin-NWWA)

THE INTERPRETATION OF INTERFERENCE TESTS IN NATURALLY FRACTURED RESERVOIRS WITH UNIFORM FRACTURE DISTRIBUTION,
Atlantic Richfield Co., Dallas, Tex.
H. Kazemi, M. S. Seth, and G. W. Thomas.
Society of Petroleum Engineers Journal, Vol 9, No 4, p 463-472, December, 1969. 2 fig, 18 ref.

Descriptors: *Fractures(Geologic), *Oil reservoirs, *Drawdown, *Mathematical models, *Fluid flow, Porosity, Porous media, Pressure, Heterogeneity, Unsteady flow.
Identifiers: Buildup, *Interference tests, Matrix Boundary effects, Warren-Root equations.

Both analytical and numerical solutions are offered to the problem of interpreting interference test results in naturally fractured reservoirs. Analysis is based on the concept of the fractured system as having both matrix porosity and fracture porosity. Radial flow to the wellbore is only through the fracture network and matrix flow is into the fractures. Certain other assumptions are made in arriving at the flow equations. The interference drawdown in an observation well while an adjacent well produced at constant rate was examined for five mathematical models representing a naturally fractured reservoir. The flow equations developed by Warren and Root can be used to interpret interference test data. For early time responses, an equivalent homogeneous model does not adequately depict interference drawdown behavior, but for late time responses results are satisfactory. The effects of well spacing and the magnitude of the interporosity flow parameter are briefly cited. (Gray-NWWA)

CORROSION CONTROL SPEEDS UP,
Clark, Dietz and Associates, Urbana, Ill. Environmental Engineering Section.
P. Clinebell.
Water and Wastes Engineering, Vol 10, No 11, p 42-46, November, 1973.

Descriptors: Corrosion, *Corrosion control, *Cathodic protection, *Sulfur bacteria, Electrochemistry, Hydraulic engineering, *Construction materials, Chemical reactions, Coatings, *Pipelines, Water districts.
Identifiers: Regional water districts, Galvanic corrosion, Pressure fluctuation, Water hammer.

Recently Federal agencies have encouraged the regionalization of potable water supplies number and total length of long distance transmission pipelines for both water and wastewater facilities. This trend emphasizes the need to evaluate fully the material of construction for pipelines to assure protection against corrosion. Other factors related to durability such as soil conditions, terrain, and superimposed loads, should be considered in the design of these essential links to satisfactory service. Metallic pipe because of its chemical nature, is subject to interaction with materials it is transporting or the environment to which it is exposed. This interaction while relatively slow with some pipe materials is more rapid with others and results in deterioration or corrosion of the metallic material. Three commonly recognized types of corrosion are: (1) bacterial or biochemical oxidation; (2) galvanic corrosion or dissimilar metal activity in an electrolyte resulting in dissolution of metals from the exterior of the pipelines; (3) electrolysis or electrolytic corrosion by stray currents generated from external sources. The causes of the different types of corrosion and methods to protect against them are discussed in detail. Also discussed are additional areas that need consideration in the construction of long distribution pipelines. (Hunt-NWWA)
W74-05090

HOW AREAL HETEROGENEITIES AFFECT PULSE-TEST RESULTS,
Esso Production Research Co., Houston, Tex.
S. Vela, and R. M. McKinley.
Society of Petroleum Engineers Journal, Vol 10, No 2, p 181-191, June 1970. 10 fig, 2 tab, 6 ref.

Descriptors: *Transmissivity, *Storage coefficient, *Heterogeneity, *Aquifer characteristics, Porous media, Diffusivity, Permeability, Porosity, Mathematical models, Flow.
Identifiers: *Pulse test, Directional correction, Influence area, *Well pair.

Reservoir transmissibility and storage values can be calculated by inducing pressure pulses in one well and measuring them in a second well. The equations used assume a homogeneous formation. Effects are examined of certain idealized types of areal heterogeneities on the calculated values. An influence area (rectangle) is described for the two wells. Only those heterogeneities within this area significantly affect pulse-test results. The manner in which a pulse test averages heterogeneities within the influence area is described for three limiting cases. These are the cases for which one of the three formation properties (hydraulic diffusivity, transmissibility, and storage) is constant throughout the influence area. A method is developed for the correction of pulse-test values of transmissibility and storage. This 'directional correction' method restores some, if not most, of the true degree of heterogeneity to these values (within the limitations of experimental error and model assumptions). (Gray-NWWA)
W74-05092

LEAK DETECTION,
Compagnie Intercommunale Bruxelloise des Eaux (Belgium).
I. M. Chalet.
In: Eighth Congress of the International Water Supply Association, September 1-5, 1969, Vienna, Austria, p O3-O14, (1969). 12 ref.

Descriptors: *Leakage, *Water loss, *Watertight, Distribution systems, Pipes, Linings.
Identifiers: *Leak detection, Radioactive fluids, Gas dilution.

Leaks in a water distribution system can result in economic losses, decreased abundance of water resources, and the possibility of pollution if pressure falls at the location of a leak. Establishing the existence of leaks includes three possibilities: (1) continuous overall supervision of the network by the Water Authority; (2) incidents coming to light from time to time; and (3) systematic detection campaigns along the network by overall or itinerant methods. Special methods using radioactive fluids, gas dilution, and acoustic and electric-acoustic instruments are described. Other information helpful in discovering leak presence and location includes age of network; depth of pipelines; nature and lining of pipelines; and valves, seals, and cocks used. (Staplin-NWWA)

UNUSUAL CASES OF COPPER CORROSION,
Calgon Corp., Pittsburgh, Pa. Corrosion Research Group.
G. B. Hatch.
Journal American Water Works Association, Vol 53, No 11, p 1417-1428, November 1961. 7 fig, 4 ref.

Descriptors: *Corrosion, *Pitting, *Copper, Aluminum, Iron, Zinc, Oxidation, Chemical reactions.
Identifiers: *Impingement, Cuprous oxide, Carbonized residues.

Copper, like other metals used for potable-water tubing, can be damaged from both general and localized corrosion. A thin, very fine grained film of cuprous oxide normally forms on copper surfaces exposed to potable waters; it is tightly adherent and quite highly protective. The effects of dissolved copper on zinc, iron, and aluminum corrosion are examined. Impingement attack is discussed in some detail, and pitting attack is reviewed for the following systems: cold water lines, hot water lines, domestic service lines, and sprinkler systems. Other causes of pitting, such as carbonized residues, are also discussed. (Campbell-NWWA)

WELLBORE TRANSMISSIBILITY FROM AFTERFLOW-DOMINATED PRESSURE BUILDUP DATA,
Esso Production Research Co., Houston, Tex.
R. M. McKinley.
Journal of Petroleum Technology, Vol 23, No 7, p 863-872, July 1971. 13 fig, 6 ref.

Descriptors: *Permeability, Flow, *Graphical methods, *Transmissivity, Curves, Theis equation, Wells, *Pressure, Drawdown, Groundwater reservoirs.
Identifiers: Buildup, *Skin effect, *Afterflow, Fall-off, Shut-in.

Afterflow -- the continued influx of fluid from a formation into the wellbore after the well is shut in -- may furnish useful information. Pressure measurements should be more accurate during afterflow than later. The pressure change during afterflow should reflect a dynamic balance between (1) the capacity of the well to store fluid, and (2) the ease with which the formation supplies fluid to the wellbore (i.e., an indication of transmissibility). By the use of a set of type-curves prepared for pressure buildup in a homogeneous, radially finite reservoir, near-wellbore transmissibility is calculated directly from pressure buildup data without assuming formation properties. The generation and use of the type curves are described. Examples are given of the use of type curves with wellbores having a skin, a low permeability streak, and partial penetration. Five examples are given of the type-curve analysis of field data that were difficult to interpret conventionally. Although the examples relate to buildup tests, the method is applicable to drawdown, fall-off, and injectivity tests. (Gray-NWWA)

Study of the habitats of young pike-perch Lucioperca lucioperca and roach Rutilus rutilus heckeli, degree of similarity of their food, and relative competition showed the expediency of their combined rearing in the estuarine fish farms of Kuban (USSR). With the combined rearing of the young of these fishes the food base is utilized more completely. The rearing of young pike-perch alone does not noticeably increase the effectiveness of its reproduction, but leads to a decrease of the fish productivity of bodies of water.--Copyright 1973, Biological Abstracts, Inc.

Effect of Organic Insecticides upon Carbon-14 Uptake by Freshwater Phytoplankton,
W74-05211 5C

ABSORPTION CAPACITY (SOILS)
Determination of the Absorption Capacity in Soils, (In Russian),
W74-04947 2G

ABSTRACTS
A Bibliography on Legal and Regulatory Aspects of Water Pollution Control and Abatement, Part I: Abstracts.
W74-05004 5G

A Bibliography on Legal and Regulatory Aspects of Water Pollution Control and Abatement, Part II: Subject Index.
W74-05005 5G

ACETYLENE REDUCTION
Acetylene-Reduction Assay of Anaerobic Nitrogen Fixation by Sediments of Selected Wisconsin Lakes,
W74-05400 5B

ACID MINE WATER
Soil as a Medium for the Renovation of Acid Mine Drainage Water,
W74-04981 5D

Abatement of Mine Drainage Pollution by Underground Precipitation,
W74-05106 5G

Regression Techniques for Estimation of Sulfate in Streams Draining an Area Affected by Coal Mining,
W74-05125 5B

ACID TOXICANTS
Histochemical and Cytophotometric Assay of Acid Stress in Freshwater Fish.
W74-05113 5C

ACIDIC WATER
Histochemical and Cytophotometric Assay of Acid Stress in Freshwater Fish.
W74-05113 5C

ACIDITY GRADIENT
Survival of Brook Trout in a Bog-Derived Acidity Gradient,
W74-04873 5C

ACKER LAKE (MISS
Acker Lake Landslide, Monroe County, Mississippi,
W74-04862 2J

ACTIVATED CARBON
Kraft Pulping Effluent Treatment and Reuse - State of the Art,
W74-05110 5D

ACTIVATED SLUDGE
Dynamic Behavior of a Complete-Mixing Activated Sludge System,
W74-04900 5D

Biological and Nonbiological Processes for Removing Dissolved Organic Substances from Residual Waste Waters (Biologische und nichtbiologische Verfahren zur Entfernung geloester organischer Substanzen aus Restabwaessern),
W74-05262 5D

Purification of Bleached Kraft Mill Effluents by Activated Sludge Treatment (Oczyszczanie metoda osadu czynnego sciekow z produkcji masy celulozowej siarczanowej bielonej),
W74-05267 5D

ADDITIVES
The Role of Paper Mill Additives as Potential Stream Pollutants -- Development of Nuclear Techniques,
W74-05287 5A

ADHESIVES
A Starch-Free Effluent Program for Corrugating Plants,
W74-05250 5B

ADIPOSE TISSUE
Oxychlordane Residues in Human Adipose Tissue,
W74-04872 5A

ADMINISTRATION
AEC Implementation of the National Environmental Policy Act in Its Licensing and Regulation of Nuclear Facilities,
W74-05186 5G

AEOLIAN SOILS
Eolian Origin of Mica in Hawaiian Soils,
W74-05136 2G

AERATED LAGOONS
Biological and Nonbiological Processes for Removing Dissolved Organic Substances from Residual Waste Waters (Biologische und nichtbiologische Verfahren zur Entfernung geloester organischer Substanzen aus Restabwaessern),
W74-05262 5D

Hot Problem Solved by Aerated Lagoon,
W74-05280 5D

AERATION
Dynamic Behavior of a Complete-Mixing Activated Sludge System,
W74-04900 5D

Aeration System Revitalizes Lakes.
W74-05060 5C

Reservoir Aeration Improves Water Quality,
W74-05063 5F

Waste Water Treatment: Using Pure Oxygen for Secondary Treatment,
W74-05247 5D

Purification of Bleached Kraft Mill Effluents by Activated Sludge Treatment (Oczyszczanie metoda osadu czynnego sciekow z produkcji masy celulozowej siarczanowej bielonej),
W74-05267 5D

AERIAL PHOTOGRAPHY
Existing Aerial Photographic Resources of Coastal Georgia and a Brief Listing of Interpretative Aids,
W74-05042 2J

AEROBIC BACTERIA
Identification of Bacteria by Computer: General Aspects and Perspectives,
W74-04909 5A

AEROBIC CONDITIONS
Population Changes in Enteric Bacteria and Other Microorganisms During Aerobic Thermophilic Windrow Composting,
W74-04908 5D

AESTHETICS
Aesthetics in Environmental Planning.
W74-04987 6G

AFRICA
Soil Respiration, Nitrogen Mineralization and Humus Decomposition of East African Soils after Drying and Remoistening (In German),
W74-05054 2G

The Influence of Precipitation and Altitude on the Humus Content of East African Soils (In German),
W74-05058 2G

AFTERFLOW
Wellbore Transmissibility from Afterflow-Dominated Pressure Buildup Data,
W74-05101 8G

AGING (BIOLOGICAL)
Chlorophyll, Nitrogen, and Photsynthetic Patterns During Growth and Senescence of Two Blue-Green Algae,
W74-04884 5C

AGRICULTURAL WATERSHEDS
Atrazine, Propachlor, and Diazinon Residues on Small Agricultural Watersheds,
W74-05295 5B

AGRICULTURE
Agricultural Aspects,
W74-05002 4A

The Summer Fallow System,
W74-05215 3F

Agricultural Aspects of Arid and Semi-Arid Zones,
W74-05216 3F

Possibilities of Supply and Proper use of Water in the Garmsar Area,
W74-05217 3C

General Report on Development and Utilization of Saline Soils in Iran,
W74-05218 3C

Evaluation of the Hydrological Aspects of the Agricultural Studies in Arid and Semi-Arid Zones of Turkey,
W74-05219 3F

The Arid Zone Problems in Turkey,
W74-05225 3F

The Economic Efficiency of Inter-Basin Agricultural Water Transfers in Utah: A Mathematical Programming Approach,
W74-05385 4A

AGRO-INDUSTRIAL PROJECTS
Economic Aspects of a Nuclear Desalination Agro-Industrial Project in the United Arab Republic,
W74-05382 3A

AGROCHEMICAL PROPERTIES
Agrochemical Properties and Forms of Phosphates in Typical Sierozems Irrigated at Various Times, (In Russian),
W74-05377 3F

AIR AQUA SYSTEMS
Aeration System Revitalizes Lakes.
W74-05060 5C

AIR CIRCULATION
20-24 Year Cycle in the March of Atmospheric Precipitation and Its Relation to Air Circulation Patterns (Tsikl 20-24 goda v khode atmosfernykh osadkov i yego svyza' s osobennostyami atmosfernoy tsirkulyatsii),
W74-05149 2B

AIR POLLUTION
Radiological Evaluations for Advanced Waste Management Studies,
W74-05176 5B

Radiological Survey of the Area Surrounding the Elk River Reactor, Elk River, Minnesota.
W74-05179 5B

Environmental Aspects of Natural Gas Stimulation Experiments with Nuclear Devices,
W74-05184 5B

Forest Products Pollution Control -- Annotated Bibliography (Excluding Pulp and Paper),
W74-05284 5B

Energy and the Environment--Electric Power.
W74-05330 5B

AIR POLLUTION EFFECTS
The Nonparasitic Diseases. Immission Damage (Gas, Smoke and Dust Damage). Waste Water Damage Including Damage Caused by Solid Wastes,.
W74-05342 5C

AIR-WATER INTERFACES
On the Calculation of the Roughness Parameter of Sea Ice,
W74-05164 2C

Similarity Constants in the Stratified Planetary Boundary Layer,
W74-05166 2E

ALABAMA
Environmental Geology and Hydrology, Madison County, Alabama: Water Resources,
W74-04911 4B

Prattville, Alabama, Community Development Plan, Volume I: Text.
W74-04991 6B

ALASKA
Water Quality in Alaskan Campgrounds,
W74-04974 5B

North Slope - Construction Criteria for Roads and Facilities,
W74-05104 4A

The Aidjex Lead Experiment,
W74-05158 2C

Gamma-Emitting Radionuclides in Alaskan Environments 1967-1970,
W74-05187 5B

Recent Measurements of Cesium-137 in Residence Time in Alaskan Vegetation,
W74-05188 5B

ALBERNI INLET (BRITISH COLUMBIA)
An Experimental Investigation into Effects of Pulp Mill Effluent on Structure of Biological Communities in Alberni Inlet, British Columbia. Part 1: Subtidal Communities,
W74-05047 5C

ALCOHOLS
Methanol Distribution in an Evaporation Plant,
W74-05253 5D

Spectrophotometric Determination of Low Levels of Mono-, Di-, and Triethylene Glycols in Surface Waters,
W74-05290 5A

ALGAE
Biological Response to Detergent and Nondetergent Phosphorus in Sewage - Part I,
W74-04901 5C

A Bioassay Compromise,
W74-05045 5C

Biomass Monitoring of Algal Cultures by Fluorimetric Measurement of Their Chlorophyll Content,
W74-05055 5C

Relationships Between Phosphorus-32 Accumulation in Algae, Bacteria, and Tubificids,
W74-05206 5C

ALGAE CONTROL
Preliminary Laboratory Tests for the Control of Algae in Rice Fields (In Italian),
W74-05357 5C

ALGAL ASSAY
A Bioassay Compromise,
W74-05045 5C

ALGAL CONTROL
Control of Algae by Mixing,
W74-05064 5G

ALGAL GROWTH
Removal of Nitrogen from Tile Drainage-A Summary Report, Bio-Engineering Aspects of Agricultural Drainage, San Joaquin Valley, California.
W74-05228 5D

ALGICIDES
Preliminary Laboratory Tests for the Control of Algae in Rice Fields (In Italian),
W74-05357 5C

ALGORITHMS
Regional Wastewater Management Systems,
W74-05389 5D

ALKALI METALS
A Review of Water Analysis by Atomic Absorption,
W74-05292 5A

ALKALINE EARTH METALS
A Review of Water Analysis by Atomic Absorption,
W74-05292 5A

ALKYLBENZENE SULFONATES
Treatment of Laundromat Wastes,
W74-05109 5D

ALLUVIUM
Degradation of Parathion by Bacteria Isolated from Flooded Soil,
W74-04889 5B

ALTERNATIVE PLANNING
Econometric Model for River Basin Planning,
W74-04999 4A

Interstate Planning for Regional Water Supply and Pollution Control.
W74-05108 5D

Application of Multigoal Water Quality Planning Model,
W74-05384 5D

Regional Wastewater Management Systems,
W74-05389 5D

Models of Water Supply Systems,
W74-05394 4A

ALUMINUM
Water-Pollution Control in the Primary Nonferrous-Metals Industry -- Volume II. Aluminum, Mercury, Gold, Silver, Molybdenum, and Tungsten,
W74-05117 5D

AMCHITKA ISLAND (ALAS)
Gamma-Emitting Radionuclides in Alaskan Environments 1967-1970,
W74-05187 5B

AMINO ACIDS
Interfacing a Programmable Electronic Calculator with an Automatic Amino Acid Analyzer,
W74-04866 5A

ANABAENA
Characteristics of Phosphorus Deficiency in Anabaena,
W74-04905 5C

Ascorbic Acid and Heterocyst Development in the Blue-Green Alga Anabaena Ambigua,
W74-05052 5C

ANAEROBIC BACTERIA
Recovery and Identification of Anaerobes: A System Suitable for the Routine Clinical Laboratory,
W74-04886 5A

Method for Routine Culturing of Strict Anaerobic Bacteria,
W74-04894 5A

ANALYTICAL TECHNIQUES
Trace Soluable Organic Compounds in Potable Water Supplies,
W74-04855 5A

A Bioassay Compromise,
W74-05045 5C

Biomass Monitoring of Algal Cultures by Fluorimetric Measurement of Their Chlorophyll Content,
W74-05055 5C

New Ultraviolet Ratio Spectrophotometric System for the Determination of Trace Amounts of Phenolic Compounds,
W74-05244 5A

ANIMAL BEHAVIOR
Trophic Relations of Aquatic Insects,
W74-05062 5C

ANIMAL HABITATS
An Evaluation of the Effects of Estuarine Engineering Projects,
W74-05038 5B

ANIONIC SURFACTANTS
Effects of Surfactants on Atomic Absorption Analysis of Dilute Aqueous Copper and Nickel Solutions,
W74-05313 5A

ANNULAR CIRCULATIVE PRESSURE
Chart Tells Annular Circulation Pressures,
W74-05096 8B

ANODIC STRIPPING VOLTAMMETRY
Anodic Stripping Voltammetry of Zinc in Seawater with a Tubular Mercury-Graphite Electrode,
W74-05305 5A

APPALACHIAN MOUNTAIN REGION
The Identification and Quantification of the Net Effects of Multiple-Purpose River Basin Development,
W74-04854 4A

AQUACULTURE
Annotated Bibliography on Effects of Salinity and Salinity Changes on Life in Coastal Waters,
W74-05031 2J

AQUATIC ALGAE
Ultrastructure of the Green Alga Dichotomosiphon tuberosus with Special Reference to the Occurrence of Striated Tubules in the Chloroplast,
W74-04881 5C

The Production of Hydrogen Peroxide by Blue-Green Algae: A Survey,
W74-04882 5C

AQUATIC ANIMALS
Annotated Bibliography on Effects of Salinity and Salinity Changes on Life in Coastal Waters,
W74-05031 2J

AQUATIC ENVIRONMENT
Some Ecological Considerations in Locating a Nuclear-Powered Electrical Generating Facility on the North Anna River, Virginia,
W74-05212 5C

Introduction to Simulation Techniques,
W74-05391 5G

Water Quality Models and Aquatic Ecosystems Status, Problems and Perspectives,
W74-05393 5B

AQUATIC INSECTS
Trophic Relations of Aquatic Insects,
W74-05062 5C

AQUATIC PLANTS
Annotated Bibliography on Effects of Salinity and Salinity Changes on Life in Coastal Waters,
W74-05031 2J

AQUATIC POPULATIONS
Production of a Natural Population of Bithynia Tentaculata L. (Gastropoda, Mollusca),
W74-05049 5C

AQUEDUCTS
California Undersea Aqueduct Reconnaissance: The Oceanography (CUARO),
W74-05040 6B

AQUEOUS SOLUTIONS
Gradient Titration-A Novel Approach to Continuous Monitoring Using ion-selective Electrodes,
W74-05303 2K

Inductively Coupled Plasma-Optical Emission Analytical Spectrometry. A Compact Facility for Trace Analysis of Solutions,
W74-05309 5A

Solvent Extraction of Metal Chelates into Water-Immiscible Acetone,
W74-05311 5A

Effects of Surfactants on Atomic Absorption Analysis of Dilute Aqueous Copper and Nickel Solutions,
W74-05313 5A

Determination of Trace Amounts of C2-C5 Acids in Aqueous Solutions by Gas Chromatography,
W74-05314 5A

AQUIFER CHARACTERISTICS
Ground-Water Resources of the San Antonio Area, Texas: A Progress Report on Studies, 1960-1964,
W74-04992 4B

Pulse-Test Response of a Two-Zone Reservoir,
W74-05077 4B

Groundwater in Papua New Guinea,
W74-05084 4B

How Areal Heterogeneities Affect Pulse-Test Results,
W74-05092 8G

AQUIFERS
Pressure Interference Effects Within Reservoirs and Aquifers,
W74-05087 4B

Groundwater in the Northern Wiso Basin and Environs, Northern Territory,
W74-05331 4B

ARCTIC
North Slope - Construction Criteria for Roads and Facilities,
W74-05104 4A

Classification and Variation of Sea Ice Ridging in the Arctic Basin,
W74-05165 2C

ARCTIC OCEAN
Subsurface Eddies in the Arctic Ocean,
W74-05159 2C

AREA REDEVELOPMENT
The Zuiderzee Works Within the Frame of Physical Planning,
W74-05001 4A

ARGIUDOL
Hydric Regime of an Argiudol (In Spanish),
W74-05324 2G

ARID CLIMATES
Rainfall Intensities in Israel,
W74-05123 2B

Vegetation of Central Anatolia and its Ecology,
W74-05214 4A

ARID LANDS
Vegetation of Central Anatolia and its Ecology,
W74-05214 4A

The Summer Fallow System,
W74-05215 3F

Agricultural Aspects of Arid and Semi-Arid Zones,
W74-05216 3F

Evaluation of the Hydrological Aspects of the Agricultural Studies in Arid and Semi-Arid Zones of Turkey,
W74-05219 3F

Erosion Control and Vegetative Cover Under Dryland Conditions in Turkey,
W74-05220 3F

Wheat Production Problems and Potentials on Drylands,
W74-05221 3F

Systems Analysis: A Decision-making Tool for Arid Land Development,
W74-05223 6A

Improving Farm Production in Regions of Limited Rainfall,
W74-05224 3F

ARIZONA
Water-Resources Appraisal of the Big Sandy Area, Mohave County, Arizona,
W74-04922 4B

An Analysis of the Water Quality Problems of the Safford Valley, Arizona,
W74-04976 5B

Invasion of Semidesert Grassland by Velvet Mesquite and Associated Vegetation Changes,
W74-05226 3F

Santa Rita Experimental Range: Your Facility for Research on Semidesert Ecosystems,
W74-05227 3F

AROMATIC AMINES
Analysis of Primary Aromatic Amines and Nitrite by Diazotization and Pyrolysis Gas Chromatography,
W74-05315 5A

AROMATIC COMPOUNDS
Identification of Aromatic Nitriles by Reaction Paper Chromatography,
W74-04865 5A

Analysis of Primary Aromatic Amines and Nitrite by Diazotization and Pyrolysis Gas Chromatography,
W74-05315 5A

ARTESIAN AQUIFERS
Predictive Simulation of the Subsidence of Venice,
W74-05137 2F

ARTIFICIAL SUBSTRATES
Settling Plates of Cold-Cure Acrylic Plastic Replicated from Natural Surfaces,
W74-05319 5A

ASCORBIC ACID
Ascorbic Acid and Heterocyst Development in the Blue-Green Alga Anabaena Ambigua,
W74-05052 5C

ASPEN INVASION
The Relationship of Soil Temperature and Cytokinin Production in Aspen Invasion,
W74-04978 2I

ASSAY
Characteristics of Phosphorus Deficiency in Anabaena,
W74-04905 5C

Low-Level Radioactivity Measurements,
W74-05178 5A

Gamma-Emitting Radionuclides in Alaskan Environments 1967-1970,
W74-05187 5B

Strontium-90 and Cesium-137 in Water and Deep Sediments of the Great Lakes,
W74-05208 5C

Microcultures of Brown Bullhead (Ictalurus nebulosus) Cells: Their Use in Quantitation of Channel Catfish (Ictalurus punctatus) Virus and Antibody,
W74-05323 5A

Acetylene-Reduction Assay of Anaerobic Nitrogen Fixation by Sediments of Selected Wisconsin Lakes,
W74-05400 5B

ATLANTIC SALMON
Ultimate Upper Lethal Temperature of Atlantic Salmon Salmo salar L.,
W74-04869 5C

ATMOSPHERIC PRESSURE
Effect of Wave Action on Tidal Stages Along the Coast of Florida, March 1962,
W74-04927 2L

ATOMIC ABSORPTION SPECTROPHOTOMETRY
The Determination of Cobalt in Fish Tissue by Atomic Absorption Spectrophotometry,
W74-05399 5A

ATTITUDES
Aesthetics in Environmental Planning.
W74-04987 6G

AUSTRALIA
Comparative Characteristics of Desert Soils of USSR and Australia, (In Russian),
W74-04998 2G

Chemical Aspects of Underground Water,
W74-05080 4B

Groundwater in the Northern Wiso Basin and Environs, Northern Territory,
W74-05331 4B

AUTOMATION
Methods of Reducing Power Consumption in Pumping Water in Water Supply Systems, Including the Use of Booster Stations,
W74-05093 8C

Gradient Titration-A Novel Approach to Continuous Monitoring Using ion-selective Electrodes,
W74-05303 2K

AXENIC CULTURES
The Production of Hydrogen Peroxide by Blue-Green Algae: A Survey,
W74-04882 5C

BACILLUS
Degradation of Parathion by Bacteria Isolated from Flooded Soil,
W74-04889 5B

BACKGROUND RADIATION
Environmental Monitoring. Annual Report, 1972, (Atomics International),
W74-05177 5B

BACTERIA
Method for Radiorespirometric Detection of Bacteria in Pure Culture and in Blood,
W74-04887 5A

Estimating the Density of Individual Bacterial Populations Introduced into Natural Ecosystems,
W74-04890 5A

The Effect of Thyroxine and Triiodothyronine on Bacterial Growth,
W74-04891 5A

Effect of Helium Gas at Elevated Pressure on Iron Transport and Growth of Escherichia coli,
W74-04897 5C

Spatial Differentiation Abundance of Bacteria in the Water of Mikolajskie Lake,
W74-05051 5C

Changes of Some Chemical Constituents and Bacterial Numbers in Slapy Reservoir During Eight Years,
W74-05070 5C

The Influence of Two Re-Regulation Reservoirs on the Chemical and Bacteriological Properties of River Water,
W74-05074 5C

Relationships Between Phosphorus-32 Accumulation in Algae, Bacteria, and Tubificids,
W74-05206 5C

Direct Counts and Plate Counts of Bacteria in the Danube between Berg Spring and Ulm (In German),
W74-05362 5A

BACTERIAL COLONIES
Scanning Electron Microscopy of Bacterial Colonies,
W74-04885 5A

BACTERIAL DENITRIFICATION
Removal of Nitrogen from Tile Drainage-A Summary Report, Bio-Engineering Aspects of Agricultural Drainage, San Joaquin Valley, California.
W74-05228 5D

BACTERICIDAL AGENTS
Comparative Study of the Effect of Some Anion Active Detergents on the Reproduction of Listeria monocytogenes and Other Bacteria,
W74-05360 5C

BACTERIOLOGY
Physioecology of the Umsindusi River within the Pietermaritzburg City Limits,
W74-05363 5B

BALTIC SEA REGION
Effect of Hydrometeorological Conditions on Time of Ice Formation on Rivers in the Baltic Sea Region and Belorussia (Vliyaniye gidrometeorologicheskikh uslovity na sroki poyavleniya l'da na rekakh Pribaltiki i Belorussii),
W74-05143 2C

BARK
Altitudinal Variation of Chlorophyll Concentration and Reflectance of the Bark of Populus tremuloides,
W74-04977 2I

BARRIER BEACHES
Rhode Island's Barrier Beaches: Volume I, a Report on a Management Problem and an Evaluation of Options,
W74-05152 2L

BARRIER ISLANDS
Rhode Island's Barrier Beaches: Volume II. Reports and Recommendations at the Community Level,
W74-05033 2J

Rhode Island's Barrier Beaches: Volume I, a Report on a Management Problem and an Evaluation of Options,
W74-05152 2L

BAYESIAN ANALYSIS
Bayesian Analysis of a Bivariate Normal Distribution with Incomplete Observations,
W74-04893 7C

BAYS
Edge Bores,
W74-04948 8B

Quasi-Weekly and Daily Profile Changes on a Distinctive Sand Beach,

BIOCHEMICAL OXYGEN DEMAND
Treatment of Laundromat Wastes,
W74-05109 5D

The Oxygen Uptake Demand of Resuspended Bottom Sediments.
W74-05114 5C

Methanol Distribution in an Evaporation Plant,
W74-05253 5D

'Barovibra' BOD Measuring Apparatus (Barovibra-BSB-Messgeraet),
W74-05265 5A

BIOCHEMISTRY
Factors Affecting the Photosynthetic Capacity of Laboratory Cultures of the Diatom Phaeodactylum Tricornutum,
W74-05046 5C

Bioenergetics of the Assimilating Cells of Chlorella Pyrenoidosa Chick. II. Relation of Cyclic and Non-Cyclic Photophosphorylation to Photosynthetic CO2 Fixation,
W74-05059 5C

BIODEGRADATION
Microbial Degradation of Petroleum in Continental Shelf Sediments,
W74-05153 5B

BIOENERGETICS
Species of Oceanic Dinoflagellates in the Genera Dissodinium and Pyrocystis: Interclonal and Interspecific Comparisons of the Color and Photon Yield of Bioluminescence,
W74-04883 5B

BIOLOGICAL COMMUNITIES
An Experimental Investigation into Effects of Pulp Mill Effluent on Structure of Biological Communities in Alberni Inlet, British Columbia. Part 1: Subtidal Communities,
W74-05047 5C

Limnological Survey of Lakes Michigan, Superior, Huron and Erie,
W74-05067 5C

Hydrobiological Studies 2.
W74-05068 5C

BIOLOGICAL PROPERTIES
Isolation and Characterization of a Thermotolerant Methanol-Utilizing Yeast,
W74-04907 5A

Limnological Survey of Lakes Michigan, Superior, Huron and Erie,
W74-05067 5C

BIOLOGICAL SAMPLES
Determination of Eight Metals in the International Biological Standard by Flameless Atomic-Absorption Spectrometry,
W74-04868 5A

BIOLOGICAL TREATMENT
Dynamic Behavior of a Complete-Mixing Activated Sludge System,
W74-04900 5D

Ecology of Daphnia in Stabilization Ponds,
W74-05048 5D

Air Flotation-Biological Oxidation of Synthetic Rubber and Latex Waste-Water,
W74-05105 5D

Survey of Residual Waste Water Treatment (Ueberblick ueber die Behandlung der Restabwaesser),
W74-05261 5D

Biological and Nonbiological Processes for Removing Dissolved Organic Substances from Residual Waste Waters (Biologische und nichtbiologische Verfahren zur Entfernung geloester organischer Substanzen aus Restabwaessern),
W74-05262 5D

Purification of Bleached Kraft Mill Effluents by Activated Sludge Treatment (Oczyszczanie metoda osadu czynnego sciekow z produkcji masy celulozowej siarczanowej bielonej),
W74-05267 5D

BIOLOGY
Annotated Bibliography on Effects of Salinity and Salinity Changes on Life in Coastal Waters,
W74-05031 2J

BIOLUMINESCENCE
Species of Oceanic Dinoflagellates in the Genera Dissodinium and Pyrocystis: Interclonal and Interspecific Comparisons of the Color and Photon Yield of Bioluminescence,
W74-04883 5B

BIOMASS
Primary Production of the Periphyton in the Littoral of the Danube,
W74-04876 5C

Production of a Natural Population of Bithynia Tentaculata L. (Gastropoda, Mollusca),
W74-05049 5C

Spatial Variability of the Productivity: Biomass Ratio for Phytoplankton in a Small Marine Basin,
W74-05316 5C

BIONOMICS
Bionomics of Cyclops strenuus abyssorm Sars (Copepoda:Cyclopoida),
W74-05344 5C

BIOSYNTHESIS
Urease Activity of Enterobacteriaceae: Which Medium to Choose,
W74-04888 5A

BIOTA
Water Quality Models and Aquatic Ecosystems Status, Problems and Perspectives,
W74-05393 5B

BITHYNIA TENTACULATA
Production of a Natural Population of Bithynia Tentaculata L. (Gastropoda, Mollusca),
W74-05049 5C

BIVARIATE NORMAL POPULATION
Bayesian Analysis of a Bivariate Normal Distribution with Incomplete Observations,
W74-04893 7C

BLACKGUM SEEDLINGS
Accumulation of Ce-144 by Hickory and Co-60 by Black Gum Seedlings,
W74-05196 5B

BLEACHING WASTES
The Purification of Residual Waste Waters of the Sulfite Pulp Industry (Die Reinigung von Restabwaessern der Sulfitzellstoff-Industrie),
W74-05260 5D

Purification of Bleached Kraft Mill Effluents by Activated Sludge Treatment (Oczyszczanie metoda osadu czynnego sciekow z produkcji masy celulozowej siarczanowej bielonej),
W74-05267 5D

Combined Mill Effluent Goes to Aeration Pond in PE (Polyethylene) Pipeline.
W74-05269 5D

Isolation and Chemical Identification of Toxic Components of Kraft Mill Wastes,
W74-05270 5A

Effluent-Free Bleached Kraft Pulp Mill: Present State of Development,
W74-05275 5D

BLOOD
Method for Radiorespirometric Detection of Bacteria in Pure Culture and in Blood,
W74-04887 5A

BODY FLUIDS
The Quantitative Determination of Chromium in Urine by Flameless Atomic Absorption Spectroscopy,
W74-05291 5A

BOGS
Photosynthetic Rates in Relation to Nitrogen Recycling as an Adaptation to Nutrient Deficiency in Peat Bog Plants,
W74-05065 5C

BOREHOLE GEOPHYSICS
Borehole Geophysics as Applied to Groundwater,
W74-05118 4B

BOREHOLE SAMPLING
Borehole Sampling of Satuarated Uncemented Sands and Gravels,
W74-05081 8G

BORES
Experimental Determination of Run-up of Undular and Fully Developed Bores and an Examination of Transition Modes and Internal Structure,
W74-04936 8B

Selection and Design of a Bore Generator for the Hilo Harbor Tsunami Model. Hydraulic Model Investigation,
W74-04946 8B

Edge Bores,
W74-04948 8B

BORON
Effect of Trace Elements on the Water Regimen, the Decorative Qualities and the Seed Yield of Some Ornamental Plants, (In Russian),
W74-05345 5C

BOTTOM FRICTION
Longshore Currents Generated by Obliquely Incident Sea Waves,
W74-04943 2E

BOTTOM SEDIMENTS
Basic Patterns in the Distribution of Chemical Elements in Deep-Sea Sediments of the Black Sea (Osnovnyye zakonomernosti raspredeleniya khimicheskikh elementov v tolshche glubokovodnykh osadkov Chernogo morya),
W74-05023 5B

The Oxygen Uptake Demand of Resuspended Bottom Sediments.
W74-05114 5C

Phosphates in Sediments of Pamlico Estuary,
W74-05296 5A

BOUNDARY LAYERS
Similarity Constants in the Stratified Planetary Boundary Layer,
W74-05166 2E

BOUNDARY PROCESSES
Interpretation of Boundary Effects from Pumping Test Data,
W74-05089 8B

BRANCH-AND-BOUND STRATEGY
Regional Wastewater Management Systems,
W74-05389 5D

BREAKERS
Longshore Currents at Nags Head, North Carolina,
W74-04928 2L

BREAKING WAVES
The Internal Velocity Field in Breaking Waves,
W74-04960 2J

Wave Energy and Littoral Transport,
W74-04965 2J

BREEDING
Breeding and Growth of the Chaetognath Sagitta Elegans in Bedford Basin,
W74-05317 5C

BROADKILL RIVER (DEL)
The Hydrography of the Broadkill River Estuary, Delaware,
W74-05122 2L

BROOK TROUT
Survival of Brook Trout in a Bog-Derived Acidity Gradient,
W74-04873 5C

Histochemical and Cytophotometric Assay of Acid Stress in Freshwater Fish.
W74-05113 5C

BROOME COUNTY (NEW YORK)
Development of Water Facilities--Broome County, 1967-2017.
W74-05232 6B

Sewerage Feasibility Study, Broome County, New York, Summary, Conclusions and Recommendations.
W74-05233 5D

Riverbanks Improvement Program,
W74-05234 6F

BULGARIA
Density of Growth and Level of Fertilization as Influencing the Water Consumption of Maize, (In Bulgarian),
W74-05339 3F

BYPRODUCTS
Slow Releasing Nitrogen Fertilizer from the Waste Product, Lignin Sulphonates,
W74-05249 5B

Removal of Residual Waste Water Sludges (Beseitigung der Restabwasserschlaemme),
W74-05263 5D

CADMIUM
A Technique for Extraction and Storage of Water Samples for Mn, Cd, and Pb Determination by Atomic Absorption Spectroscopy,
W74-05293 5A

CALCIUM
Calcium Cycling: Diffusion into a Forest Soil,
W74-05200 5B

CALCIUM CARBONATE
Reuse of Solid Waste from Water-Softening Processes,
W74-05127 5D

The Possibility of Soda Formation in Soil by Biochemical Means, (In Russian),
W74-05271 2G

CALCIUM ELECTRODES
Investigation of the Factors Affecting the Response Time of a Calcium Selective Liquid Membrane Electrode,
W74-05304 2K

CALCIUM SULFATE
The Possibility of Soda Formation in Soil by Biochemical Means, (In Russian),
W74-05271 2G

CALIFORNIA
Report on the Composition of Oil from the Region of New Hydrocarbon Upwelling in the Santa Barbara Channel,
W74-04919 5A

Quasi-Weekly and Daily Profile Changes on a Distinctive Sand Beach,
W74-04964 2L

Sand Losses from a Coast by Wind Action,
W74-04967 2J

Geothermal Resource Investigations, Imperial Valley, California: Special Report Test Well Mesa 6-1.
W74-05139 4B

Nutrients from Tile Drainage Systems, Bio-Engineering Aspects of Agricultural Drainage, San Joaquin Valley, California.
W74-05229 5B

CALIFORNIA CENTRAL VALLEY PROJECT
Optimal State Analysis of Reservoirs,
W74-05167 6A

CAMALLANUS-LACUSTRIS
On the Problem of Host Specificity, Reservoir Parasitism and Secondary Invasions of Camallanus lacustris (Nematoda:Camallanidae), (In Czech),
W74-05359 5C

CAMPGROUNDS
Water Quality in Alaskan Campgrounds,
W74-04974 5B

CAMPING
Water Quality in Alaskan Campgrounds,
W74-04974 5B

CANADA
Ultimate Upper Lethal Temperature of Atlantic Salmon Salmo salar L.,
W74-04869 5C

On the Position of Tidal Barriers in Northumberland Strait,
W74-05140 2E

A Starch-Free Effluent Program for Corrugating Plants,
W74-05250 5B

PCB Residues in Plankton from the Gulf of St. Lawrence,
W74-05256 5A

How Much Will Cleanup Cost,
W74-05268 5D

Pollution -- Yesterday, Today, and Tomorrow,
W74-05272 5D

Inventory of Spray Irrigation Systems in the Great Lakes Basin of Canada.
W74-05288 5D

Spatial Variability of the Productivity: Biomass Ratio for Phytoplankton in a Small Marine Basin,
W74-05316 5C

Breeding and Growth of the Chaetognath Sagitta Elegans in Bedford Basin,
W74-05317 5C

CANADA (PERCH LAKE)
The Fate of Cobalt-60 in a Natural Freshwater Ecosystem,
W74-05203 5C

CANAL CONSTRUCTION
Enlargement of the Chesapeake and Delaware Canal, Hydraulic and Mathematical Model Investigation,
W74-05036 8B

CANALS
Enlargement of the Chesapeake and Delaware Canal, Hydraulic and Mathematical Model Investigation,
W74-05036 8B

An Economic Appraisal of Changes in Water Use Through Investments in Navigable Rivers and Canals,
W74-05395 6A

CANNERIES
Composition and Waste Load of Unit Effluents from a Commercial Leafy Greens Canning Operation,
W74-04904 5A

CANOPY DRIP
Investigations on the Transfer of Bioelements from Organic Matter to Soil Solution in the Humus Layer of a Beech Stand (In German),
W74-05367 2G

CAPE COD (MASS)
Residence Time of Sand Composing the Beaches and Bars of Outer Cape Cod,
W74-04968 2J

CAPITAL COSTS
Area-Wide Water and Sewerage System Plan and Capital Improvement Program.
W74-05242 5D

CAPITAL IMPROVEMENT PROGRAM
Area-Wide Water and Sewerage System Plan and Capital Improvement Program.
W74-05242 5D

CARBOHYDRATES
A Starch-Free Effluent Program for Corrugating Plants,
W74-05250 5B

Spectrophotometric Determination of Low Levels of Mono-, Di-, and Triethylene Glycols in Surface Waters,
W74-05290 5A

CARBON
The Influence of Precipitation and Altitude on the Humus Content of East African Soils (In German),
W74-05058 2G

CARBON RADIOISOTOPES
Effect of Organic Insecticides upon Carbon-14 Uptake by Freshwater Phytoplankton,
W74-05211 5C

CARBONATE ROCKS
Characteristics of Organic-Matter Distribution in Calcareous Sediments of the Caspian Sea and in Mesozoic Carbonate Rocks of the Southeastern Caucasus (Osobennosti raspredeleniya organicheskogo veshchestva v izvestkovykh osadkakh Kaspiyskogo morya i karbonatnykh porodakh mezozoya yugovostochnogo Kavkaza),
W74-05021 5B

Retention Basin Failures in Carbonate Terranes,
W74-05337 5B

CARBONATE SOILS
Determination of the Absorption Capacity in Soils, (In Russian),
W74-04947 2G

CARIES
Influence of Water Intake on the Degree of Incisor Fluorosis and on the Incorporation of Fluoride into Bones and Incisor Teeth of Mice,
W74-05246 5C

CARP
Cycling of Zinc-65 in a Simple Food Web,
W74-05202 5C

Contribution to the General Pathology of Endocardial Reactions: Toxic Endocardial Lesions in Lower Vertebrates (Carp), (In German),
W74-05308 5C

Distribution and Epizootiological Importance of Dactylogyrus extensus (Monogenoidea) in Slovakia (In Czech),
W74-05358 5C

CASING
Cathodic Protection, Control of External Casing Corrosion,
W74-05085 8G

CASPIAN SEA
Characteristics of Organic-Matter Distribution in Calcareous Sediments of the Caspian Sea and in Mesozoic Carbonate Rocks of the Southeastern Caucasus (Osobennosti raspredeleniya organicheskogo veshchestva v izvestkovykh osadkakh Kaspiyskogo morya i karbonatnykh porodakh mezozoya yugovostochnogo Kavkaza),
W74-05021 5B

CATHODIC PROTECTION
Cathodic Protection, Control of External Casing Corrosion,
W74-05085 8G

Corrosion Control Speeds Up,
W74-05090 8G

CAUSEWAYS
On the Position of Tidal Barriers in Northumberland Strait,
W74-05140 2E

CELLULOSE
Selective Chromatographic Separation of Uranium(VI) on Deae-Cellulose Layers in Dilute Acetic Acid Media,
W74-04864 5A

Wood Waste Reuse in Controlled Release Pesticides,
W74-05286 5D

CENTRAL U
Water and the Energy Crisis,
W74-04912 6D

CENTRAL UTAH PROJECT
The Economic Efficiency of Inter-Basin Agricultural Water Transfers in Utah: A Mathematical Programming Approach,
W74-05385 4A

CEREAL CROPS
Influence of Water Regime on the Indirect Absorption of Radiocesium, Radiostrontium, and Radiocobalt by Lowland Rice,
W74-05199 5B

CESIUM
Recent Measurements of Cesium-137 in Residence Time in Alaskan Vegetation,
W74-05188 5B

Radionuclide Biomagnification in Coastal-Plain Deer,
W74-05189 5B

Cesium-137 in White-Tailed Deer as Related to Vegetation and Soils of the Southeastern United States,
W74-05190 5B

Distribution of Cesium-137 in a Small Watershed in Northern Mississippi,
W74-05191 5B

A Proposed Mechanism for the Recycling of Radiocesium in Florida Soil Plant Systems,
W74-05192 5A

Cesium-137 Soil Inventory of a Tagged Liriodendron Forest 1962 and 1969,
W74-05193 5B

Persistence of Radionuclides in Soil, Plants, and Small Mammals in Areas Contaminated with Radioactive Fallout,
W74-05194 5B

Cycling of Stable Cesium in a Desert Ecoystem,
W74-05195 5B

Accumulation of Ce-144 by Hickory and Co-60 by Black Gum Seedlings,
W74-05196 5B

Influence of Water Regime on the Indirect Absorption of Radiocesium, Radiostrontium, and Radiocobalt by Lowland Rice,
W74-05199 5B

Ecological Factors Affecting the Accumulation of Cesium-137 Fallout by a Natural Population of Largemouth Bass, (Micropterus Salmoides),
W74-05204 5C

Strontium-90 and Cesium-137 in Water and Deep Sediments of the Great Lakes,
W74-05208 5C

CHANNEL CATFISH VIRUS
Microcultures of Brown Bullhead (Ictalurus nebulosus) Cells: Their Use in Quantitation of Channel Catfish (Ictalurus punctatus) Virus and Antibody,
W74-05323 5A

CHANNEL EROSION
Experimental Study of River Incision,
W74-05134 2J

CHARA
Thermal Effects on Biological Production in a Pond,
W74-04861 5C

The Characeae of Southeastern United States,
W74-04879 5A

CHEMICAL ANALYSIS
Interfacing a Programmable Electronic Calculator with an Automatic Amino Acid Analyzer,
W74-04866 5A

Voltammetric Behaviour of Copper(III) and Its Analytical Applications,
W74-04870 5A

The Quantitative Determination of Chromium in Urine by Flameless Atomic Absorption Spectroscopy,
W74-05291 5A

A Review of Water Analysis by Atomic Absorption,
W74-05292 5A

The Determination of Cobalt in Fish Tissue by Atomic Absorption Spectrophotometry,
W74-05399 5A

CHEMICAL LOSS
Preservation of Dilute Mercury Solutions,
W74-05310 5A

CHEMICAL OXYGEN DEMAND
Treatment of Laundromat Wastes,
W74-05109 5D

CHEMICAL PRECIPITATION
Experiences with Chemical Pre-Purification of Kraft Mill Waste Water with Magnesium Chloride Brine (Potassium Extraction Liquor) (Erfahrungen bei der chemischen Vorreinigung von Sulfatzellstoffabwasser mit Magnesiumchloridsole (Kaliendlauge),
W74-05283 5D

CHEMICAL PROPERTIES
Hydrobiological Studies 2.
W74-05068 5C

Changes of Some Chemical Constituents and Bacterial Numbers in Slapy Reservoir During Eight Years,
W74-05070 5C

The Influence of Two Re-Regulation Reservoirs on the Chemical and Bacteriological Properties of River Water,
W74-05074 5C

CHEMICAL REACTIONS
Confirmation of Hexachlorobenzene by Chemical Reaction,
W74-04871 5A

CHEMISTRY OF PRECIPITATION
Chemical Composition of Monsoon Rainwater Over Chandigarh in 1971,
W74-05130 2B

CHINOOK SALMON
Hood Canal Pond Revision,
W74-05157 8I

CHLAMYDOMONAS
Synchronous Cultures of Chlamydomonas Reinhardti: Properties and Regulation of Repressible Phosphatases,
W74-05053 5C

CHLORELLA
Bioenergetics of the Assimilating Cells of Chlorella Pyrenoidosa Chick. II. Relation of Cyclic and Non-Cyclic Photophosphorylation to Photosynthetic CO2 Fixation,
W74-05059 5C

CHLORINATED HYDROCARBON PESTICIDES
Atrazine, Propachlor, and Diazinon Residues on Small Agricultural Watersheds,
W74-05295 5B

Esterification of (2,4-Dichlorophenoxy)Acetic Acid - A Quantitative Comparison of Esterification Techniques,
W74-05312 5A

CHLOROPHYLL
Primary Production of the Periphyton in th Littoral of the Danube,
W74-04876 5C

Chlorophyll, Nitrogen, and Photsynthetic Pat terns During Growth and Senescence of Tw Blue-Green Algae,
W74-04884 5C

Altitudinal Variation of Chlorophyll Concentra tion and Reflectance of the Bark of Populu tremuloides,
W74-04977 2

Development and Flight Test of the Multichan nel Ocean Color Sensor (MOCS),
W74-05026 7I

CHLOROPHYTA
The Characeae of Southeastern United States,
W74-04879 5A

Ultrastructure of the Green Alg Dichotomosiphon tuberosus with Specia Reference to the Occurrence of Striated Tu bules in the Chloroplast,
W74-04881 5C

CHOREOCOLAX POLYSIPHONIAE
The Ultrastructure of an Alloparasitic Red Alg Choreocolax Polysiphoniae,
W74-05299 5C

CHRISTINA RIVER BASIN (DELAWARE)
Water Resources as a Basis for Comprehensive Planning and Development in the Christina River Basin,
W74-04988 6B

CHROMATOGRAPHY
Identification of Aromatic Nitriles by Reaction Paper Chromatography,
W74-04865 5A

Characterization of Wood-Preserving Coal-Tar Creosote by Gas-Liquid Chromatography,
W74-05306 5A

Use of Multiple R Sub F Values for Identification by Paper and Thin-Layer Chromatography,
W74-05307 5A

CHROMIUM
The Quantitative Determination of Chromium in Urine by Flameless Atomic Absorption Spectroscopy,
W74-05291 5A

CIRCULATION
Coastal Circulation Near Kakinada Bay During Monsoon Period,
W74-04941 2L

A Study on Mixing and Circulation in the St. Lawrence Estuary Up to 1964,
W74-04944 2L

CITIES
Observing Fire Protection Requirements in Future Water System Design,

Identification of Bacteria by Computer: General Aspects and Perspectives,
W74-04909 5A

Identification of Bacteria by Computer: Identification of Reference Strains,
W74-04910 5A

Acquisition and Analysis of Data for Optimized Drilling,
W74-05099 8B

Controlled Solution Mining in Massive Salt,
W74-05103 8B

Focal on the PDP-9 Computer,
W74-05151 7C

Regional Environmental Pollution Study: Inventory and Analysis.
W74-05239 5B

Modeling of Wastewater Disposal Systems,
W74-05388 5D

Mathematical Model for Oxygen Balance in Rivers,
W74-05392 5B

CONDENSATION
Methanol Distribution in an Evaporation Plant,
W74-05253 5D

CONDUCTIVITY
Soil as a Medium for the Renovation of Acid Mine Drainage Water,
W74-04981 5D

CONFERENCES
Geothermal Energy, A National Proposal for Geothermal Resources Research.
W74-04917 2F

CONJUNCTIVE USE
Systematic Design of Legal Regulations for Optimal Surface-Groundwater Usage--Phase 1,
W74-04853 4B

Groundwater Resources of the Vale of Clwyd.
W74-05168 4B

CONNECTICUT
A Summary Report on the Study of Land and Water Resources in Northeast Greenwich, Connecticut.
W74-04996 4D

CONSERVATION
A Summary Report on the Study of Land and Water Resources in Northeast Greenwich, Connecticut.
W74-04996 4D

CONSTRUCTION
Proceedings of Fourth Sanitary Engineering Conference on Water Distribution Systems.
W74-05006 5F

Water Main Laying,
W74-05010 5F

Tapping, Disinfection, and Inspection of Water Mains,
W74-05011 5F

CONSTRUCTION COSTS
Comparative Costs of Erosion and Sediment Control, Construction Activities.
W74-04986 4D

Well Cost Analysis,
W74-05091 8B

CONSTRUCTION MATERIALS
Corrosion Control Speeds Up,
W74-05090 8G

Combined Mill Effluent Goes to Aeration Pond in PE (Polyethylene) Pipeline.
W74-05269 5D

CONTENTIAL SHELF
Microbial Degradation of Petroleum in Continental Shelf Sediments,
W74-05153 5B

CONTINENTAL SHELF
Ocean Dumping in the New York Bight: An Assessment of Environmental Studies,
W74-04863 5C

CONTINENTAL SLOPE
Sedimentary Processes on the Continental Slope Off New England,
W74-05043 2J

CONTINUOUS MONITORING
Gradient Titration-A Novel Approach to Continuous Monitoring Using ion-selective Electrodes,
W74-05303 2K

COOLING TOWERS
Hot Problem Solved by Aerated Lagoon,
W74-05280 5D

COOSCILLATING TIDES
Tidal Dynamics in Estuaries. Part I: Estuaries of Rectangular Section,
W74-04952 2L

Tidal Dynamics in Estuaries. Part II: Rea Estuaries,
W74-04953 2L

COPEPOD
Philometra nodulosa in Wyoming White Suckers,
W74-05329 5C

COPEPODA
Bionomics of Cyclops strenuus abyssorm Sar (Copepoda:Cyclopoida),
W74-05344 5C

COPEPODS
Redescription of Mappates plataxus Rangneka (Copepoda: Caligidae),
W74-04877 2

COPPER
Voltammetric Behaviour of Copper(III) and It Analytical Applications,
W74-04870 5A

Unusual Cases of Copper Corrosion,
W74-05097 8C

Water-Pollution Control in the Primary Nonfer rous-Metals Industry -- Volume I. Copper Zinc, and Lead Industries,
W74-05116 5I

Effects of Surfactants on Atomic Absorptio Analysis of Dilute Aqueous Copper and Nicke Solutions,
W74-05313 5A

CORE DRILLING
An Investigation of Core Drilling in Perennially Frozen Gravels and Rock,
W74-05170 2C

CORES
Borehole Sampling of Satuarated Uncemente Sands and Gravels,
W74-05081 8C

CORN (FIELD)
Density of Growth and Level of Fertilization a Influencing the Water Consumption of Maize (In Bulgarian),
W74-05339 3F

CORP
Changes in Morphological Composition of th Blood of Larval Fish Bitten by Water Bug Fam. Corixidae), (In Russian),
W74-05209 5C

CORROSION
Proceedings of Fourth Sanitary Engineering Conference on Water Distribution Systems.
W74-05006 5F

Unusual Cases of Copper Corrosion,
W74-05097 8C

Effects of Waste Water Recycle in a Paper board Mill,
W74-05254 5D

CORROSION CONTROL
Cathodic Protection, Control of External Cas ing Corrosion,
W74-05085 8G

Corrosion Control Speeds Up,
W74-05090 8G

Selection, Handling, and Protection of Downhole Materials: A Practical Approach,
W74-05102 8G

CORXIDAE
Changes in Morphological Composition of the Blood of Larval Fish Bitten by Water Bugs Fam. Corixidae), (In Russian),
W74-05209 5C

COST ANALYSIS
Well Cost Analysis,
W74-05091 8B

A Mathematical Model for Optimizing the Design of Reverse Osmosis Systems,
W74-05276 5D

COST BENEFIT ANALYSIS
The Identification and Quantification of the Net Effects of Multiple-Purpose River Basin Development,
W74-04854 4A

Economic Aspects of a Nuclear Desalination Agro-Industrial Project in the United Arab Republic,
W74-05382 3A

An Economic Appraisal of Changes in Water Use Through Investments in Navigable Rivers and Canals,
W74-05395 6A

COST MINIMIZATION
Application of Multigoal Water Quality Planning Model,
W74-05384 5D

Models of Water Supply Systems,
W74-05394 4A

COSTS
How Much Will Cleanup Cost,
W74-05268 5D

A Regional Planning Model for Water Quality Control,
W74-05390 5B

COTTON
Cotton: A Computer Simulation of Cotton Growth,
W74-05213 3F

COTTON DISEASES
In Vitro Interactions of Fusarium and Verticillium Wilt Fungi with Water, pH and Temperature,
W74-05341 3F

COTTONWOODS
Altitudinal Variation of Chlorophyll Concentration and Reflectance of the Bark of Populus tremuloides,
W74-04977 2I

The Relationship of Soil Temperature and Cytokinin Production in Aspen Invasion,
W74-04978 2I

COULOMETRIC TITRATION
Coulometric Determination of Iron(II)-1,10-Phenanthroline with Cerium(IV),
W74-04867 5A

CRABS
Taxonomy, Distribution and Ecology of the Genus Sesarma (Crustacea, Decapoda, Grapsidae) in Eastern North America, with Special Reference to Florida,
W74-04880 2I

CREOSOTE
Characterization of Wood-Preserving Coal-Tar Creosote by Gas-Liquid Chromatography,
W74-05306 5A

CROPS
Effect of Crops and their Predecessors on the Aggregate Composition of Meadow Sierozem Soils, (In Russian),
W74-05374 3F

CRYOLOGY
The Effect of Impurities on the Mechanical Properties of Ice Single Crystals,
W74-04914 2C

Theory of Metamorphism of Wet Snow,
W74-05154 2C

CRYSTAL GROWTH
Theory of Metamorphism of Wet Snow,
W74-05154 2C

CULTURE MEDIA
Urease Activity of Enterobacteriaceae: Which Medium to Choose,
W74-04888 5A

An Appraisal of Identification Methods for Penicillium Species: Novel Taxonomic Criteria Based on Temperature and Water Relations,
W74-04902 5A

Improved pH Control of Fungal Culture Media,
W74-04903 5A

Multipurpose Medium for Use with Pseudomonas Species,
W74-04906 5A

CULTURES
Method for Radiorespirometric Detection of Bacteria in Pure Culture and in Blood,
W74-04887 5A

Estimating the Density of Individual Bacterial Populations Introduced into Natural Ecosystems,
W74-04890 5A

Method for Routine Culturing of Strict Anaerobic Bacteria,
W74-04894 5A

An Appraisal of Identification Methods for Penicillium Species: Novel Taxonomic Criteria Based on Temperature and Water Relations,
W74-04902 5A

CULTURING TECHNIQUES
Recovery and Identification of Anaerobes: A System Suitable for the Routine Clinical Laboratory,
W74-04886 5A

CURRENTS (WATER)
Currents Around the Hawaiian Islands. A Study of Coastal Currents in Respect to Sewage Disposal,
W74-04925 5B

CERC Bulletin and Summary Report of Research Progress for Fiscal Years 1965-66.
W74-04926 2L

Longshore Currents at Nags Head, North Carolina,
W74-04928 2L

Some Modern Approaches to Beach Studies,
W74-04930 2J

Littoral Processes - Quantitative Treatment,10B. Le Mehaute.
W74-04931 2J

Nearshore Processes,
W74-04932 2L

Coastal Circulation Near Kakinada Bay During Monsoon Period,
W74-04941 2L

Estuary and Coastline Hydrodynamics.
W74-04950 2L

Field Experience in Estuaries,
W74-04956 2L

Quantitative Research on Littoral Drift in Field and Laboratory,
W74-04966 2J

Longshore Currents and Sediment Motion in the Coastal Zone of the Sea of Azov,
W74-05024 2L

Movement of Water Along the Shore and Normal to it in the Near-Shore Zone of a Shallow-Water Coast,
W74-05028 2L

Composite Energy Fluxes as Factors in Coastal Formation,
W74-05029 2L

Similarity Constants in the Stratified Planetary Boundary Layer,
W74-05166 2E

CUTTINGS
Microclimatic Conditions on the Cutover Areas of Shelterwood Cuttings, (In Russian),
W74-05349 2I

CYANOPHYCEAE
Study of Metabolic Regulations Between Cyanophyceae and Fish (In Russian),
W74-05327 5C

CYANOPHYTA
The Production of Hydrogen Peroxide by Blue-Green Algae: A Survey,
W74-04882 5C

Chlorophyll, Nitrogen, and Photsynthetic Patterns During Growth and Senescence of Two Blue-Green Algae,
W74-04884 5C

CYCLES
20-24 Year Cycle in the March of Atmospheric Precipitation and Its Relation to Air Circulation Patterns (Tsikl 20-24 goda v khode atmosfernykh osadkov i yego svyza' s osobennostyami atmosfernoy tsirkulyatsii),
W74-05149 2B

CYCLING
Cycling of Stable Cesium in a Desert Ecoystem,
W74-05195 5B

CYCLING NUTRIENTS
Nutrient Studies in Hyperfertilized Estuarine Ecosystems. I. Phosphorus Studies,
W74-05061 5C

Photosynthetic Rates in Relation to Nitrogen Recycling as an Adaptation to Nutrient Deficiency in Peat Bog Plants,
W74-05065 5C

Calcium Cycling: Diffusion into a Forest Soil,
W74-05200 5B

CYPRINID
On the Problem of Host Specificity, Reservoir Parasitism and Secondary Invasions of Camallanus lacustris (Nematoda:Camallanidae), (In Czech),
W74-05359 5C

CYTOKININ
The Relationship of Soil Temperature and Cytokinin Production in Aspen Invasion,
W74-04978 2I

CYTOLOGICAL STUDIES
Ultrastructure of the Green Alga Dichotomosiphon tuberosus with Special Reference to the Occurrence of Striated Tubules in the Chloroplast,
W74-04881 5C

Scanning Electron Microscopy of Bacterial Colonies,
W74-04885 5A

Characteristics of Phosphorus Deficiency in Anabaena,
W74-04905 5C

Isolation and Characterization of a Thermotolerant Methanol-Utilizing Yeast,
W74-04907 5A

Ascorbic Acid and Heterocyst Development in the Blue-Green Alga Anabaena Ambigua,
W74-05052 5C

Synchronous Cultures of Chlamydomonas Reinhardti: Properties and Regulation of Repressible Phosphatases,
W74-05053 5C

Microcultures of Brown Bullhead (Ictalurus nebulosus) Cells: Their Use in Quantitation of Channel Catfish (Ictalurus punctatus) Virus and Antibody,
W74-05323 5A

CZECHOSLOVAKIA
Efficacy of Large Doses of Mineral Fertilizers in Irrigated Soils, (In Russian),
W74-05379 3F

CZECHOSLOVAKIA (SLOVAKIA)
Distribution and Epizootiological Importance of Dactylogyrus extensus (Monogenoidea) in Slovakia (In Czech),
W74-05358 5C

DACTYLOGYRUS-EXTENSUS
Distribution and Epizootiological Importance of Dactylogyrus extensus (Monogenoidea) in Slovakia (In Czech),
W74-05358 5C

DANUBE RIVER
Primary Production of the Periphyton in the Littoral of the Danube,
W74-04876 5C

DAPHNIA
Ecology of Daphnia in Stabilization Ponds,
W74-05048 5D

Daphnia Distribution Within Langmuir Circulations,
W74-05318 5C

DAPHNIA SIMILIS
Ecology of Daphnia in Stabilization Ponds,
W74-05048 5D

DATA COLLECTIONS
Advisory Committee on Water Data for Public Use--Summary of Eighth Meeting, June 5-7, 1973, Portland Oregon.
W74-04924 7C

Flood Stages and Discharges for Small Streams in Texas,
W74-05107 2E

Borehole Geophysics as Applied to Groundwater,
W74-05118 4B

Evaluation of Ground-Water Data,
W74-05119 4B

Collection of Groundwater Data,
W74-05120 4B

Pan and Lake Evaporation in Pennsylvania,
W74-05121 2D

DATA INTERPRETATION
Interfacing a Programmable Electronic Calculator with an Automatic Amino Acid Analyzer,
W74-04866 5A

DATA PROCESSING
Interfacing a Programmable Electronic Calculator with an Automatic Amino Acid Analyzer,
W74-04866 5A

On the Automatic Computation of Geoelectric Sounding Curves,
W74-05129 7C

Focal on the PDP-9 Computer,
W74-05151 7C

Minicomputers' Role in Monitoring,
W74-05297 5A

DATA STORAGE AND RETRIEVAL
Advisory Committee on Water Data for Public Use--Summary of Eighth Meeting, June 5-7, 1973, Portland Oregon.
W74-04924 7C

Regional Environmental Pollution Study: Inventory and Analysis.
W74-05239 5B

DECISION MAKING
Systems Analysis: A Decision-making Tool for Arid Land Development,
W74-05223 6A

DEER
Radionuclide Biomagnification in Coastal-Plain Deer,
W74-05189 5B

Cesium-137 in White-Tailed Deer as Related to Vegetation and Soils of the Southeastern United States,
W74-05190 5B

DEFICIENT ELEMENTS
Characteristics of Phosphorus Deficiency in Anabaena,
W74-04905 5C

DEFORMATION
A Relation Between the Potential Energy Produced by Ridging and the Mechanical Work Required to Deform Pack Ice,
W74-05160 2C

Redistribution Functions and Their Yield Surfaces in a Plastic Theory of Pack Ice Deformation,
W74-05161 2C

Dimensionless Strength Parameters for Floating Ice Sheets,
W74-05162 2C

A Mechanical Model of Rafting,
W74-05163 2C

Classification and Variation of Sea Ice Ridging in the Arctic Basin,
W74-05165 2C

DELAWARE
Water Resources as a Basis for Comprehensive Planning and Development in the Christina River Basin,
W74-04988 6B

The Hydrography of the Broadkill River Estuary, Delaware,
W74-05122 2L

DELAWARE RIVER (TOCK'S ISLAND REGION)
Interstate Planning for Regional Water Supply and Pollution Control.
W74-05108 5D

DELTAS
The Coastline of River-Deltas,
W74-04961 2L

DENSITY
Clustering in Supercooled Water,
W74-05251 1A

DENSITY STRATIFICATION
On the Measurement of Turbulence in Estuaries,
W74-04933 5B

DENVER (COLO)
Storm of May 5-6, 1973, in the Denver Metro Area: Frequency and Effect,
W74-05171 2E

DEPOSITION (SEDIMENTS)
Longshore Currents and Sediment Motion in the Coastal Zone of the Sea of Azov,
W74-05024 2L

DEPTH-AREA CURVES
Rainfall Intensities in Israel,
W74-05123 2B

DEPTH-AREA-DURATION ANALYSIS
Rainfall Intensities in Israel,
W74-05123 2B

DESALINATION
Economic Aspects of a Nuclear Desalination Agro-Industrial Project in the United Arab Republic,
W74-05382 3A

DESERT PLANTS
Santa Rita Experimental Range: Your Facility for Research on Semidesert Ecosystems,
W74-05227 3F

DESERT SOILS
Comparative Characteristics of Desert Soils of USSR and Australia, (In Russian),
W74-04998 2C

DESERTS
Cycling of Stable Cesium in a Desert Ecosystem,
W74-05195 5B

Santa Rita Experimental Range: Your Facility for Research on Semidesert Ecosystems,
W74-05227 3F

DESIGN
Proceedings of Fourth Sanitary Engineering Conference on Water Distribution Systems.
W74-05006 5F

Applications of System Analyzers: A Summary,
W74-05008 5F

Pipe Materials, Coatings, and Joints for Water Distribution Systems,
W74-05009 5F

Design and Use of Radial Collector Wells,
W74-05098 8B

Models of Water Supply Systems,
W74-05394 4A

DESTRATIFICATION
Control of Algae by Mixing,
W74-05064 5G

DETERGENTS
Biological Response to Detergent and Nondetergent Phosphorus in Sewage - Part I,
W74-04901 5C

DETERGENTS (ANION ACTIVE)
Comparative Study of the Effect of Some Anion Active Detergents on the Reproduction of Listeria monocytogenes and Other Bacteria,
W74-05360 5C

DETRITUS
Preparation of Filtered Plankton and Detritus for Study with Scanning Electron Microscopy,
W74-05320 5A

DEWATERING
Reuse of Solid Waste from Water-Softening Processes,
W74-05127 5D

Removal of Residual Waste Water Sludges (Beseitigung der Restabwasserschlaemme),
W74-05263 5D

DIATOMS
Factors Affecting the Photosynthetic Capacity of Laboratory Cultures of the Diatom Phaeodactylum Tricornutum,
W74-05046 5C

Preparation of Filtered Plankton and Detritus for Study with Scanning Electron Microscopy,
W74-05320 5A

DIAZOTIZATION
Analysis of Primary Aromatic Amines and Nitrite by Diazotization and Pyrolysis Gas Chromatography,
W74-05315 5A

DIBBLING
Effect of Dibbling of Winter Fallow on Hydrophysical Properties of Frozen Soil and on Erosion Processes (Vliyaniye lunkovaniya zyabi na vodno-fizicheskiye svoystva merzloy pochvy i protsessy erozii),
W74-05019 2G

DICHOTOMOSIPHON TUBEROSUS
Ultrastructure of the Green Alga Dichotomosiphon tuberosus with Special Reference to the Occurrence of Striated Tubules in the Chloroplast,
W74-04881 5C

DIFFUSION
On the Measurement of Turbulence in Estuaries,
W74-04933 5B

Near-Surface Oceanic Diffusion from a Continuous Point Source,
W74-04937 2L

Diffusion Experiments in Coastal Waters Using Dye Techniques,
W74-04938 2L

Sedimentation in Estuaries,
W74-04955 2L

Model Laws for Coastal and Estuarine Models,
W74-04957 2L

Application of Boundary-Layer Theory to Dispersion in Nonstratified Two-Dimensional Estuaries,
W74-04983 2L

DIFFUSIVITY
Pressure Interference Effects Within Reservoirs and Aquifers,
W74-05087 4B

DIGITAL COMPUTERS
Focal on the PDP-9 Computer,
W74-05151 7C

Minicomputers' Role in Monitoring,
W74-05297 5A

DIKES
Numerical Prediction on Typhoon Tide in Tokyo Bay,
W74-04971 2L

Recreation in the Open Air,
W74-05003 6B

Research to Determine the Environmental Response to the Deposition of Spoil on Salt Marshes Using Diked, and Undiked Techniques--First Annual Progress Report,
W74-05075 5C

DINOFLAGELLATES
Species of Oceanic Dinoflagellates in the Genera Dissodinium and Pyrocystis: Interclonal and Interspecific Comparisons of the Color and Photon Yield of Bioluminescence,
W74-04883 5B

DIPTERA
Bottom Fauna of Golcuk Lake. 1. Population Study of Chironomids, Chaoborus and Oligochaeta,
W74-05044 5C

DISASTER FORECASTING
Studies on Reclamation Dike at River Mouth: Method of Forecasting Disaster Occurrence at Land Reclamation by Means of Estimating Influence of Shape of Dike and Configuration Surrounding Land Reclamation Area (In Japanese),
W74-05355 4A

DISCHARGE (WATER)
Workbook of Thermal Plume Prediction: Volume 1, Submerged Discharge,
W74-05111 5B

Large Rivers of the United States.,
W74-05138 2E

DISCRIMINATION INFORMATION
Approximating Discrete Distributions, with Applications,
W74-04892 7C

DISINFECTION
Tapping, Disinfection, and Inspection of Water Mains,
W74-05011 5F

DISPERSION
Application of Boundary-Layer Theory to Dispersion in Nonstratified Two-Dimensional Estuaries,
W74-04983 2L

Numerical and Analytical Solutions of Dispersion in a Finite, Adsorbing Porous Medium,
W74-05334 5B

DISSOLVED OXYGEN
Dissolved Oxygen and Iron in Shallow Wells at Salisbury, Md.,
W74-05078 5B

A Regional Planning Model for Water Quality Control,
W74-05390 5B

DISSOLVED SOLIDS
Computer Simulation of the Hydrologic and Salinity Flow Systems Within the Bear River Basin,
W74-04860 5B

Migration of Elements in River Waters (Migratsiya elementov v rechnykh vodakh),
W74-05022 5B

Possible Cause of Formation of Horizontal Hydrogeochemical Zonality of Groundwater in Central Kazakhstan (O vozmozhnoy prichine vozniknoveniya gorizontal'noy gidrogeokhimicheskoy zonal'nosti podzemnykh vod v Tsentral'nom Kazakhstane),
W74-05147 2F

Experiences with Chemical Pre-Purification of Kraft Mill Waste Water with Magnesium Chloride Brine (Potassium Extraction Liquor) (Erfahrungen bei der chemischen Vorreinigung von Sulfatzellstoffabwasser mit Magnesiumchloridsole (Kaliendlauge),
W74-05283 5D

DISTRIBUTION PATTERNS
Tidal Stream Development and Its Effect on the Distribution of the American Oyster,
W74-04878 5C

Maximum Likelihood Estimation for Mixtures of Two Normal Distributions,
W74-04898 7C

Basic Patterns in the Distribution of Chemical Elements in Deep-Sea Sediments of the Black Sea (Osnovnyye zakonomernosti raspredeleniya khimicheskikh elementov v tolshche glubokovodnykh osadkov Chernogo morya),
W74-05023 5B

Workbook of Thermal Plume Prediction: Volume 1, Submerged Discharge,
W74-05111 5B

Daphnia Distribution Within Langmuir Circulations,
W74-05318 5C

Model for Coliform Bacteria in Grand Traverse Bay,
W74-05328 5B

DISTRIBUTION SYSTEMS
Proceedings of Fourth Sanitary Engineering Conference on Water Distribution Systems.
W74-05006 5F

Methods of Reducing Power Consumption in Pumping Water in Water Supply Systems, Including the Use of Booster Stations,
W74-05093 8C

DOMESTIC WASTES
Physioecology of the Umsindusi River within the Pietermaritzburg City Limits,
W74-05363 5B

DOWNHOLE MATERIALS
Selection, Handling, and Protection of Downhole Materials: A Practical Approach,
W74-05102 8G

DRAINAGE PRACTICES
Experiment in Rapid Leaching of Saline Soils in the Golodnaya Steppe (Opyt uskorennoy promyvki zasolennykh pochv Golodnoy stepi),
W74-05018 3C

DRAINAGE PROGRAMS
Prattville, Alabama, Community Development Plan, Volume I: Text.
W74-04991 6B

DRAINAGE SYSTEMS
The Application of Binary Tree Structures to Hydrologic Network Simulators,
W74-04852 4A

DRAINS
Experiment in Rapid Leaching of Saline Soils in the Golodnaya Steppe (Opyt uskorennoy promyvki zasolennykh pochv Golodnoy stepi),
W74-05018 3C

DRAWDOWN
The Interpretation of Interference Tests in Naturally Fractured Reservoirs with Uniform Fracture Distribution,
W74-05086 8G

DREDGING
Research to Determine the Environmental Response to the Deposition of Spoil on Salt Marshes Using Diked, and Undiked Techniques--First Annual Progress Report,
W74-05075 5C

Research to Determine the Environmental Response to the Deposition of Spoil on Salt Marshes Using Diked and Undiked Techniques--First Annual Progress Report,
W74-05332 5C

DRIFT CURRENT
Diffusion Experiments in Coastal Waters Using Dye Techniques,
W74-04938 2L

DRILL MONITORS
Acquisition and Analysis of Data for Optimized Drilling,
W74-05099 8B

DRILLING
Acquisition and Analysis of Data for Optimized Drilling,
W74-05099 8B

DRUG RESISTANCE
Drug Resistance of Coliform Bacteria in Hospital and City Sewage,
W74-05361 5B

DRY FARMING
The Summer Fallow System,
W74-05215 3F

Agricultural Aspects of Arid and Semi-Arid Zones,
W74-05216 3F

Possibilities of Supply and Proper use of Water in the Garmsar Area,
W74-05217 3C

General Report on Development and Utilization of Saline Soils in Iran,
W74-05218 3C

Wheat Production Problems and Potentials on Drylands,
W74-05221 3F

Improving Farm Production in Regions of Limited Rainfall,
W74-05224 3F

The Arid Zone Problems in Turkey,
W74-05225 3F

DRYING
Removal of Residual Waste Water Sludges (Beseitigung der Restabwasserschlaemme),
W74-05263 5D

DUNES
Sand Losses from a Coast by Wind Action,
W74-04967 2J

DYSTROPHY
The Fate of Cobalt-60 in a Natural Freshwater Ecosystem,
W74-05203 5C

E
Effect of Helium Gas at Elevated Pressure on Iron Transport and Growth of Escherichia coli,
W74-04897 5C

ECOLOGICAL DISTRIBUTION
Taxonomy, Distribution and Ecology of the Genus Sesarma (Crustacea, Decapoda, Grapsidae) in Eastern North America, with Special Reference to Florida,
W74-04880 2I

Tritium Movement in an Old-Field Ecosystem Determined Experimentally,
W74-05198 5B

ECOLOGY
Some Aspects of the Role of Usnic Acid in Forest Ecology,
W74-04979 5B

Annotated Bibliography on Effects of Salinity and Salinity Changes on Life in Coastal Waters,
W74-05031 2J

An Ecological Approach to the Evaluation of Radioactivity Within the Man-Environment Ecosystem,
W74-05182 5B

Ecological Factors Affecting the Accumulation of Cesium-137 Fallout by a Natural Population of Largemouth Bass, (Micropterus Salmoides),
W74-05204 5C

ECONOMETRICS
Econometric Model for River Basin Planning,
W74-04999 4A

ECONOMIC ANALYSIS
An Economic Appraisal of Changes in Water Use Through Investments in Navigable Rivers and Canals,
W74-05395 6A

ECONOMIC EFFICIENCY
Hot Problem Solved by Aerated Lagoon,
W74-05280 5D

The Economic Efficiency of Inter-Basin Agricultural Water Transfers in Utah: A Mathematical Programming Approach,
W74-05385 4A

ECONOMIC FEASIBILITY
The Identification and Quantification of the Net Effects of Multiple-Purpose River Basin Development,
W74-04854 4A

Fundamental View of the Closed Water Circuit (Der geschlossene Wasserkreislauf in grundsaetzlicher Betrachtung),
W74-05282 5D

ECONOMIC IMPACT
Economic, Social and Environmental Impacts of Public Works, Vol. I Pittsburgh Area Studies, Vol. II. The Alegheny County Sanitary Authority (AlCoSan) Facility, Vol. III. Impact Analysis,
W74-05231 6B

Sewage Collection and Treatment Systems: Issues in and Approaches to Impact Analysis,
W74-05241 6B

How Much Will Cleanup Cost,
W74-05268 5D

Economic Impact of Pollution Abatement on the Sulfite Segment of the U.S. Pulp and Paper Industry,
W74-05277 5D

Measuring Impacts of Water Resource Developments on the Human Environment,
W74-05338 6G

ECONOMICS
Equivalent Pipe Methods for Optimizing Water Networks--Facts and Fallacies,
W74-05383 8A

ECOSYSTEM
Cycling of Stable Cesium in a Desert Ecoystem,
W74-05195 5B

The Fate of Cobalt-60 in a Natural Freshwater Ecosystem,
W74-05203 5C

ECOSYSTEMS
An Analysis of Mercurials in the Elephant Butte Ecosystem,
W74-04859 5B

Radionuclides in Ecosystems, Volume I.
W74-05181 5B

An Ecological Approach to the Evaluation of Radioactivity Within the Man-Environment Ecosystem,
W74-05182 5B

A Proposed Mechanism for the Recycling of Radiocesium in Florida Soil Plant Systems,
W74-05192 5A

Tritium Movement in an Old-Field Ecosystem Determined Experimentally,
W74-05198 5B

Some Ecological Considerations in Locating a Nuclear-Powered Electrical Generating Facility on the North Anna River, Virginia,
W74-05212 5C

EDDIES
Composite Energy Fluxes as Factors in Coastal Formation,
W74-05029 2L

Subsurface Eddies in the Arctic Ocean,
W74-05159 2C

EDDY VISCOSITY
Diffusion Experiments in Coastal Waters Using Dye Techniques,
W74-04938 2L

EDGE BORES
Edge Bores,
W74-04948 8B

EDWARDS AQUIFER (TEX
Ground-Water Resources of the San Antonio Area, Texas: A Progress Report on Studies, 1960-1964,
W74-04992 4B

EFFLUENTS
Composition and Waste Load of Unit Effluents from a Commercial Leafy Greens Canning Operation,
W74-04904 5A

ELECTRIC POWER
An Evaluation of the Effects of Estuarine Engineering Projects,
W74-05038 5B

Methods of Reducing Power Consumption in Pumping Water in Water Supply Systems, Including the Use of Booster Stations,
W74-05093 8C

ELECTRIC POWERPLANTS
Energy and the Environment--Electric Power.
W74-05330 5B

ELECTRICAL STUDIES
On the Automatic Computation of Geoelectric Sounding Curves,
W74-05129 7C

ELECTROCHEMISTRY
Coulometric Determination of Iron(II)-1,10-Phenanthroline with Cerium(IV),
W74-04867 5A

Voltammetric Behaviour of Copper(III) and Its Analytical Applications,
W74-04870 5A

ELECTRODES
Investigation of the Factors Affecting the Response Time of a Calcium Selective Liquid Membrane Electrode,
W74-05304 2K

ELECTRON MICROSCOPY
Preparation of Filtered Plankton and Detritus for Study with Scanning Electron Microscopy,
W74-05320 5A

ELEPHANT BUTTE RESERVOIR (N
An Analysis of Mercurials in the Elephant Butte Ecosystem,
W74-04859 5B

ELK RIVER (MINN)
Radiological Survey of the Area Surrounding the Elk River Reactor, Elk River, Minnesota.
W74-05179 5B

ENDOCARDIAL REACTIONS
Contribution to the General Pathology of Endocardial Reactions: Toxic Endocardial Lesions in Lower Vertebrates (Carp), (In German),
W74-05308 5C

ENERGY
Composite Energy Fluxes as Factors in Coastal Formation,
W74-05029 2L

ENGINEERING PERSONNEL
Selection, Handling, and Protection of Downhole Materials: A Practical Approach,
W74-05102 8G

ENGLISH LAKE DISTRICT
Bionomics of Cyclops strenuus abyssorm Sars (Copepoda:Cyclopoida),
W74-05344 5C

ENTERIC BACTERIA
Urease Activity of Enterobacteriaceae: Which Medium to Choose,
W74-04888 5A

Population Changes in Enteric Bacteria and Other Microorganisms During Aerobic Thermophilic Windrow Composting,
W74-04908 5D

Identification of Bacteria by Computer: General Aspects and Perspectives,
W74-04909 5A

Identification of Bacteria by Computer: Identification of Reference Strains,
W74-04910 5A

ENVIRONMENT
Man's Environment and the Atlantic Alliance,
W74-05027 6G

Environmental Activities and Programs at the Savannah River Plant.
W74-05173 5B

Environmental Monitoring. Annual Report, 1972, (Atomics International),
W74-05177 5B

General Environmental Siting Guides for Nuclear Power Plants -- Topics and Bases, (Draft).
W74-05180 5G

An Ecological Approach to the Evaluation of Radioactivity Within the Man-Environment Ecosystem,
W74-05182 5B

Radionuclides in the Environment at Nuclear Power Stations,
W74-05183 5B

Environmental Aspects of Natural Gas Stimulation Experiments with Nuclear Devices,
W74-05184 5B

The Year 2000 -- Nuclear Power and Man,
W74-05185 5B

Gamma-Emitting Radionuclides in Alaskan Environments 1967-1970,
W74-05187 5B

Energy and the Environment--Electric Power.
W74-05330 5B

ENVIRONMENT IMPACT
Measuring Impacts of Water Resource Developments on the Human Environment,
W74-05338 6G

ENVIRONMENTAL
Drug Resistance of Coliform Bacteria in Hospital and City Sewage,
W74-05361 5B

ENVIRONMENTAL CONTROL
Regional Environmental Pollution Study: Inventory and Analysis.
W74-05239 5B

Pollution -- Yesterday, Today, and Tomorrow,
W74-05272 5D

Forest Products Pollution Control -- Annotated Bibliography (Excluding Pulp and Paper),
W74-05284 5B

Models for Environmental Pollution Control.
W74-05386 5B

Systems Analysis for Environmental Pollution Control,
W74-05387 5G

ENVIRONMENTAL EFFECTS
The Human Ecological Impact of Structural Flood Control on the Iowa River, Iowa,
W74-04856 8A

The Effects of Hurricane Camille on the Marshes of the Mississippi River Delta,
W74-04875 2L

Tidal Stream Development and Its Effect on the Distribution of the American Oyster,
W74-04878 5C

Effect of Helium Gas at Elevated Pressure on Iron Transport and Growth of Escherichia coli,
W74-04897 5C

On the Measurement of Turbulence in Estuaries,
W74-04933 5B

Aesthetics in Environmental Planning.
W74-04987 6G

Research to Determine the Environmental Response to the Deposition of Spoil on Salt Marshes Using Diked, and Undiked Techniques--First Annual Progress Report,
W74-05075 5C

Radionuclides in Ecosystems, Volume I.
W74-05181 5B

Research to Determine the Environmental Response to the Deposition of Spoil on Salt Marshes Using Diked and Undiked Techniques--First Annual Progress Report,
W74-05332 5C

ENVIRONMENTAL ENGINEERING
Equivalent Pipe Methods for Optimizing Water Networks--Facts and Fallacies,
W74-05383 8A

ENVIRONMENTAL IMPACT
Regional Environmental Pollution Study: Inventory and Analysis.
W74-05239 5B

ENVIRONMENTAL PROTECTION
The Challenge of Environmental Protection and Industrial Development,
W74-05083 6G

ENVIRONMENTAL PROTECTION AGENCY
EXPRO '74--A Listing of Extramural Projects to be Funded in Fiscal Year 1974.
W74-04913 5G

ENVIRONMENTAL PROTECTION MEASURES
Water Resources as a Basis for Comprehensive Planning and Development in the Christina River Basin,
W74-04988 6B

ENVIRONMENTAL QUALITY
Total Environmental Quality Management Models,
W74-05398 5G

ENZYME ACTIVITY
Characteristics of Phosphorus Deficiency in Anabaena,
W74-04905 5C

ENZYMES
Synchronous Cultures of Chlamydomonas Reinhardti: Properties and Regulation of Repressible Phosphatases,
W74-05053 5C

EPHEMERELLA
Contribution to Knowledge of Mayflies of the Amur Basin: I. Imagines (Ephemeroptera:Ephemerellidae), (In Russian),
W74-05380 2I

EQUATIONS OF MOTION
Tidal Dynamics in Estuaries. Part II: Real Estuaries,
W74-04953 2L

EROSION
Acker Lake Landslide, Monroe County, Mississippi,
W74-04862 2J

Residence Time of Sand Composing the Beaches and Bars of Outer Cape Cod,
W74-04968 2J

Experimental Study of River Incision,
W74-05134 2J

What Future for Niagara Falls,
W74-05135 2J

Erosion Control and Vegetative Cover Under Dryland Conditions in Turkey,
W74-05220 3F

Prediction of the Start of Erosion in the Light of Principles of Reliability Theory, (In Russian),
W74-05347 2J

EROSION CONTROL
Comparative Costs of Erosion and Sediment Control, Construction Activities.
W74-04986 4D

Effect of Dibbling of Winter Fallow on Hydrophysical Properties of Frozen Soil and on Erosion Processes (Vliyaniye lunkovaniya zyabi na vodno-fizicheskiye svoystva merzloy pochvy i protsessy erozii),
W74-05019 2G

Erosion Control and Vegetative Cover Under Dryland Conditions in Turkey,
W74-05220 3F

Effect of an Exceptional Storm on Soil Conservation at Samaru, Nigeria,
W74-05340 2J

The Hydrometeorological and Antierosion Effect of Forests in the Eastern Part of the Central Urals (In Russian),
W74-05353 4D

Results of a Second Study of Wind-Eroded Soils in the Pavlodar Priirtyshye (In Russian),
W74-05369 2J

ESTERIFICATION
Esterification of (2,4-Dichlorophenoxy)Acetic Acid - A Quantitative Comparison of Esterification Techniques,
W74-05312 5A

ESTIMATED COSTS
Comparative Costs of Erosion and Sediment Control, Construction Activities.
W74-04986 4D

ESTIMATING
The Estimation of Relative Potency from Two Parabolas in Symmetric Bioassays,
W74-04899 5A

ESTUARIES
A Review of Estuarine Modeling,
W74-04929 2L

On the Measurement of Turbulence in Estuaries,
W74-04933 5B

Sea Surface Temperature and Salinity Conditions in 1969 at Agate Beach and Yaquina Bay, Oregon,
W74-04935 2L

A Study on Mixing and Circulation in the St. Lawrence Estuary Up to 1964,
W74-04944 2L

Estuary and Coastline Hydrodynamics.
W74-04950 2L

Tidal Dynamics in Estuaries. Part I: Estuaries of Rectangular Section,
W74-04952 2L

Tidal Dynamics in Estuaries. Part II: Real Estuaries,
W74-04953 2L

Salinity Intrusion in Estuaries,
W74-04954 2L

Sedimentation in Estuaries,
W74-04955 2L

Field Experience in Estuaries,
W74-04956 2L

Model Laws for Coastal and Estuarine Models,
W74-04957 2L

Tidal and Salinity Model Practice,
W74-04958 2L

Application of Boundary-Layer Theory to Dispersion in Nonstratified Two-Dimensional Estuaries,
W74-04983 2L

Annotated Bibliography on Effects of Salinity and Salinity Changes on Life in Coastal Waters,
W74-05031 2J

Hydrographic Atlas of North Carolina Estuarine and Sound Waters, 1972,
W74-05032 2J

An Experimental Investigation into Effects of Pulp Mill Effluent on Structure of Biological Communities in Alberni Inlet, British Columbia. Part 1: Subtidal Communities,
W74-05047 5C

The Hydrography of the Broadkill River Estuary, Delaware,
W74-05122 2L

ESTUARINE ENVIRONMENT
Phosphates in Sediments of Pamlico Estuary,
W74-05296 5A

EUTROPHICATION
Nutrient Studies in Hyperfertilized Estuarine Ecosystems. I. Phosphorus Studies,
W74-05061 5C

The Fate of Cobalt-60 in a Natural Freshwater Ecosystem,
W74-05203 5C

Daphnia Distribution Within Langmuir Circulations,
W74-05318 5C

Water Quality Models and Aquatic Ecosystems Status, Problems and Perspectives,
W74-05393 5B

EVALUATION
The Identification and Quantification of the Net Effects of Multiple-Purpose River Basin Development,
W74-04854 4A

An Ecological Approach to the Evaluation of Radioactivity Within the Man-Environment Ecosystem,
W74-05182 5B

EVAPORATION
Pan and Lake Evaporation in Pennsylvania,
W74-05121 2D

Effect of Two Impoundments on the Salinity and Quantity of Stored Waters,
W74-05335 5B

EVAPORATION PANS
Pan and Lake Evaporation in Pennsylvania,
W74-05121 2D

Comparison Between Pan and Lake Evaporation,
W74-05155 2D

EVAPORATORS
Methanol Distribution in an Evaporation Plant,
W74-05253 5D

EVAPORIMETERS
Comparison Between Pan and Lake Evaporation,
W74-05155 2D

EVAPOTRANSPIRATION
Transpiration Measurement in Pines Using Tritiated Water as a Tracer,
W74-05197 5B

EXCESS WATER (SOILS)
Effect of Excess Moisture on Trace Element Distribution in Soils of Liningrad Oblast (O vliyanii izbytochnogo uvlazhneniya na raspredeleniye mickroelementov v pochvakh Leningradskoy oblasti),
W74-05148 2G

EXTERNAL CORROSION
Cathodic Protection, Control of External Casing Corrosion,
W74-05085 8G

EXTERNAL EFFECTS
A Regional Planning Model for Water Quality Control,
W74-05390 5B

FALLOUT
Fallout Program Quarterly Summary Report, (Health and Safety Laboratory, AEC, New York),
W74-05174 5A

Fallout Program Quarterly Summary Report - June 1, 1973, Through September 1, 1973, Appendix,
W74-05175 5A

Distribution of Cesium-137 in a Small Watershed in Northern Mississippi,
W74-05191 5B

Ecological Factors Affecting the Accumulation of Cesium-137 Fallout by a Natural Population of Largemouth Bass, (Micropterus Salmoides),
W74-05204 5C

Strontium-90 and Cesium-137 in Water and Deep Sediments of the Great Lakes,
W74-05208 5C

FALLOWING
Effect of Dibbling of Winter Fallow on Hydrophysical Properties of Frozen Soil and on Erosion Processes (Vliyaniye lunkovaniya zyabi na vodno-fizicheskiye svoystva merzloy pochvy i protsessy erozii),
W74-05019 2G

The Summer Fallow System,
W74-05215 3F

FARM MANAGEMENT
Agricultural Aspects,
W74-05002 4A

FARM WASTES
Population Changes in Enteric Bacteria and Other Microorganisms During Aerobic Thermophilic Windrow Composting,
W74-04908 5D

Removal of Nitrogen from Tile Drainage-A Summary Report, Bio-Engineering Aspects of Agricultural Drainage, San Joaquin Valley, California.
W74-05228 5D

Nutrients from Tile Drainage Systems, Bio-Engineering Aspects of Agricultural Drainage, San Joaquin Valley, California.
W74-05229 5B

Agricultural Pollution Control and Enforcement in New York State,
W74-05285 5B

The Use of Mineral Fertilizers in Irrigation with Pure Water, Sewage and Liquid Manure, (In Russian),
W74-05371 3F

FATE OF POLLUTANTS
Degradation of Parathion by Bacteria Isolated from Flooded Soil,
W74-04889 5B

FATHEAD MINNOWS
Histochemical and Cytophotometric Assay of Acid Stress in Freshwater Fish.
W74-05113 5C

FATTY ACIDS
Determination of Trace Amounts of C2-C5 Acids in Aqueous Solutions by Gas Chromatography,
W74-05314 5A

FERN LAKE (WASH
Uptake of Molybdenum Marked with Mo-99, by the Biota of Fern Lake, Washington, in a Laboratory and Field Experiment,
W74-05210 5C

FERROIN
Coulometric Determination of Iron(II)-1,10-Phenanthroline with Cerium(IV),
W74-04867 5A

FERTILIZATION
Density of Growth and Level of Fertilization as Influencing the Water Consumption of Maize, (In Bulgarian),
W74-05339 3F

FERTILIZERS
Slow Releasing Nitrogen Fertilizer from the Waste Product, Lignin Sulphonates,
W74-05249 5B

Effect of Green Fertilizer on Grape Yield,
W74-05346 5B

Toxicity of Sod Podzolic Soils Lysimetric Solutions, (In Russian),
W74-05375 2G

FERTILIZERS (MINERAL)
The Use of Mineral Fertilizers in Irrigation with Pure Water, Sewage and Liquid Manure, (In Russian),
W74-05371 3F

Efficacy of Large Doses of Mineral Fertilizers in Irrigated Soils, (In Russian),
W74-05379 3F

FILTRATION
Treatment of Laundromat Wastes,
W74-05109 5D

FINANCIAL FEASIBILITY
Economic Aspects of a Nuclear Desalination Agro-Industrial Project in the United Arab Republic,
W74-05382 3A

FIRE DANGER
The Effect of Meteorological Factors on Combustibility of Ground Cover and a New Method of Forecasting Fire Danger in Forests of the Kazakh Hills (In Russian),
W74-05352 4A

FIRE PROTECTION (WATER SYSTEMS)
Observing Fire Protection Requirements in Future Water System Design,
W74-05012 5F

FISH
An Analysis of Mercurials in the Elephant Butte Ecosystem,
W74-04859 5B

The Determination of Cobalt in Fish Tissue by Atomic Absorption Spectrophotometry,
W74-05399 5A

FISH DISEASES
Fish Viruses: Isolation and Identification of Infectious Hematopoietic Necrosis in Eastern North America,
W74-05322 5A

FISH FARMING
Combined Rearing of the Pike-Perch Lucioperca lucioperca (L.) and Roach Rutilus rutilus Heckeli (Nordm.) in Liman Fish Farms of Kuban, (In Russian),
W74-04923 8I

FISH GROWTH
Thermal Effects on Biological Production in a Pond,
W74-04861 5C

FISH HATCHERIES
Hood Canal Pond Revision,
W74-05157 8I

FISH HISTOCHEMISTRY
Histochemical and Cytophotometric Assay of Acid Stress in Freshwater Fish.
W74-05113 5C

FISH HOLDING PONDS
Hood Canal Pond Revision,
W74-05157 8I

FISH MANAGEMENT
Hood Canal Pond Revision,
W74-05157 8I

FISH METABOLISM
Study of Metabolic Regulations Between Cyanophyceae and Fish (In Russian),
W74-05327 5C

FISH PARASITES
On the Problem of Host Specificity, Reservoir Parasitism and Secondary Invasions of Camallanus lacustris (Nematoda:Camallanidae), (In Czech),
W74-05359 5C

FISH PATHOLOGY
Histochemical and Cytophotometric Assay of Acid Stress in Freshwater Fish.
W74-05113 5C

FISH POISONS
Changes in Morphological Composition of the Blood of Larval Fish Bitten by Water Bugs Fam. Corixidae), (In Russian),
W74-05209 5C

FISHKILL
Thermal Effects on Biological Production in a Pond,
W74-04861 5C

FLOCCULATION
Treatment for Clarifying White Water Coming from a Groundwood Pulp Mill (Tratamiento para la clarificacion de agua blanca procedente de la fabricacion de pasta de madera),
W74-05245 5D

Installation of Waste Water and Sludge Treatment Facilities at the Arjomari-Prioux Paper Mill at Rives-Sur-Fure (Installation de traitement des eaux residuaires et des boues de la papeterie Arjomari Prioux a Rives-sur-Fure).
W74-05264 5D

FLOOD CONTROL
The Human Ecological Impact of Structural Flood Control on the Iowa River, Iowa,
W74-04856 8A

Optimization of Operation of a System of Flood Control Reservoirs,
W74-04858 4A

Detailed Project Report, Dyersburg, Tennessee, Finley Street Area.
W74-04989 4A

FLOOD DATA
Flood Plain Information: Big Buffalo Creek-Little Buffalo Creek--City of Sanford, North Carolina.
W74-04993 4A

Flood Plain Information; Roanoke River-Chocoyotte Creek; City of Roanoke Rapids and Town of Weldon, North Carolina.
W74-04994 4A

Flood Stages and Discharges for Small Streams in Texas,
W74-05107 2E

Storm of May 5-6, 1973, in the Denver Metro Area: Frequency and Effect,
W74-05171 2E

FLOOD FORECASTING
Forecasting Maximum Flood Levels on the Dniester River (Prognoz maksimal'nykh pavodochnykh uroveny vody r. Dnestra),
W74-05145 4A

FLOOD FREQUENCY
Flood Plain Information; Roanoke River-Chocoyotte Creek; City of Roanoke Rapids and Town of Weldon, North Carolina.
W74-04994 4A

FLOOD PLAIN ZONING
Riverbanks Improvement Program,
W74-05234 6F

FLOOD PLAINS
Flood Plain Information: Big Buffalo Creek-Little Buffalo Creek--City of Sanford, North Carolina.
W74-04993 4A

FLOOD PROFILES
Flood Plain Information; Roanoke River-Chocoyotte Creek; City of Roanoke Rapids and Town of Weldon, North Carolina.
W74-04994 4A

FLOODS
Compositional Modeling of Hydrographs (Kompozitsionnoye modelirovaniye gidrografov),
W74-05146 2A

Storm of May 5-6, 1973, in the Denver Metro Area: Frequency and Effect,
W74-05171 2E

FLORIDA
Taxonomy, Distribution and Ecology of the Genus Sesarma (Crustacea, Decapoda, Grapsidae) in Eastern North America, with Special Reference to Florida,
W74-04880 2I

CERC Bulletin and Summary Report of Research Progress for Fiscal Years 1965-66.
W74-04926 2L

Effect of Wave Action on Tidal Stages Along the Coast of Florida, March 1962,
W74-04927 2L

Quantitative Research on Littoral Drift in Field and Laboratory,
W74-04966 2J

A Proposed Mechanism for the Recycling of Radiocesium in Florida Soil Plant Systems,
W74-05192 5A

FLOTATION
Air Flotation-Biological Oxidation of Synthetic Rubber and Latex Waste-Water,
W74-05105 5D

Closed Water Circulation System in a Paper and Paperboard Mill (Geschlossener Wasserkreislauf in einer Papier-und Kartonfabrik),
W74-05281 5D

FLOW
Numerical Marching Techniques for Fluid Flows with Heat Transfer,
W74-05128 8B

FLOW AUGMENTATION
Effect of Watershed Area Oil Fields on Water Quality,
W74-05079 5B

FLOW MEASUREMENT
Development of a Meter for Measurement of Sewer Flow,
W74-04857 8B

FLOW METER
Development of a Meter for Measurement of Sewer Flow,
W74-04857 8B

FLOW RATES
The Skin Effect in Producing Wells,
W74-05088 8B

FLOW RESISTANCE
Chart Tells Annular Circulation Pressures,
W74-05096 8B

FLUCTUATIONS
Seasonal Variability of Water Temperature in the Vicinity of the Japan Current (Vnutrisezonnaya izmenchivost' temperatury vody v rayone Kurosio),
W74-05150 2E

FLUID FLOW
The Interpretation of Interference Tests in Naturally Fractured Reservoirs with Uniform Fracture Distribution,
W74-05086 8G

FLUORIDE
Influence of Water Intake on the Degree of Incisor Fluorosis and on the Incorporation of Fluoride into Bones and Incisor Teeth of Mice,
W74-05246 5C

FLUORIDES
Some Characteristics of Fluoride Migration in Groundwater of Moldavia (O nekotorykh osobennostyakh migratsii ftora v podzemnykh vodakh Moldavii),
W74-05016 2K

FLUOROMETRIC METHODS
Fluorimetric Method for the Determination of Uranium in Natural Waters,
W74-05240 5A

FLUOROMETRY
Biomass Monitoring of Algal Cultures by Fluorimetric Measurement of Their Chlorophyll Content,
W74-05055 5C

FLUOROSIS (INCISOR)
Influence of Water Intake on the Degree of Incisor Fluorosis and on the Incorporation of Fluoride into Bones and Incisor Teeth of Mice,
W74-05246 5C

FOAM SEPARATION
Oil Recovery System Using Sorbent Material,
W74-04985 5G

FOOD HABITS
Trophic Relations of Aquatic Insects,
W74-05062 5C

FOOD WEBS
Cycling of Zinc-65 in a Simple Food Web,
W74-05202 5C

FORAGES
The Arid Zone Problems in Turkey,
W74-05225 3F

FORECASTING
Computer Simulation of the Hydrologic and Salinity Flow Systems Within the Bear River Basin,
W74-04860 5B

Numerical Prediction on Typhoon Tide in Tokyo Bay,
W74-04971 2L

Worth of Data Used in Digital-Computer Models of Ground-Water Basins,
W74-04975 4B

A Study of the Reliability of Continuous Water Quality Monitoring,
W74-04982 5A

Problems in Hydrologic Forecasting (Voprosy gidrologicheskikh prognozov).
W74-05141 4A

Long-Range Forecast of Duration of Ice Phenomena on the Danube River (Dolgosrochnyy prognoz prodolzhitel'nosti ledovykh yavleniy na r. Dunaye),
W74-05142 2C

Forecasting the Maximum Level of Ice Jams on the Severnaya Dvina River at Arkhangel'sk (Prognoz maksimal'nogo zatornogo urovnya vody r. Severnoy Dviny u g. Arkhangel'ska),
W74-05144 2C

The Year 2000 -- Nuclear Power and Man,
W74-05185 5B

FOREST MANAGEMENT
Wood Waste Reuse in Controlled Release Pesticides,
W74-05286 5D

FOREST SOILS
Calcium Cycling: Diffusion into a Forest Soil,
W74-05200 5B

FORESTS
Water Regime of Sod Podzolic Soils Under Spruce Forests of Different Ages, (In Russian),
W74-05343 4A

The Effect of Meteorological Factors on Combustibility of Ground Cover and a New Method of Forecasting Fire Danger in Forests of the Kazakh Hills (In Russian),
W74-05352 4A

FORT LOUDOUN RESERVOIR (TENN)
A Study of the Reliability of Continuous Water Quality Monitoring,
W74-04982 5A

FRACTURES (GEOLOGIC)
The Interpretation of Interference Tests in Naturally Fractured Reservoirs with Uniform Fracture Distribution,
W74-05086 8G

FRANCE
Installation of Waste Water and Sludge Treatment Facilities at the Arjomari-Prioux Paper Mill at Rives-Sur-Fure (Installation de traitement des eaux residuaires et des boues de la papeterie Arjomari Prioux a Rives-sur-Fure).
W74-05264 5D

Water Resources Management,
W74-05396 6B

FRANCE (RIVER VIENNE)
Mathematical Model for Oxygen Balance in Rivers,
W74-05392 5B

FRESHWATER MARSHES
The Effects of Hurricane Camille on the Marshes of the Mississippi River Delta,
W74-04875 2L

FRICTION
Tidal Dynamics in Estuaries. Part I: Estuaries of Rectangular Section,
W74-04952 2L

Tidal Dynamics in Estuaries. Part II: Real Estuaries,
W74-04953 2L

FROZEN GROUND
An Investigation of Core Drilling in Perennially Frozen Gravels and Rock,
W74-05170 2C

FROZEN SOILS
Effect of Dibbling of Winter Fallow on Hydrophysical Properties of Frozen Soil and on Erosion Processes (Vliyaniye lunkovaniya zyabi na vodno-fizicheskiye svoystva merzloy pochvy i protsessy erozii),
W74-05019 2G

FUNGI
An Appraisal of Identification Methods for Penicillium Species: Novel Taxonomic Criteria Based on Temperature and Water Relations,
W74-04902 5A

Improved pH Control of Fungal Culture Media,
W74-04903 5A

In Vitro Interactions of Fusarium and Verticillium Wilt Fungi with Water, pH and Temperature,
W74-05341 3F

FUSARIUM-OXYSPORUM-F
In Vitro Interactions of Fusarium and Verticillium Wilt Fungi with Water, pH and Temperature,
W74-05341 3F

GALVANIC CORROSION
Ground Water Supplies of Northeastern Illinois -- Quality Problems with Well Waters,
W74-05100 5B

GAS CHROMATOGRAPHY
Oxychlordane Residues in Human Adipose Tissue,
W74-04872 5A

Report on the Composition of Oil from the Region of New Hydrocarbon Upwelling in the Santa Barbara Channel,
W74-04919 5A

Polychlorinated Biphenyls in the Seastar Acanthaster Planci,
W74-05301 5A

Determination of Trace Amounts of C2-C5 Acids in Aqueous Solutions by Gas Chromatography,
W74-05314 5A

Analysis of Primary Aromatic Amines and Nitrite by Diazotization and Pyrolysis Gas Chromatography,
W74-05315 5A

GAS LIQUID CHROMATOGRAPHY
Characterization of Wood-Preserving Coal-Tar Creosote by Gas-Liquid Chromatography,
W74-05306 5A

Esterification of (2,4-Dichlorophenoxy)Acetic Acid - A Quantitative Comparison of Esterification Techniques,
W74-05312 5A

GEOCHEMISTRY
Migration of Elements in River Waters (Migratsiya elementov v rechnykh vodakh),
W74-05022 5B

Basic Patterns in the Distribution of Chemical Elements in Deep-Sea Sediments of the Black Sea (Osnovnyye zakonomernosti raspredeleniya khimicheskikh elementov v tolshche glubokovodnykh osadkov Chernogo morya),
W74-05023 5B

Chemical Aspects of Underground Water,
W74-05080 4B

Possible Cause of Formation of Horizontal Hydrogeochemical Zonality of Groundwater in Central Kazakhstan (O vozmozhnoy prichine vozniknoveniya gorizontal'noy gidrogeokhimicheskoy zonal'nosti podzemnykh vod v Tsentral'nom Kazakhstane) ,
W74-05147 2F

Effect of Excess Moisture on Trace Element Distribution in Soils of Liningrad Oblast (O vliyanii izbytochnogo uvlazhneniya na raspredeleniye mickroelementov v pochvakh Leningradskoy oblasti),
W74-05148 2G

GEOPHYSICS
On the Automatic Computation of Geoelectric Sounding Curves,
W74-05129 7C

GEORGIA
Respiration of a Sublittoral Community,
W74-04874 5B

Area-Wide Water and Sewerage System Plan and Capital Improvement Program.
W74-05242 5D

GEOTHERMAL ENERGY
Geothermal Energy, A National Proposal for Geothermal Resources Research.
W74-04917 2F

Geothermal Resource Investigations, Imperial Valley, California: Special Report Test Well Mesa 6-1.
W74-05139 4B

GEOTHERMAL STUDIES
Geothermal Energy, A National Proposal for Geothermal Resources Research.
W74-04917 2F

Geothermal Resource Investigations, Imperial Valley, California: Special Report Test Well Mesa 6-1.
W74-05139 4B

GERMANY (DANUBE RIVER)
Direct Counts and Plate Counts of Bacteria in the Danube between Berg Spring and Ulm (In German),
W74-05362 5A

GOLCUK LAKE (TURKEY)
Bottom Fauna of Golcuk Lake. 1. Population Study of Chironomids, Chaoborus and Oligochaeta,
W74-05044 5C

GOLD
Water-Pollution Control in the Primary Nonferrous-Metals Industry -- Volume II. Aluminum, Mercury, Gold, Silver, Molybdenum, and Tungsten,
W74-05117 5D

GOVERNMENTAL INTERRELATIONS
A Treatise on Centralized Management of Water Resources,
W74-05030 6E

GOVERNMENTS
Public Control and Regulation,
W74-05082 6E

Urban Water Resources--Politics of Management,
W74-05235 6E

GRADIENT TITRATION
Gradient Titration-A Novel Approach to Continuous Monitoring Using ion-selective Electrodes,
W74-05303 2K

GRAND TRAVERSE BAY (MICH)
Model for Coliform Bacteria in Grand Traverse Bay,
W74-05328 5B

GRANTS
EXPRO '74--A Listing of Extramural Projects to be Funded in Fiscal Year 1974.
W74-04913 5G

GRAPES
Effect of Green Fertilizer on Grape Yield,
W74-05346 5B

GRAPHICAL METHODS
Wellbore Transmissibility from Afterflow-Dominated Pressure Buildup Data,
W74-05101 8G

GRASSLANDS
Invasion of Semidesert Grassland by Velvet Mesquite and Associated Vegetation Changes,
W74-05226 3F

GRAVITY WAVES
Wave Propagation in Continuous Random Media,
W74-05041 2J

GREAT BRITAIN
Report of the Pollution Commission, Part II: Collaboration Between the Water and Oil Industries,
W74-05094 5B

GREAT LAKES
Limnological Survey of Lakes Michigan, Superior, Huron and Erie,
W74-05067 5C

Strontium-90 and Cesium-137 in Water and Deep Sediments of the Great Lakes,
W74-05208 5C

GREAT LAKES REGION
Inventory of Spray Irrigation Systems in the Great Lakes Basin of Canada.
W74-05288 5D

GREENVILLE (N
Reservoir Aeration Improves Water Quality,
W74-05063 5F

GREENWICH (CONN
A Summary Report on the Study of Land and Water Resources in Northeast Greenwich, Connecticut.
W74-04996 4D

GROUNDWATER
Water-Resources Appraisal of the Big Sandy Area, Mohave County, Arizona,
W74-04922 4B

Worth of Data Used in Digital-Computer Models of Ground-Water Basins,
W74-04975 4B

Some Characteristics of Fluoride Migration in Groundwater of Moldavia (O nekotorykh osobennostyakh migratsii ftora v podzemnykh vodakh Moldavii),
W74-05016 2K

Dissolved Oxygen and Iron in Shallow Wells at Salisbury, Md.,
W74-05078 5B

Groundwater in Papua New Guinea,
W74-05084 4B

Interpretation of Boundary Effects from Pumping Test Data,
W74-05089 8B

Design and Use of Radial Collector Wells,
W74-05098 8B

Groundwater Conditions of the Tarai Region,
W74-05131 4B

Possible Cause of Formation of Horizontal Hydrogeochemical Zonality of Groundwater in Central Kazakhstan (O vozmozhnoy prichine vozniknoveniya gorizontal'noy gidrogeokhimicheskoy zonal'nosti podzemnykh vod v Tsentral'nom Kazakhstane) ,
W74-05147 2F

Water Resources Outlook for the Minneapolis-Saint Paul Metropolitan Area, Minnesota,
W74-05172 4B

Subsurface Biological Activity in Relation to Ground Water Pollution,
W74-05230 5B

Groundwater in the Northern Wiso Basin and Environs, Northern Territory,
W74-05331 4B

GROUNDWATER AVAILABILITY
Groundwater in Papua New Guinea,
W74-05084 4B

GROUNDWATER BASINS
The Development and Field Testing of a Basin Hydrology Simulator,
W74-04984 2A

GROUNDWATER MANAGEMENT
Collection of Groundwater Data,
W74-05120 4B

GROUNDWATER MANAGMENT
Evaluation of Ground-Water Data,
W74-05119 4B

GROUNDWATER MOVEMENT
Practical Simulation Models of the Subsurface Hydrologic System with Example Applications,
W74-04973 2F

Chemical Aspects of Underground Water,
W74-05080 4B

Extensive Pumping from Unconfined Aquifers,
W74-05336 4B

GROUNDWATER POLLUTION
Ground Water Supplies of Northeastern Illinois -- Quality Problems with Well Waters,
W74-05100 5B

GROWTH
Density of Growth and Level of Fertilization as Influencing the Water Consumption of Maize, (In Bulgarian),
W74-05339 3F

GROWTH RATES
The Effect of Thyroxine and Triiodothyronine on Bacterial Growth,
W74-04891 5A

Biological Response to Detergent and Nondetergent Phosphorus in Sewage - Part I,
W74-04901 5C

Improved pH Control of Fungal Culture Media,
W74-04903 5A

Breeding and Growth of the Chaetognath Sagitta Elegans in Bedford Basin,
W74-05317 5C

GULF OF ST
PCB Residues in Plankton from the Gulf of St. Lawrence,
W74-05256 5A

HANSENULA POLYMORPHA
Isolation and Characterization of a Thermotolerant Methanol-Utilizing Yeast,
W74-04907 5A

HARBORS
Selection and Design of a Bore Generator for the Hilo Harbor Tsunami Model. Hydraulic Model Investigation,
W74-04946 8B

Edge Bores,
W74-04948 8B

Coastal Processes,
W74-04951 2L

An Evaluation of the Effects of Estuarine Engineering Projects,
W74-05038 5B

HARDNESS (WATER)
Acetylene-Reduction Assay of Anaerobic Nitrogen Fixation by Sediments of Selected Wisconsin Lakes,
W74-05400 5B

HARMONIC ANALYSIS
Tidal Dynamics in Estuaries. Part II: Real Estuaries,
W74-04953 2L

HAWAII
Currents Around the Hawaiian Islands. A Study of Coastal Currents in Respect to Sewage Disposal,
W74-04925 5B

Selection and Design of a Bore Generator for the Hilo Harbor Tsunami Model. Hydraulic Model Investigation,
W74-04946 8B

Eolian Origin of Mica in Hawaiian Soils,
W74-05136 2G

HEAT TRANSFER
Numerical Marching Techniques for Fluid Flows with Heat Transfer,
W74-05128 8B

HEAVY METALS
Removal of Heavy Metals from Mine Drainage by Precipitation,
W74-04851 5D

A Review of Water Analysis by Atomic Absorption,
W74-05292 5A

Inductively Coupled Plasma-Optical Emissic Analytical Spectrometry. A Compact Facili for Trace Analysis of Solutions,
W74-05309 5

Solvent Extraction of Metal Chelates in Water-Immiscible Acetone,
W74-05311 5

HEAVY WATER
Clustering in Supercooled Water,
W74-05251 1

HELIUM
Effect of Helium Gas at Elevated Pressure Iron Transport and Growth of Escherichia co
W74-04897

HEPTAGENIA
Contribution to Knowledge of Mayfli (Ephemeroptera) of the Amur Basin: Imagines (Rhithrogena, Heptagenia), (In R sian),
W74-05381

HERBICIDES
Wood Waste Reuse in Controlled Relea Pesticides,
W74-05286

HERBICIDES (KARMEX) FISH PATHOLOGY
Contribution to the General Pathology of I docardial Reactions: Toxic Endocardial I sions in Lower Vertebrates (Carp), (In G man),
W74-05308

HETEROCYST PRODUCTION
Ascorbic Acid and Heterocyst Development the Blue-Green Alga Anabaena Ambigua,
W74-05052

HETEROGENEITY
How Areal Heterogeneities Affect Pulse-T Results,
W74-05092

HEXACHLOROBENZENE
Confirmation of Hexachlorobenzene by Che cal Reaction,
W74-04871

HICKORY
Accumulation of Ce-144 by Hickory and Co by Black Gum Seedlings,
W74-05196

HIGH PRESSURE
Effect of Helium Gas at Elevated Pressure Iron Transport and Growth of Escherichia c
W74-04897

HOGS
Population Changes in Enteric Bacteria Other Microorganisms During Aerobic Thermophilic Windrow Composting,
W74-04908

HOT SPRINGS
Mixture, a Computer Program for the Calc tion of Hot Water Temperature and Mix Fractions of Large Volume Warm Springs Mixed Water Origin,
W74-05156

HUDSON RIVER
Combined Sewer Overflow for The Hud River Conference,
W74-05112

HUMAN ENVIRONMENT
Measuring Impacts of Water Resource Developments on the Human Environment,
W74-05338 6G

HUMUS
The Influence of Precipitation and Altitude on the Humus Content of East African Soils (In German),
W74-05058 2G

HUMUS DECOMPOSITION
Soil Respiration, Nitrogen Mineralization and Humus Decomposition of East African Soils after Drying and Remoistening (In German),
W74-05054 2G

HUMUS LAYERS
Investigations on the Transfer of Bioelements from Organic Matter to Soil Solution in the Humus Layer of a Beech Stand (In German),
W74-05367 2G

HUNTSVILLE (ALA)
Environmental Geology and Hydrology, Madison County, Alabama: Water Resources,
W74-04911 4B

HURRICANES
The Effects of Hurricane Camille on the Marshes of the Mississippi River Delta,
W74-04875 2L

Hurricane Studies for Narragansett Bay,
W74-04970 8B

An Evaluation of the Effects of Estuarine Engineering Projects,
W74-05038 5B

HYDRANTS
Valves, Hydrants, and Main Line Meters,
W74-05014 5F

HYDRAULIC MODELS
Selection and Design of a Bore Generator for the Hilo Harbor Tsunami Model. Hydraulic Model Investigation,
W74-04946 8B

Enlargement of the Chesapeake and Delaware Canal, Hydraulic and Mathematical Model Investigation,
W74-05036 8B

Study of Beach Widening by the Perched Beach Concept Santa Monica Bay, California. Hydraulic Model Investigation,
W74-05039 8B

Interpretation of Boundary Effects from Pumping Test Data,
W74-05089 8B

HYDRAULICS
Hydraulics of Water Distribution Systems,
W74-05007 5F

Applications of System Analyzers: A Summary,
W74-05008 5F

HYDRIC REGIME
Hydric Regime of an Argiudol (In Spanish),
W74-05324 2G

HYDROBIOLOGY
Hydrobiological Studies 2.
W74-05068 5C

HYDRODYNAMICS
Estuary and Coastline Hydrodynamics.
W74-04950 2L

HYDROELECTRIC POWER
Mathematical Approach to Water Resources Management in Italy,
W74-05397 6A

HYDROGEN ION CONCENTRATION
Survival of Brook Trout in a Bog-Derived Acidity Gradient,
W74-04873 5C

Improved pH Control of Fungal Culture Media,
W74-04903 5A

Soil as a Medium for the Renovation of Acid Mine Drainage Water,
W74-04981 5D

Low pH Levels Wipe Out Salmon and Trout Populations in Southernmost Norway,
W74-05356 5C

HYDROGEN PEROXIDE
The Production of Hydrogen Peroxide by Blue-Green Algae: A Survey,
W74-04882 5C

HYDROGEOLOGY
Evaluation of Ground-Water Data,
W74-05119 4B

Collection of Groundwater Data,
W74-05120 4B

Spacing of Hard Rock Shallow Wells,
W74-05133 4B

Groundwater Resources of the Vale of Clwyd.
W74-05168 4B

Water Resources Outlook for the Minneapolis-Saint Paul Metropolitan Area, Minnesota,
W74-05172 4B

Groundwater in the Northern Wiso Basin and Environs, Northern Territory,
W74-05331 4B

HYDROGRAPHS
The Application of Binary Tree Structures to Hydrologic Network Simulators,
W74-04852 4A

HYDROGRAPHYS
Compositional Modeling of Hydrographs (Kompozitsionnoye modelirovaniye gidrografov),
W74-05146 2A

HYDROLOGIC DATA
Advisory Committee on Water Data for Public Use--Summary of Eighth Meeting, June 5-7, 1973, Portland Oregon.
W74-04924 7C

Borehole Sampling of Satuarated Uncemented Sands and Gravels,
W74-05081 8G

Flood Stages and Discharges for Small Streams in Texas,
W74-05107 2E

Evaluation of Ground-Water Data,
W74-05119 4B

Collection of Groundwater Data,
W74-05120 4B

HYDROLOGIC SYSTEMS
Computer Simulation of the Hydrologic and Salinity Flow Systems Within the Bear River Basin,
W74-04860 5B

HYDROLOGY
Hydrobiological Studies 2.
W74-05068 5C

Problems in Hydrologic Forecasting (Voprosy gidrologicheskikh prognozov).
W74-05141 4A

HYDROSCOPICITY
Study of Condensed Water Accumulation in Sandy Desert, (In Russian),
W74-05115 2G

HYSTERESIS
Soil-Water-Potentials Depending on Temperature, (In German),
W74-05372 2G

ICE
The Effect of Impurities on the Mechanical Properties of Ice Single Crystals,
W74-04914 2C

Long-Range Forecast of Duration of Ice Phenomena on the Danube River (Dolgosrochnyy prognoz prodolzhitel'nosti ledovykh yavleniy na r. Dunaye),
W74-05142 2C

Effect of Hydrometeorological Conditions on Time of Ice Formation on Rivers in the Baltic Sea Region and Belorussia (Vliyaniye gidrometeorologicheskikh uslovity na sroki poyavleniya l'da na rekakh Pribaltiki i Belorussii),
W74-05143 2C

Forecasting the Maximum Level of Ice Jams on the Severnaya Dvina River at Arkhangel'sk (Prognoz maksimal'nogo zatornogo urovnya vody r. Severnoy Dviny u g. Arkhangel'ska),
W74-05144 2C

ICE COVER
Long-Range Forecast of Duration of Ice Phenomena on the Danube River (Dolgosrochnyy prognoz prodolzhitel'nosti ledovykh yavleniy na r. Dunaye),
W74-05142 2C

Effect of Hydrometeorological Conditions on Time of Ice Formation on Rivers in the Baltic Sea Region and Belorussia (Vliyaniye gidrometeorologicheskikh uslovity na sroki poyavleniya l'da na rekakh Pribaltiki i Belorussii),
W74-05143 2C

Forecasting the Maximum Level of Ice Jams on the Severnaya Dvina River at Arkhangel'sk (Prognoz maksimal'nogo zatornogo urovnya vody r. Severnoy Dviny u g. Arkhangel'ska),
W74-05144 2C

ICE JAMS
Forecasting the Maximum Level of Ice Jams on the Severnaya Dvina River at Arkhangel'sk (Prognoz maksimal'nogo zatornogo urovnya vody r. Severnoy Dviny u g. Arkhangel'ska),
W74-05144 2C

ICE MECHANICS
Redistribution Functions and Their Yield Surfaces in a Plastic Theory of Pack Ice Deformation,
W74-05161 2C

Dimensionless Strength Parameters for Floating Ice Sheets,
W74-05162 2C

IHN VIRUS
Fish Viruses: Isolation and Identification of Infectious Hematopoietic Necrosis in Eastern North America,
W74-05322 5A

ILLINOIS
Ground Water Supplies of Northeastern Illinois -- Quality Problems with Well Waters,
W74-05100 5B

Reuse of Solid Waste from Water-Softening Processes,
W74-05127 5D

IMMISSION DAMAGE
The Nonparasitic Diseases. Immission Damage (Gas, Smoke and Dust Damage). Waste Water Damage Including Damage Caused by Solid Wastes,.
W74-05342 5C

IMPACT ANALYSIS
Economic, Social and Environmental Impacts of Public Works, Vol. I Pittsburgh Area Studies, Vol. II. The Alegheny County Sanitary Authority (AlCoSan) Facility, Vol. III. Impact Analysis,
W74-05231 6B

Sewage Collection and Treatment Systems: Issues in and Approaches to Impact Analysis,
W74-05241 6B

IMPACT STATEMENTS
Economic, Social and Environmental Impacts of Public Works, Vol. I Pittsburgh Area Studies, Vol. II. The Alegheny County Sanitary Authority (AlCoSan) Facility, Vol. III. Impact Analysis,
W74-05231 6B

IMPERIAL VALLEY (CALIF)
Geothermal Resource Investigations, Imperial Valley, California: Special Report Test Well Mesa 6-1.
W74-05139 4B

IMPINGEMENT
Unusual Cases of Copper Corrosion,
W74-05097 8G

IN-SITU FREEZING
Borehole Sampling of Satuarated Uncemented Sands and Gravels,
W74-05081 8G

INCINERATION
Removal of Residual Waste Water Sludges (Beseitigung der Restabwasserschlaemme),
W74-05263 5D

Whither Clarified Sludge. (Wohin mit dem Klaerschlamm.),
W74-05266 5E

INDIA
Preliminary Studies on the Mechanisms Controlling the Salinity in Northwestern Arid Region of India--a Discussion on the Causes of Salinity in the Groundwater Regime,
W74-05132 2F

Spacing of Hard Rock Shallow Wells,
W74-05133 4B

INDIA (CHANDIGARH)
Chemical Composition of Monsoon Rainwater Over Chandigarh in 1971,
W74-05130 2B

INDIA (KAKINADA BAY)
Coastal Circulation Near Kakinada Bay During Monsoon Period,
W74-04941 2L

INDIA (TARAI REGION)
Groundwater Conditions of the Tarai Region,
W74-05131 4B

INDIANA
Application of Multigoal Water Quality Planning Model,
W74-05384 5D

A Regional Planning Model for Water Quality Control,
W74-05390 5B

INDUSTRIAL WASTES
Water-Pollution Control in the Primary Nonferrous-Metals Industry -- Volume I. Copper, Zinc, and Lead Industries,
W74-05116 5D

Water-Pollution Control in the Primary Nonferrous-Metals Industry -- Volume II. Aluminum, Mercury, Gold, Silver, Molybdenum, and Tungsten,
W74-05117 5D

A Starch-Free Effluent Program for Corrugating Plants,
W74-05250 5B

Water and Waste Water Problems in Modern Textile Finishing Plants (Wasser- und Abwasserprobleme im modernen Textilveredlungsbetrieb),
W74-05255 5D

'Barovibra' BOD Measuring Apparatus (Barovibra-BSB-Messgeraet),
W74-05265 5A

Forest Products Pollution Control -- Annotated Bibliography (Excluding Pulp and Paper),
W74-05284 5B

Agricultural Pollution Control and Enforcement in New York State,
W74-05285 5B

Inventory of Spray Irrigation Systems in the Great Lakes Basin of Canada.
W74-05288 5D

INDUSTRIAL WATER
Closed Water Circulation System in a Paper and Paperboard Mill (Geschlossener Wasserkreislauf in einer Papier-und Kartonfabrik),
W74-05281 5D

A Pulp and Paper Mill with Fully Closed Recirculation System -- Utopia or Realistic Possibility. (Eine Zellstoff-und Papierfabrik mit vollstaendig geschlossenem Kreislauf -- eine Utopie oder eine realistische Moeglichkeit),
W74-05289 5D

INFECTIOUS HEMATOPOIETIC NECROSIS
Fish Viruses: Isolation and Identification of Infectious Hematopoietic Necrosis in Eastern North America,
W74-05322 5A

INFLOW
The Skin Effect in Producing Wells,
W74-05088 8B

INPUT-OUTPUT ANALYSIS
Investigations on the Transfer of Bioelements from Organic Matter to Soil Solution in the Humus Layer of a Beech Stand (In German),
W74-05367 2G

INSECTICIDES
Effect of Organic Insecticides upon Carbon-14 Uptake by Freshwater Phytoplankton,
W74-05211 5C

INSECTS
Contribution to Knowledge of Mayflies of the Amur Basin: I. Imagines (Ephemeroptera:Ephemerellidae), (In Russian),
W74-05380 2I

Contribution to Knowledge of Mayflies (Ephemeroptera) of the Amur Basin: II Imagines (Rhithrogena, Heptagenia), (In Russian),
W74-05381 2

INSTITUTIONAL CONSTRAINTS
Detailed Project Report, Dyersburg, Tennessee, Finley Street Area.
W74-04989 4A

INSTRUMENTATION
Pulsed D.C. Motor Speed Control for Portable Instrumentation,
W74-04895 7E

Domestic Service Meters,
W74-05015 5I

Annotated Bibliography on Precipitation Measurement Instruments,
W74-05169 2I

'Barovibra' BOD Measuring Apparatus (Barovibra-BSB-Messgeraet),
W74-05265 5A

INTER-BASIN TRANSFERS
The Economic Efficiency of Inter-Basin Agricultural Water Transfers in Utah: A Mathematical Programming Approach,
W74-05385 4A

INTERFACES
Nonlinear Development of the Rayleigh-Taylor Instability in the 'Shallow-Water' Approximation,
W74-05034 2

INTERFERENCE TESTS
The Interpretation of Interference Tests in Naturally Fractured Reservoirs with Uniform Fracture Distribution,
W74-05086 8G

INTERNATIONAL WATERS
Potentials of Tidal Power on the North Atlantic Coast in Canada and United States,
W74-04972 2

INTERSTATE
Reasonable State Regulation of the Interstate Transfer of Percolating Water,
W74-04980 4

INTERSTATE COMMISSION
Combined Sewer Overflow for The Hudson River Conference,
W74-05112 5

INTERSTATE COMMISSIONS
Interstate Planning for Regional Water Supply and Pollution Control.
W74-05108 5

INVASION
The Relationship of Soil Temperature and Cytokinin Production in Aspen Invasion,
W74-04978 2I

INVESTMENT
Economic Aspects of a Nuclear Desalination Agro-Industrial Project in the United Arab Republic,
W74-05382 3A

ION EXCHANGE
Treatment of Laundromat Wastes,
W74-05109 5D

Fluorimetric Method for the Determination of Uranium in Natural Waters,
W74-05240 5A

Isolation and Chemical Identification of Toxic Components of Kraft Mill Wastes,
W74-05270 5A

ION SELECTIVE ELECTRODES
Gradient Titration-A Novel Approach to Continuous Monitoring Using ion-selective Electrodes,
W74-05303 2K

IONIC INTERFERENCE
Investigation of the Factors Affecting the Response Time of a Calcium Selective Liquid Membrane Electrode,
W74-05304 2K

IOWA RIVER (IOWA)
The Human Ecological Impact of Structural Flood Control on the Iowa River, Iowa,
W74-04856 8A

IRAN
Agricultural Aspects of Arid and Semi-Arid Zones,
W74-05216 3F

General Report on Development and Utilization of Saline Soils in Iran,
W74-05218 3C

IRAN (GARMSAR AREA)
Possibilities of Supply and Proper use of Water in the Garmsar Area,
W74-05217 3C

IRIDIUM
Fallout Program Quarterly Summary Report, (Health and Safety Laboratory, AEC, New York),
W74-05174 5A

Fallout Program Quarterly Summary Report - June 1, 1973, Through September 1, 1973, Appendix,
W74-05175 5A

IRON
Coulometric Determination of Iron(II)-1,10-Phenanthroline with Cerium(IV),
W74-04867 5A

Effect of Helium Gas at Elevated Pressure on Iron Transport and Growth of Escherichia coli,
W74-04897 5C

Soil as a Medium for the Renovation of Acid Mine Drainage Water,
W74-04981 5D

Ground Water Supplies of Northeastern Illinois -- Quality Problems with Well Waters,
W74-05100 5B

IRON BACTERIA
Dissolved Oxygen and Iron in Shallow Wells at Salisbury, Md.,
W74-05078 5B

IRRIGATED LAND
Inventory of Spray Irrigation Systems in the Great Lakes Basin of Canada.
W74-05288 5D

IRRIGATION
Planning for the Ultimate Hydraulic Development of the Nile Valley,
W74-04997 4A

The Soils of the Ural River Zone in the Gurev Region and their Improvements During Irrigation, (In Russian),
W74-05205 2G

Possibilities of Supply and Proper use of Water in the Garmsar Area,
W74-05217 3C

Some Data on Secondary Salinization of Krasnoznamenskii Irrigated Massif, (In Russian),
W74-05376 3F

Mathematical Approach to Water Resources Management in Italy,
W74-05397 6A

IRRIGATION PROGRAMS
Collaboration of the U.S.S.R. and the U.S.A. in the Field of Hydraulic Engineering and Land Reclamation,
W74-05076 6E

Economic Aspects of a Nuclear Desalination Agro-Industrial Project in the United Arab Republic,
W74-05382 3A

IRRIGATION WATER
Wheat Production Problems and Potentials on Drylands,
W74-05221 3F

ISLANDS
Currents Around the Hawaiian Islands. A Study of Coastal Currents in Respect to Sewage Disposal,
W74-04925 5B

ISOLATION
Recovery and Identification of Anaerobes: A System Suitable for the Routine Clinical Laboratory,
W74-04886 5A

Isolation and Characterization of a Thermotolerant Methanol-Utilizing Yeast,

AEC Implementation of the National Environmental Policy Act in Its Licensing and Regulation of Nuclear Facilities,
W74-05186 5G

LEISURE
North Carolina Water Plan-Progress Report-Chapter 22, Water Based Recreation.
W74-04990 6B

LETHAL LIMIT
Ultimate Upper Lethal Temperature of Atlantic Salmon Salmo salar L.,
W74-04869 5C

LEVEES
Detailed Project Report, Dyersburg, Tennessee, Finley Street Area.
W74-04989 4A

LICENSING
Public Control and Regulation,
W74-05082 6E

LICHENS
Recent Measurements of Cesium-137 in Residence Time in Alaskan Vegetation,
W74-05188 5B

LIGANDS
Voltammetric Behaviour of Copper(III) and Its Analytical Applications,
W74-04870 5A

LIGHT INTENSITY
Research on Red Algal Pigments. 5. The Effect of the Intensity of White and Green Light on

the Rate of Photosynthesis and its Relationship to Pigment Components in Gracilaria Compressa (C. AG.) Grev. (Rhodophyceae, Gigartinales),
W74-05300 5C

IGNINS
Slow Releasing Nitrogen Fertilizer from the Waste Product, Lignin Sulphonates,
W74-05249 5B

Wood Waste Reuse in Controlled Release Pesticides,
W74-05286 5D

IME TREATMENT
Kraft Pulping Effluent Treatment and Reuse - State of the Art,
W74-05110 5D

IMESTONES
Ground-Water Resources of the San Antonio Area, Texas: A Progress Report on Studies, 1960-1964,
W74-04992 4B

IMITING FACTORS
Biological Response to Detergent and Nondetergent Phosphorus in Sewage - Part I,
W74-04901 5C

IMNOLOGY
Limnological Survey of Lakes Michigan, Superior, Huron and Erie,
W74-05067 5C

Hydrobiological Studies 2.
W74-05068 5C

Limnology of Two Re-Regulation Reservoirs in Czechoslovakia,
W74-05073 5C

INEAR PROGRAMMING
Optimization of Operation of a System of Flood Control Reservoirs,
W74-04858 4A

IPIDS
Lipopolysaccharide from a Gram-Negative Marine Bacterium,
W74-04896 5A

IPOPOLYSACCHARIDES
Lipopolysaccharide from a Gram-Negative Marine Bacterium,
W74-04896 5A

IQUID MEMBRANE ELECTRODES
Investigation of the Factors Affecting the Response Time of a Calcium Selective Liquid Membrane Electrode,
W74-05304 2K

ISTERIA-MONOCYTOGENES
Comparative Study of the Effect of Some Anion Active Detergents on the Reproduction of Listeria monocytogenes and Other Bacteria,
W74-05360 5C

ITTLE ARKANSAS RIVER BASIN (KAN)
The Development and Field Testing of a Basin Hydrology Simulator,
W74-04984 2A

ITTORAL
Respiration of a Sublittoral Community,
W74-04874 5B

Littoral Processes - Quantitative Treatment,10B. Le Mehaute.
W74-04931 2J

Coastal Processes,
W74-04951 2L

LITTORAL DRIFT
Cause and Prediction of Beach Erosion,
W74-04945 2J

Wave Energy and Littoral Transport,
W74-04965 2J

Quantitative Research on Littoral Drift in Field and Laboratory,
W74-04966 2J

LOAM
Water-Holding Capacity of Coarse and Medium Loesslike Loams (O vodouderzhivayushchey sposobnosti legkikh i srednikh lessovidnykh suglinkov),
W74-05020 2G

LOCAL GOVERNMENTS
Development of Water Facilities--Broome County, 1967-2017.

MANGANESE
A Technique for Extraction and Storage of Water Samples for Mn, Cd, and Pb Determination by Atomic Absorption Spectroscopy,
W74-05293 5A

Effect of Trace Elements on the Water Regimen, the Decorative Qualities and the Seed Yield of Some Ornamental Plants, (In Russian),
W74-05345 5C

MAPPATES PLATEXUS
Redescription of Mappates plataxus Rangnekar (Copepoda: Caligidae),
W74-04877 2I

MARCHING PROCEDURES (MATHEMATICAL)
Numerical Marching Techniques for Fluid Flows with Heat Transfer,
W74-05128 8B

MARINE ALGAE
Species of Oceanic Dinoflagellates in the Genera Dissodinium and Pyrocystis: Interclonal and Interspecific Comparisons of the Color and Photon Yield of Bioluminescence,
W74-04883 5B

MARINE ANIMALS
Respiration of a Sublittoral Community,
W74-04874 5B

Paraffin Hydrocarbon Patterns in Petroleum-Polluted Mussels,
W74-05326 5A

MARINE BACTERIA
Lipopolysaccharide from a Gram-Negative Marine Bacterium,
W74-04896 5A

MARINE FISH
Effects of Red Mud on Marine Animals,
W74-05325 5C

MARINE PLANTS
The Effects of Hurricane Camille on the Marshes of the Mississippi River Delta,
W74-04875 2L

MASS SPECTROMETRY
Oxychlordane Residues in Human Adipose Tissue,
W74-04872 5A

Field Ionization Mass Spectrometry: A New Tool for the Analytical Chemist,
W74-05302 5A

MASS WASTING
Acker Lake Landslide, Monroe County, Mississippi,
W74-04862 2J

MASSACHUSETTS
Residence Time of Sand Composing the Beaches and Bars of Outer Cape Cod,
W74-04968 2J

MATHEMATICAL MODELS
Enlargement of the Chesapeake and Delaware Canal, Hydraulic and Mathematical Model Investigation,
W74-05036 8B

Pulse-Test Response of a Two-Zone Reservoir,
W74-05077 4B

The Interpretation of Interference Tests in Naturally Fractured Reservoirs with Uniform Fracture Distribution,
W74-05086 8G

A Mathematical Model for Optimizing the Design of Reverse Osmosis Systems,
W74-05276 5D

Model for Coliform Bacteria in Grand Traverse Bay,
W74-05328 5B

Models for Environmental Pollution Control.
W74-05386 5B

Systems Analysis for Environmental Pollution Control,
W74-05387 5G

Water Quality Models and Aquatic Ecosystems Status, Problems and Perspectives,
W74-05393 5B

Models of Water Supply Systems,
W74-05394 4A

MAYFLIES
Contribution to Knowledge of Mayflies of the Amur Basin: I. Imagines (Ephemeroptera:Ephemerellidae), (In Russian),
W74-05380 2I

Contribution to Knowledge of Mayflies (Ephemeroptera) of the Amur Basin: II. Imagines (Rhithrogena, Heptagenia), (In Russian),
W74-05381 2I

MEASUREMENT
Radiological Survey of the Area Surrounding the Elk River Reactor, Elk River, Minnesota.
W74-05179 5B

An Ecological Approach to the Evaluation of Radioactivity Within the Man-Environment Ecosystem,
W74-05182 5B

Gamma-Emitting Radionuclides in Alaskan Environments 1967-1970,
W74-05187 5B

Recent Measurements of Cesium-137 in Residence Time in Alaskan Vegetation,
W74-05188 5B

Cesium-137 in White-Tailed Deer as Related to Vegetation and Soils of the Southeastern United States,
W74-05190 5B

MEASUREMENTS
Low-Level Radioactivity Measurements,
W74-05178 5A

MEASURING INSTRUMENTS
Low-Level Radioactivity Measurements,

An Analysis of Mercurials in the Elephant Butte Ecosystem,
W74-04859 5B

MERCURY
An Analysis of Mercurials in the Elephant Butte Ecosystem,
W74-04859 5B

Water-Pollution Control in the Primary Nonferrous-Metals Industry -- Volume II. Aluminum, Mercury, Gold, Silver, Molybdenum, and Tungsten,
W74-05117 5D

Organomercurials in the Environment,
W74-05248 5B

Preservation of Dilute Mercury Solutions,
W74-05310 5A

MERCURY COMPOUNDS
Organomercurials in the Environment,
W74-05248 5B

MESOZOIC ERA
Characteristics of Organic-Matter Distribution in Calcareous Sediments of the Caspian Sea and in Mesozoic Carbonate Rocks of the Southeastern Caucasus (Osobennosti raspredeleniya organicheskogo veshchestva v izvestkovykh osadkakh Kaspiyskogo morya i karbonatnykh porodakh mezozoya yugo-vostochnogo Kavkaza),
W74-05021 5B

MESQUITE
Invasion of Semidesert Grassland by Velvet Mesquite and Associated Vegetation Changes,
W74-05226 3F

METAL
Solvent Extraction of Metal Chelates in Water-Immiscible Acetone,
W74-05311

METAL CHELATES
A Technique for Extraction and Storage Water Samples for Mn, Cd, and Pb Determination by Atomic Absorption Spectroscopy,
W74-05293

METAL COMPLEXES
Voltammetric Behaviour of Copper(III) and Analytical Applications,
W74-04870

METALS
Determination of Eight Metals in the International Biological Standard by Flame Atomic-Absorption Spectrometry,
W74-04868

Water-Pollution Control in the Primary Nonferrous-Metals Industry -- Volume I. Copper, Zinc, and Lead Industries,
W74-05116

Water-Pollution Control in the Primary Nonferrous-Metals Industry -- Volume II. Aluminum, Mercury, Gold, Silver, Molybdenum, and Tungsten,
W74-05117

METEOROLOGY
Problems in Hydrologic Forecasting (Voprosy gidrologicheskikh prognozov).
W74-05141

Long-Range Forecast of Duration of Phenomena on the Danube River (Dolgosrochnyy prognoz prodolzhitel'nosti ledovykh yavleniy na r. Dunaye),
W74-05142

Effect of Hydrometeorological Conditions on Time of Ice Formation on Rivers in the Baltic Sea Region and Belorussia (Vliyanie gidrometeorologicheskikh uslovity na sroki poyavleniya l'da na rekakh Pribaltiki i Belorussii),
W74-05143

20-24 Year Cycle in the March of Atmospheric Precipitation and Its Relation to Air Circulation Patterns (Tsikl 20-24 goda v khode atmosfernykh osadkov i yego svyza' s osobennostyami atmosfernoy tsirkulyatsii),
W74-05149

METHANOL
Isolation and Characterization of a Thermotolerant Methanol-Utilizing Yeast,
W74-04907

METHODOLOGY
Confirmation of Hexachlorobenzene by Chemical Reaction,
W74-04871

Introduction to Simulation Techniques,
W74-05391

MEXICO
Treatment for Clarifying White Water Coming from a Groundwood Pulp Mill (Tratamiento para la clarificacion de agua blanca procedente de la fabricacion de pasta de madera),
W74-05245

MICE
Influence of Water Intake on the Degree of Incisor Fluorosis and on the Incorporation of Fluoride into Bones and Incisor Teeth of Mice,
W74-05246 5C

MICHIGAN
Ecological Factors Affecting the Accumulation of Cesium-137 Fallout by a Natural Population of Largemouth Bass, (Micropterus Salmoides),
W74-05204 5C

Saginaw County Water and Wastewater Utility Master Plan.
W74-05243 5D

Model for Coliform Bacteria in Grand Traverse Bay,
W74-05328 5B

MICROBIAL DEGRADATION
Degradation of Parathion by Bacteria Isolated from Flooded Soil,
W74-04889 5B

MICROBIOLOGY
Subsurface Biological Activity in Relation to Ground Water Pollution,
W74-05230 5B

MICROCULTURE METHODS
Microcultures of Brown Bullhead (Ictalurus nebulosus) Cells: Their Use in Quantitation of Channel Catfish (Ictalurus punctatus) Virus and Antibody,
W74-05323 5A

MICROWAVE RADIOMETRY
A Theory of Microwave Apparent Temperature Over the Ocean,
W74-05126 2B

MICROWAVES
A Theory of Microwave Apparent Temperature Over the Ocean,
W74-05126 2B

MIDGES
Bottom Fauna of Golcuk Lake. 1. Population Study of Chironomids, Chaoborus and Oligochaeta,
W74-05044 5C

MIKOLAJSKIE LAKE (POLAND)
Spatial Differentiation and Changes in Time of Zoomicrobenthos in Three Masurian Lakes,
W74-05050 5C

Spatial Differentiation Abundance of Bacteria in the Water of Mikolajskie Lake,
W74-05051 5C

MINE DRAINAGE
Removal of Heavy Metals from Mine Drainage by Precipitation,
W74-04851 5D

MINE WASTES
Removal of Heavy Metals from Mine Drainage by Precipitation,
W74-04851 5D

MINE WATER
Abatement of Mine Drainage Pollution by Underground Precipitation,
W74-05106 5G

MINERAL COMPOUNDS
Comparative Study of the Physicochemical Properties of Meliorated and Non-Meliorated Soils at the Mugan Experimental Melioration Station, (In Russian),
W74-05037 2G

MINERALIZATION
Soil Respiration, Nitrogen Mineralization and Humus Decomposition of East African Soils after Drying and Remoistening (In German),
W74-05054 2G

MINING
Controlled Solution Mining in Massive Salt,
W74-05103 8B

MINNEAPOLIS (MINN)
Water Resources Outlook for the Minneapolis-Saint Paul Metropolitan Area, Minnesota,
W74-05172 4B

MINNESOTA
Water Resources Outlook for the Minneapolis-Saint Paul Metropolitan Area, Minnesota,
W74-05172 4B

Radiological Survey of the Area Surrounding the Elk River Reactor, Elk River, Minnesota.
W74-05179 5B

MISSISSIPPI
Acker Lake Landslide, Monroe County, Mississippi,
W74-04862 2J

A Treatise on Centralized Management of Water Resources,
W74-05030 6E

Distribution of Cesium-137 in a Small Watershed in Northern Mississippi,
W74-05191 5B

Recycling Water -- A Simple Solution,
W74-05274 5D

MISSISSIPPI RIVER DELTA
The Effects of Hurricane Camille on the Marshes of the Mississippi River Delta,
W74-04875 2L

MIXING
Bomex Rainy Day Analysis,
W74-04921 2B

Longshore Currents Generated by Obliquely Incident Sea Waves,
W74-04943 2E

A Study on Mixing and Circulation in the St. Lawrence Estuary Up to 1964,
W74-04944 2L

Field Experience in Estuaries,
W74-04956 2L

Model Laws for Coastal and Estuarine Models,
W74-04957 2L

Control of Algae by Mixing,
W74-05064 5G

Numerical Marching Techniques for Fluid Flows with Heat Transfer,
W74-05128 8B

Mixture, a Computer Program for the Calculation of Hot Water Temperature and Mixing Fractions of Large Volume Warm Springs of Mixed Water Origin,
W74-05156 7C

MODEL STUDIES
Computer Simulation of the Hydrologic and Salinity Flow Systems Within the Bear River Basin,
W74-04860 5B

A Review of Estuarine Modeling,
W74-04929 2L

Coastal Movable Bed Scale Model Technology,
W74-04949 2J

Model Laws for Coastal and Estuarine Models,
W74-04957 2L

Tidal and Salinity Model Practice,
W74-04958 2L

Water Resources as a Basis for Comprehensive Planning and Development in the Christina River Basin,
W74-04988 6B

Compositional Modeling of Hydrographs (Kompozitsionnoye modelirovaniye gidrografov),
W74-05146 2A

Prediction of the Start of Erosion in the Light of Principles of Reliability Theory, (In Russian),
W74-05347 2J

Modeling of Wastewater Disposal Systems,
W74-05388 5D

Total Environmental Quality Management Models,
W74-05398 5G

MOISTURE
Study of Condensed Water Accumulation in Sandy Desert, (In Russian),
W74-05115 2G

Moisture and Temperature Regimes in the Southern-Taiga Soils of Central Siberia and Habitat Conditions for Crops, (In Russian),
W74-05373 3F

MOISTURE UPTAKE
Transpiration Measurement in Pines Using Tritiated Water as a Tracer,
W74-05197 5B

MOLECULAR TRACERS
Field Ionization Mass Spectrometry: A New Tool for the Analytical Chemist,
W74-05302 5A

MOLYBDENUM
Water-Pollution Control in the Primary Nonferrous-Metals Industry -- Volume II. Aluminum, Mercury, Gold, Silver, Molybdenum, and Tungsten,
W74-05117 5D

Uptake of Molybdenum Marked with Mo-99, by the Biota of Fern Lake, Washington, in a Laboratory and Field Experiment,
W74-05210 5C

MONITORING
Pulsed D.C. Motor Speed Control for Portable Instrumentation,
W74-04895 7B

A Study of the Reliability of Continuous Water Quality Monitoring,
W74-04982 5A

Regression Techniques for Estimation of Sulfate in Streams Draining an Area Affected by Coal Mining,
W74-05125 5B

Environmental Activities and Programs at the Savannah River Plant.
W74-05173 5B

Fallout Program Quarterly Summary Report, (Health and Safety Laboratory, AEC, New York),
W74-05174 5A

Fallout Program Quarterly Summary Report - June 1, 1973, Through September 1, 1973, Appendix,
W74-05175 5A

Environmental Monitoring. Annual Report, 1972, (Atomics International),
W74-05177 5B

Radionuclides in Ecosystems, Volume I.
W74-05181 5B

Recent Measurements of Cesium-137 in Residence Time in Alaskan Vegetation,
W74-05188 5B

Radionuclide Biomagnification in Coastal-Plain Deer,
W74-05189 5B

Cesium-137 in White-Tailed Deer as Related to Vegetation and Soils of the Southeastern United States,
W74-05190 5B

Distribution of Cesium-137 in a Small Watershed in Northern Mississippi,
W74-05191 5B

'Barovibra' BOD Measuring Apparatus (Barovibra-BSB-Messgeraet),
W74-05265 5A

The Role of Paper Mill Additives as Potential Stream Pollutants -- Development of Nuclear Techniques,
W74-05287 5A

Pyrographic Analysis of Waste Waters,
W74-05294 5A

Minicomputers' Role in Monitoring,
W74-05297 5A

MONOGENOIDEA
Distribution and Epizootiological Importance of Dactylogyrus extensus (Monogenoidea) in Slovakia (In Czech),
W74-05358 5C

MONSOONS
Coastal Circulation Near Kakinada Bay During Monsoon Period,
W74-04941 2L

MONTANE FORESTS
The Hydrometeorological and Antierosion Effect of Forests in the Eastern Part of the Central Urals (In Russian),
W74-05353 4D

MONTE CARLO METHOD
Maximum Likelihood Estimation for Mixtures of Two Normal Distributions,
W74-04898 7C

MONTEREY BAY (CALIF)
Quasi-Weekly and Daily Profile Changes on a Distinctive Sand Beach,
W74-04964 2L

MORTADA EQUATION
Pressure Interference Effects Within Reservoirs and Aquifers,
W74-05087 4B

MOSCOW WATER SUPPLY SYSTEM
Methods of Reducing Power Consumption in Pumping Water in Water Supply Systems, Including the Use of Booster Stations,
W74-05093 8C

MOVEMENT
The Aidjex Lead Experiment,
W74-05158 2C

MUNICIPAL WASTES
Ocean Dumping in the New York Bight: An Assessment of Environmental Studies,
W74-04863 5C

MUNICIPAL WATER
Hydraulics of Water Distribution Systems,
W74-05007 5F

NAPHTHO QUINONE DERIVATIVES
Preliminary Laboratory Tests for the Control of Algae in Rice Fields (In Italian),
W74-05357 5C

NARRAGANSETT BAY (R
Lipopolysaccharide from a Gram-Negative Marine Bacterium,
W74-04896 5A

NATIONAL ENVIRONMENTAL POLICY ACT
AEC Implementation of the National Environmental Policy Act in Its Licensing and Regulation of Nuclear Facilities,
W74-05186 5G

NATIONAL INCOME
Economic Aspects of a Nuclear Desalination Agro-Industrial Project in the United Arab Republic,
W74-05382 3A

NATO
Man's Environment and the Atlantic Alliance,
W74-05027 6G

NATURAL GAS
Environmental Aspects of Natural Gas Stimulation Experiments with Nuclear Devices,
W74-05184 5B

NATURAL RESOURCES
Problems of the Conservation of Freshwater Ecosystems,
W74-05057 5C

NATURE CONSERVANCY (SCOTLAND)
Problems of the Conservation of Freshwater Ecosystems,
W74-05057 5C

NEARSHORE PROCESSES
Nearshore Processes,
W74-04932 2L

NEBRASKA
The Application of Binary Tree Structures to Hydrologic Network Simulators,
W74-04852 4A

NEMATODA
On the Problem of Host Specificity, Reservoir Parasitism and Secondary Invasions of Camallanus lacustris (Nematoda:Camallanidae), (In Czech),
W74-05359 5C

NEMATODES
Philometra nodulosa in Wyoming White Suckers,
W74-05329 5C

NETHERLANDS (IJSSELMEER POLDERS)
Agricultural Aspects,
W74-05002 4A

Recreation in the Open Air,
W74-05003 6B

NETHERLANDS (ZUIDERZEE)
Water Management,
W74-05000 4A

The Zuiderzee Works Within the Frame of Physical Planning,
W74-05001 4A

NETWORKS
The Application of Binary Tree Structures to Hydrologic Network Simulators,
W74-04852 4A

Equivalent Pipe Methods for Optimizing Water Networks--Facts and Fallacies,
W74-05383 8A

Modeling of Wastewater Disposal Systems,
W74-05388 5D

NEUTRALIZATION
Removal of Heavy Metals from Mine Drainage by Precipitation,
W74-04851 5D

NEUTRON ACTIVATION ANALYSIS
The Role of Paper Mill Additives as Potential Stream Pollutants -- Development of Nuclear Techniques,
W74-05287 5A

NEW JERSEY
Diffusion Experiments in Coastal Waters Using Dye Techniques,
W74-04938 2L

NEW MEXICO
An Analysis of Mercurials in the Elephant Butte Ecosystem,
W74-04859 5B

Altitudinal Variation of Chlorophyll Concentration and Reflectance of the Bark of Populus tremuloides,
W74-04977 2I

The Relationship of Soil Temperature and Cytokinin Production in Aspen Invasion,
W74-04978 2I

Some Aspects of the Role of Usnic Acid in Forest Ecology,
W74-04979 5B

NEW YORK
Near-Surface Oceanic Diffusion from a Continuous Point Source,
W74-04937 2L

What Future for Niagara Falls,
W74-05135 2J

Development of Water Facilities--Broome County, 1967-2017.
W74-05232 6B

Sewerage Feasibility Study, Broome County, New York, Summary, Conclusions and Recommendations.
W74-05233 5D

Riverbanks Improvement Program,
W74-05234 6F

Agricultural Pollution Control and Enforcement in New York State,
W74-05285 5B

NEW YORK BIGHT
Ocean Dumping in the New York Bight: An Assessment of Environmental Studies,
W74-04863 5C

NIAGARA FALLS
What Future for Niagara Falls,
W74-05135 2J

NIAGARA RIVER
What Future for Niagara Falls,
W74-05135 2J

NICKEL
Effects of Surfactants on Atomic Absorption Analysis of Dilute Aqueous Copper and Nickel Solutions,
W74-05313 5A

NIGERIA (SAMARU)
Effect of an Exceptional Storm on Soil Conservation at Samaru, Nigeria,
W74-05340 2J

NILE RIVER VALLEY PLAN
Planning for the Ultimate Hydraulic Development of the Nile Valley,
W74-04997 4A

NITELLA
The Characeae of Southeastern United States,
W74-04879 5A

NITRATES
Nutrients from Tile Drainage Systems, Bio-Engineering Aspects of Agricultural Drainage, San Joaquin Valley, California.
W74-05229 5B

NITRILES
Identification of Aromatic Nitriles by Reaction Paper Chromatography,
W74-04865 5A

NITRITES
Analysis of Primary Aromatic Amines and Nitrite by Diazotization and Pyrolysis Gas Chromatography,
W74-05315 5A

NITROGEN
Chlorophyll, Nitrogen, and Photsynthetic Patterns During Growth and Senescence of Two Blue-Green Algae,
W74-04884 5C

Soil Respiration, Nitrogen Mineralization and Humus Decomposition of East African Soils after Drying and Remoistening (In German),
W74-05054 2G

The Influence of Precipitation and Altitude on the Humus Content of East African Soils (In German),
W74-05058 2G

Photosynthetic Rates in Relation to Nitrogen Recycling as an Adaptation to Nutrient Deficiency in Peat Bog Plants,
W74-05065 5C

Effect of Green Fertilizer on Grape Yield,
W74-05346 5B

NITROGEN COMPOUNDS
Slow Releasing Nitrogen Fertilizer from the Waste Product, Lignin Sulphonates,
W74-05249 5B

NITROGEN FIXATION
Acetylene-Reduction Assay of Anaerobic Nitrogen Fixation by Sediments of Selected Wisconsin Lakes,
W74-05400 5B

NITROGEN REMOVAL
Removal of Nitrogen from Tile Drainage-A Summary Report, Bio-Engineering Aspects of Agricultural Drainage, San Joaquin Valley, California.
W74-05228 5D

NOMOGRAMS
Workbook of Thermal Plume Prediction: Volume 1, Submerged Discharge,
W74-05111 5B

NONLINEAR PROGRAMMING
Application of Multigoal Water Quality Planning Model,
W74-05384 5D

NORTH ANNA RIVER (VA
Some Ecological Considerations in Locating a Nuclear-Powered Electrical Generating Facility on the North Anna River, Virginia,
W74-05212 5C

NORTH CAROLINA
Public Water Supplies of North Carolina: Part 2. Southern Piedmont,
W74-04915 6D

CERC Bulletin and Summary Report of Research Progress for Fiscal Years 1965-66.
W74-04926 2L

Longshore Currents at Nags Head, North Carolina,
W74-04928 2L

North Carolina Water Plan-Progress Report-Chapter 22, Water Based Recreation.
W74-04990 6B

Flood Plain Information: Big Buffalo Creek-Little Buffalo Creek--City of Sanford, North Carolina.
W74-04993 4A

Flood Plain Information; Roanoke River-Chocoyotte Creek; City of Roanoke Rapids and Town of Weldon, North Carolina.
W74-04994 4A

Phosphates in Sediments of Pamlico Estuary,
W74-05296 5A

NORTH SLOPE (ALAS)
North Slope - Construction Criteria for Roads and Facilities,
W74-05104 4A

NORWAY
Low pH Levels Wipe Out Salmon and Trout Populations in Southernmost Norway,
W74-05356 5C

NUCLEAR EXPLOSIONS
Environmental Monitoring. Annual Report, 1972, (Atomics International),
W74-05177 5B

Environmental Aspects of Natural Gas Stimulation Experiments with Nuclear Devices,
W74-05184 5B

NUCLEAR POWERPLANTS
Environmental Activities and Programs at the Savannah River Plant.
W74-05173 5B

Radiological Evaluations for Advanced Waste Management Studies,
W74-05176 5B

General Environmental Siting Guides for Nuclear Power Plants -- Topics and Bases, (Draft).
W74-05180 5G

Radionuclides in the Environment at Nuclear Power Stations,
W74-05183 5B

The Year 2000 -- Nuclear Power and Man,
W74-05185 5B

NUMERICAL ANALYSIS
Identification of Bacteria by Computer: General Aspects and Perspectives,
W74-04909 5A

Identification of Bacteria by Computer: Identification of Reference Strains,
W74-04910 5A

Numerical Marching Techniques for Fluid Flows with Heat Transfer,
W74-05128 8B

On the Position of Tidal Barriers in Northumberland Strait,
W74-05140 2E

Numerical and Analytical Solutions of Dispersion in a Finite, Adsorbing Porous Medium,
W74-05334 5B

Extensive Pumping from Unconfined Aquifers,
W74-05336 4B

NUTRIENT VARIABILITY
Nutrients from Tile Drainage Systems, Bio-Engineering Aspects of Agricultural Drainage, San Joaquin Valley, California.
W74-05229 5B

NUTRIENTS
Thermal Effects on Biological Production in a Pond,
W74-04861 5C

The Use of Mineral Fertilizers in Irrigation with Pure Water, Sewage and Liquid Manure, (In Russian),
W74-05371 3F

OAHU (HAWAII)
Eolian Origin of Mica in Hawaiian Soils,
W74-05136 2G

OCEAN CURRENTS
Coastal Processes,
W74-04951 2L

Subsurface Eddies in the Arctic Ocean,
W74-05159 2C

OCEANOGRAPHY
Development and Flight Test of the Multichannel Ocean Color Sensor (MOCS),
W74-05026 7B

Seasonal Variability of Water Temperature in the Vicinity of the Japan Current (Vnutrisezonnaya izmenchivost' temperatury vody v rayone Kurosio),
W74-05150 2E

OIL INDUSTRY
Report of the Pollution Commission, Part II: Collaboration Between the Water and Oil Industries,
W74-05094 5B

OIL POLLUTION
Paraffin Hydrocarbon Patterns in Petroleum-Polluted Mussels,
W74-05326 5A

OIL RECOVERY SYSTEM
Oil Recovery System Using Sorbent Material,
W74-04985 5G

OIL RESERVOIRS
The Interpretation of Interference Tests in Naturally Fractured Reservoirs with Uniform Fracture Distribution,
W74-05086 8G

OIL SPILLS
Report on the Composition of Oil from the Region of New Hydrocarbon Upwelling in the Santa Barbara Channel,
W74-04919 5A

Oil Recovery System Using Sorbent Material,
W74-04985 5G

Man's Environment and the Atlantic Alliance,
W74-05027 6G

Report of the Pollution Commission, Part II: Collaboration Between the Water and Oil Industries,
W74-05094 5B

Microbial Degradation of Petroleum in Continental Shelf Sediments,
W74-05153 5B

OIL WASTES
Effect of Watershed Area Oil Fields on Water Quality,
W74-05079 5B

OILY WATER
New Measuring Methods for Evaluating Waste Water Quality (Neuere Messverfahren zur Beurteilung der Abwasserqualitaet),
W74-05259 5A

OKLAHOMA
Effect of Two Impoundments on the Salinity and Quantity of Stored Waters,
W74-05335 5B

OLIGOCHAETES
Bottom Fauna of Golcuk Lake. 1. Population Study of Chironomids, Chaoborus and Oligochaeta,
W74-05044 5C

ON-SITE LABORATORIES
Santa Rita Experimental Range: Your Facility for Research on Semidesert Ecosystems,
W74-05227 3F

ON-SITE TESTS
Spatial Variability of the Productivity: Biomass Ratio for Phytoplankton in a Small Marine Basin,
W74-05316 5C

OOSTELIJK FLEVOLAND (NETH)
Recreation in the Open Air,
W74-05003 6B

OPERATIONS RESEARCH
Systems Analysis: A Decision-making Tool for Arid Land Development,
W74-05223 6A

OPTIMIZATION
Systematic Design of Legal Regulations for Optimal Surface-Groundwater Usage--Phase 1,
W74-04853 4B

Optimization of Operation of a System of Flood Control Reservoirs,
W74-04858 4A

Acquisition and Analysis of Data for Optimized Drilling,
W74-05099 8B

Optimal State Analysis of Reservoirs,
W74-05167 6A

A Mathematical Model for Optimizing the Design of Reverse Osmosis Systems,
W74-05276 5D

Reliability and Economic Optimization for Urban Return Flows Management,
W74-05333 5B

Models of Water Supply Systems,
W74-05394 4A

OPTIMUM DEVELOPMENT PLANS
The Zuiderzee Works Within the Frame of Physical Planning,
W74-05001 4A

OREGON
Sea Surface Temperature and Salinity Conditions in 1969 at Agate Beach and Yaquina Bay, Oregon,
W74-04935 2L

Combined Mill Effluent Goes to Aeration Pond in PE (Polyethylene) Pipeline.
W74-05269 5D

ORGANIC ACIDS
Identification of Aromatic Nitriles by Reaction Paper Chromatography,
W74-04865 5A

Ascorbic Acid and Heterocyst Development in the Blue-Green Alga Anabaena Ambigua,
W74-05052 5C

ORGANIC COMPOUNDS
Trace Soluable Organic Compounds in Potable Water Supplies,
W74-04855 5A

Characteristics of Organic-Matter Distribution in Calcareous Sediments of the Caspian Sea and in Mesozoic Carbonate Rocks of the Southeastern Caucasus (Osobennosti raspredeleniya organicheskogo veshchestva v izvestkovykh osadkakh Kaspiyskogo morya i karbonatnykh porodakh mezozoya yugovostochnogo Kavkaza),
W74-05021 5B

Spectrophotometric Determination of Low Levels of Mono-, Di-, and Triethylene Glycols in Surface Waters,
W74-05290 5A

ORGANIC MATTER
Characteristics of Organic-Matter Distribution in Calcareous Sediments of the Caspian Sea and in Mesozoic Carbonate Rocks of the Southeastern Caucasus (Osobennosti raspredeleniya organicheskogo veshchestva v izvestkovykh osadkakh Kaspiyskogo morya i karbonatnykh porodakh mezozoya yugovostochnogo Kavkaza),
W74-05021 5B

Influence of Parent Material and Slope Exposure on Properties of Soils Related to Erodibility in North Central Anatolia,
W74-05066 2J

Content and Composition of Organic Matter in Sod Podzolic and Sod Sandy Soils of Different Degrees of Wetting, (In Russian),
W74-05237 2G

Problems of the Organic Matter of Organogenic Soils, (In Russian),
W74-05279 2G

ORGANIC PESTICIDES
Effect of Organic Insecticides upon Carbon-14 Uptake by Freshwater Phytoplankton,
W74-05211 5C

ORGANIC WASTES
Biological and Nonbiological Processes for Removing Dissolved Organic Substances from Residual Waste Waters (Biologische und nichtbiologische Verfahren zur Entfernung geloester organischer Substanzen aus Restabwaessern),
W74-05262 5D

ORGANOGENIC SOILS
Problems of the Organic Matter of Organogenic Soils, (In Russian),
W74-05279 2G

OROGRAPHY
Lake Michigan Snow Squalls Increase Annual Precipitation in the Udell Hills,
W74-05124 2B

ORTHOPHOSPHATE
Nutrient Studies in Hyperfertilized Estuarine Ecosystems. I. Phosphorus Studies,
W74-05061 5C

OVERFLOW
Flood Plain Information: Big Buffalo Creek-Little Buffalo Creek--City of Sanford, North Carolina.
W74-04993 4A

OXIDATION
Air Flotation-Biological Oxidation of Synthetic Rubber and Latex Waste-Water,
W74-05105 5D

Waste Water Treatment: Using Pure Oxygen for Secondary Treatment,
W74-05247 5D

Radiation Oxidation of Water Admixtures in Water-Containing Human Wastes (In Russian),
W74-05252 5D

OXIDATION-REDUCTION
Dissolved Oxygen and Iron in Shallow Wells at Salisbury, Md.,
W74-05078 5B

OXYCHLORDANE
Oxychlordane Residues in Human Adipose Tissue,
W74-04872 5A

OXYDATION LAGOONS
Ecology of Daphnia in Stabilization Ponds,
W74-05048 5D

OXYGEN
Waste Water Treatment: Using Pure Oxygen for Secondary Treatment,
W74-05247 5D

Mathematical Model for Oxygen Balance in Rivers,
W74-05392 5B

OXYGEN CONSUMPTION
Respiration of a Sublittoral Community,
W74-04874 5B

)XYGEN DEMAND
New Measuring Methods for Evaluating Waste Water Quality (Neuere Messverfahren zur Beurteilung der Abwasserqualitaet),
W74-05259 5A

)YSTERS
Tidal Stream Development and Its Effect on the Distribution of the American Oyster,
W74-04878 5C

Effects of Red Mud on Marine Animals,
W74-05325 5C

'ACIFIC OCEAN
Seasonal Variability of Water Temperature in the Vicinity of the Japan Current (Vnutrisezonnaya izmenchivost' temperatury vody v rayone Kurosio),
W74-05150 2E

'AMLICO ESTUARY (N
Phosphates in Sediments of Pamlico Estuary,
W74-05296 5A

'APER CHROMATOGRAPHY
Identification of Aromatic Nitriles by Reaction Paper Chromatography,
W74-04865 5A

PAPUA NEW GUINEA
Groundwater in Papua New Guinea,
W74-05084 4B

PARAFFINS
Paraffin Hydrocarbon Patterns in Petroleum-Polluted Mussels,
W74-05326 5A

PARASITISM
The Ultrastructure of an Alloparasitic Red Alga Choreocolax Polysiphoniae,
W74-05299 5C

PARATHION
Degradation of Parathion by Bacteria Isolated from Flooded Soil,
W74-04889 5B

PARR
Ultimate Upper Lethal Temperature of Atlantic Salmon Salmo salar L.,
W74-04869 5C

PARTICLE SIZE
PCB Residues in Plankton from the Gulf of St. Lawrence,
W74-05256 5A

PATH OF POLLUTANTS
Degradation of Parathion by Bacteria Isolated from Flooded Soil,
W74-04889 5B

Currents Around the Hawaiian Islands. A Study of Coastal Currents in Respect to Sewage Disposal,
W74-04925 5B

On the Measurement of Turbulence in Estuaries,
W74-04933 5B

Application of Boundary-Layer Theory to Dispersion in Nonstratified Two-Dimensional Estuaries,
W74-04983 2L

Migration of Elements in River Waters (Migratsiya elementov v rechnykh vodakh),
W74-05022 5B

Microbial Degradation of Petroleum in Continental Shelf Sediments,
W74-05153 5B

Radionuclides in Ecosystems, Volume I.
W74-05181 5B

Radionuclides in the Environment at Nuclear Power Stations,
W74-05183 5B

The Year 2000 -- Nuclear Power and Man,
W74-05185 5B

Recent Measurements of Cesium-137 in Residence Time in Alaskan Vegetation,
W74-05188 5B

A Proposed Mechanism for the Recycling of Radiocesium in Florida Soil Plant Systems,
W74-05192 5A

Cesium-137 Soil Inventory of a Tagged Liriodendron Forest 1962 and 1969,
W74-05193 5B

Cycling of Stable Cesium in a Desert Ecoystem,
W74-05195 5B

Tritium Movement in an Old-Field Ecosystem Determined Experimentally,
W74-05198 5B

Numerical and Analytical Solutions of Dispersion in a Finite, Adsorbing Porous Medium,
W74-05334 5B

PATHOGENIC BACTERIA
Recovery and Identification of Anaerobes: A System Suitable for the Routine Clinical Laboratory,
W74-04886 5A

PEAK DISCHARGE
Flood Plain Information: Big Buffalo Creek-Little Buffalo Creek--City of Sanford, North Carolina.
W74-04993 4A

PEAT BOG
An Example of Longevity of Pine on a Peat Bog, (In Russian),
W74-05351 2I

PEAT BOGS
Problems of the Organic Matter of Organogenic Soils, (In Russian),
W74-05279 2G

PENICILLIUM
An Appraisal of Identification Methods for Penicillium Species: Novel Taxonomic Criteria Based on Temperature and Water Relations,
W74-04902 5A

PENNSYLVANIA
Survival of Brook Trout in a Bog-Derived Acidity Gradient,
W74-04873 5C

Soil as a Medium for the Renovation of Acid Mine Drainage Water,
W74-04981 5D

Abatement of Mine Drainage Pollution by Underground Precipitation,
W74-05106 5G

Pan and Lake Evaporation in Pennsylvania,
W74-05121 2D

PERCH
On the Problem of Host Specificity, Reservoir Parasitism and Secondary Invasions of Camallanus lacustris (Nematoda:Camallanidae), (In Czech),
W74-05359 5C

PERCOLATING WATER
Reasonable State Regulation of the Interstate Transfer of Percolating Water,
W74-04980 4A

PERIPHYTON
Primary Production of the Periphyton in the Littoral of the Danube,
W74-04876 5C

PERMAFROST
An Investigation of Core Drilling in Perennially Frozen Gravels and Rock,
W74-05170 2C

PERMEABILITY
The Skin Effect in Producing Wells,
W74-05088 8B

Wellbore Transmissibility from Afterflow-Dominated Pressure Buildup Data,
W74-05101 8G

PESTICIDE KINETICS
Atrazine, Propachlor, and Diazinon Residues on Small Agricultural Watersheds,
W74-05295 5B

PESTICIDE RESIDUES
Oxychlordane Residues in Human Adipose Tissue,
W74-04872 5A

Atrazine, Propachlor, and Diazinon Residues on Small Agricultural Watersheds,
W74-05295 5B

Polychlorinated Biphenyls in the Seastar Acanthaster Planci,
W74-05301 5A

PESTICIDES
Agricultural Pollution Control and Enforcement in New York State,
W74-05285 5B

Wood Waste Reuse in Controlled Release Pesticides,
W74-05286 5D

PETROLEUM HYDROCARBONS
Paraffin Hydrocarbon Patterns in Petroleum-Polluted Mussels,
W74-05326 5A

PETUNIA PLANTS
Effect of Trace Elements on the Water Regimen, the Decorative Qualities and the Seed Yield of Some Ornamental Plants, (In Russian),
W74-05345 5C

PHENOLS
New Ultraviolet Ratio Spectrophotometric System for the Determination of Trace Amounts of Phenolic Compounds,
W74-05244 5A

PHOSPHATES
Nutrients from Tile Drainage Systems, Bio-Engineering Aspects of Agricultural Drainage, San Joaquin Valley, California.
W74-05229 5B

Phosphates in Sediments of Pamlico Estuary,
W74-05296 5A

PHOSPHATES

Agrochemical Properties and Forms of Phosphates in Typical Sierozems Irrigated at Various Times, (In Russian),
W74-05377 3F

PHOSPHORUS

Biological Response to Detergent and Nondetergent Phosphorus in Sewage - Part I,
W74-04901 5C

Characteristics of Phosphorus Deficiency in Anabaena,
W74-04905 5C

Nutrient Studies in Hyperfertilized Estuarine Ecosystems. I. Phosphorus Studies,
W74-05061 5C

Relationships Between Phosphorus-32 Accumulation in Algae, Bacteria, and Tubificids,
W74-05206 5C

Uptake of Radiophosphorus by Rooted Aquatic Plants,
W74-05207 5C

Phosphates in Sediments of Pamlico Estuary,
W74-05296 5A

The Use of Mineral Fertilizers in Irrigation with Pure Water, Sewage and Liquid Manure, (In Russian),
W74-05371 3F

Efficacy of Large Doses of Mineral Fertilizers in Irrigated Soils, (In Russian),
W74-05379 3F

PHOSPHOTHIOATE PESTICIDES

Atrazine, Propachlor, and Diazinon Residues on Small Agricultural Watersheds,
W74-05295 5B

PHOTOPHOSPHORYLATION

Bioenergetics of the Assimilating Cells of Chlorella Pyrenoidosa Chick. II. Relation of Cyclic and Non-Cyclic Photophosphorylation to Photosynthetic CO2 Fixation,
W74-05059 5C

PHOTOSYNTHESIS

Primary Production of the Periphyton in the Littoral of the Danube,
W74-04876 5C

Chlorophyll, Nitrogen, and Photsynthetic Patterns During Growth and Senescence of Two Blue-Green Algae,
W74-04884 5C

Altitudinal Variation of Chlorophyll Concentration and Reflectance of the Bark of Populus tremuloides,
W74-04977 2I

Factors Affecting the Photosynthetic Capacity of Laboratory Cultures of the Diatom Phaeodactylum Tricornutum,
W74-05046 5C

Bioenergetics of the Assimilating Cells of Chlorella Pyrenoidosa Chick. II. Relation of Cyclic and Non-Cyclic Photophosphorylation to Photosynthetic CO2 Fixation,
W74-05059 5C

Research on Red Algal Pigments. 5. The Effect of the Intensity of White and Green Light on the Rate of Photosynthesis and its Relationship to Pigment Components in Gracilaria Compressa (C. AG.) Grev. (Rhodophyceae, Gigartinales),
W74-05300 5C

PHYSICAL PROPERTIES

Hydrobiological Studies 2.
W74-05068 5C

PHYSICOCHEMICAL PROPERTIES

Limnological Survey of Lakes Michigan, Superior, Huron and Erie,
W74-05067 5C

PHYSICOCHEMICAL STUDIES

Comparative Study of the Physicochemical Properties of Meliorated and Non-Meliorated Soils at the Mugan Experimental Melioration Station, (In Russian),
W74-05037 2G

PHYSIOECOLOGY

Physioecology of the Umsindusi River within the Pietermaritzburg City Limits,
W74-05363 5B

PHYTOMASS RESERVES (TREES)

Phytomass Reserves in Some Types of Tundra from the Northern Ob River Related Area, (In Russian),
W74-04940 2I

PHYTOPLANKTON

Effect of Organic Insecticides upon Carbon-14 Uptake by Freshwater Phytoplankton,
W74-05211 5C

Spatial Variability of the Productivity: Biomass Ratio for Phytoplankton in a Small Marine Basin,
W74-05316 5C

PIKE-PERCH

Combined Rearing of the Pike-Perch Lucioperca lucioperca (L.) and Roach Rutilus rutilus Heckeli (Nordm.) in Liman Fish Farms of Kuban, (In Russian),
W74-04923 8I

PINE FORESTS

The Problem of the Microclimate of the Dry Pine Forest, (In Russian),
W74-05350 2I

PINE LONGEVITY

An Example of Longevity of Pine on a Peat Bog, (In Russian),
W74-05351 2I

PINES

Dense Local Plantations of Pines in the Northern Kazakhstan (In Russian),
W74-05354 4A

PIPE FLOW

Development of a Meter for Measurement of Sewer Flow,
W74-04857 8B

PIPE MATERIALS

Proceedings of Fourth Sanitary Engineering Conference on Water Distribution Systems.
W74-05006 5F

PIPELINES

Pipe Materials, Coatings, and Joints for Water Distribution Systems,
W74-05009 5F

Water Main Laying,
W74-05010 5F

Tapping, Disinfection, and Inspection of Water Mains,
W74-05011 5F

Observing Fire Protection Requirements in Future Water System Design,
W74-05012 5F

Corrosion Control Speeds Up,
W74-05090 8G

Combined Mill Effluent Goes to Aeration Pond in PE (Polyethylene) Pipeline.
W74-05269 5D

PIPES

Pipe Materials, Coatings, and Joints for Water Distribution Systems,
W74-05009 5F

Water Main Laying,
W74-05010 5F

Tapping, Disinfection, and Inspection of Water Mains,
W74-05011 5F

Observing Fire Protection Requirements in Future Water System Design,
W74-05012 5F

Maintenance of Water Distribution Systems,
W74-05013 5F

Equivalent Pipe Methods for Optimizing Water Networks--Facts and Fallacies,
W74-05383 8A

PITTING

Unusual Cases of Copper Corrosion,
W74-05097 8G

PLANKTON

Field Experiment on the Factors Controlling Primary Production of the Lake Plankton and Periphyton,
W74-05056 5C

The Changes in Several Parameters of Plankton Primary Productivity in Slapy Reservoir 1960-1967, Their Mutual Correlations and Correlations with the Main Ecological Factors,
W74-05071 5C

PCB Residues in Plankton from the Gulf of St Lawrence,
W74-05256 5A

PLANNING

Aesthetics in Environmental Planning.
W74-04987 6C

A Treatise on Centralized Management of Water Resources,
W74-05030 6E

The Challenge of Environmental Protection and Industrial Development,
W74-05083 6C

Interstate Planning for Regional Water Supply and Pollution Control.
W74-05108 5I

Regional Water and Sewer Plan, The Mid-Missouri Region.
W74-05238 5I

Saginaw County Water and Wastewater Utility Master Plan.
W74-05243 5I

Introduction to Simulation Techniques,
W74-05391 5C

PLANT GROWTH
Thermal Effects on Biological Production in a Pond,
W74-04861 5C

Chlorophyll, Nitrogen, and Photsynthetic Patterns During Growth and Senescence of Two Blue-Green Algae,
W74-04884 5C

Cotton: A Computer Simulation of Cotton Growth,
W74-05213 3F

PLANT PIGMENTS
Research on Red Algal Pigments. 5. The Effect of the Intensity of White and Green Light on the Rate of Photosynthesis and its Relationship to Pigment Components in Gracilaria Compressa (C. AG.) Grev. (Rhodophyceae, Gigartinales),
W74-05300 5C

PLANTS
Photosynthetic Rates in Relation to Nitrogen Recycling as an Adaptation to Nutrient Deficiency in Peat Bog Plants,
W74-05065 5C

PLASTIC DEFORMATION
A Relation Between the Potential Energy Produced by Ridging and the Mechanical Work Required to Deform Pack Ice,
W74-05160 2C

Redistribution Functions and Their Yield Surfaces in a Plastic Theory of Pack Ice Deformation,
W74-05161 2C

Dimensionless Strength Parameters for Floating Ice Sheets,
W74-05162 2C

A Mechanical Model of Rafting,
W74-05163 2C

Classification and Variation of Sea Ice Ridging in the Arctic Basin,
W74-05165 2C

PLASTICS
Combined Mill Effluent Goes to Aeration Pond in PE (Polyethylene) Pipeline.
W74-05269 5D

Settling Plates of Cold-Cure Acrylic Plastic Replicated from Natural Surfaces,
W74-05319 5A

PLUTONIUM
Fallout Program Quarterly Summary Report, (Health and Safety Laboratory, AEC, New York),
W74-05174 5A

Fallout Program Quarterly Summary Report - June 1, 1973, Through September 1, 1973, Appendix,
W74-05175 5A

PODZOLIC SOIL
Content and Composition of Organic Matter in Sod Podzolic and Sod Sandy Soils of Different Degrees of Wetting, (In Russian),
W74-05237 2G

PODZOLIC SOILS
Moisture and Temperature Regimes in the Southern-Taiga Soils of Central Siberia and Habitat Conditions for Crops, (In Russian),
W74-05373 3F

POLAND
Purification of Bleached Kraft Mill Effluents by Activated Sludge Treatment (Oczyszczanie metoda osadu czynnego sciekow z produkcji masy celulozowej siarczanowej bielonej),
W74-05267 5D

POLITICAL ASPECTS
Urban Water Resources--Politics of Management,
W74-05235 6E

Water Resources Management,
W74-05396 6B

POLLUTANT IDENTIFICATION
Identification of Aromatic Nitriles by Reaction Paper Chromatography,
W74-04865 5A

Coulometric Determination of Iron(II)-1,10-Phenanthroline with Cerium(IV),
W74-04867 5A

Confirmation of Hexachlorobenzene by Chemical Reaction,
W74-04871 5A

Oxychlordane Residues in Human Adipose Tissue,
W74-04872 5A

Scanning Electron Microscopy of Bacterial Colonies,
W74-04885 5A

Recovery and Identification of Anaerobes: A System Suitable for the Routine Clinical Laboratory,
W74-04886 5A

Method for Radiorespirometric Detection of Bacteria in Pure Culture and in Blood,
W74-04887 5A

Urease Activity of Enterobacteriaceae: Which Medium to Choose,
W74-04888 5A

Composition and Waste Load of Unit Effluents from a Commercial Leafy Greens Canning Operation,
W74-04904 5A

Multipurpose Medium for Use with Pseudomonas Species,
W74-04906 5A

Isolation and Characterization of a Thermotolerant Methanol-Utilizing Yeast,
W74-04907 5A

Identification of Bacteria by Computer: Identification of Reference Strains,
W74-04910 5A

Report on the Composition of Oil from the Region of New Hydrocarbon Upwelling in the Santa Barbara Channel,
W74-04919 5A

Fluorimetric Method for the Determination of Uranium in Natural Waters,
W74-05240 5A

New Ultraviolet Ratio Spectrophotometric System for the Determination of Trace Amounts of Phenolic Compounds,
W74-05244 5A

PCB Residues in Plankton from the Gulf of St. Lawrence,
W74-05256 5A

New Measuring Methods for Evaluating Waste Water Quality (Neuere Messverfahren zur Beurteilung der Abwasserqualitaet),
W74-05259 5A

'Barovibra' BOD Measuring Apparatus (Barovibra-BSB-Messgeraet),
W74-05265 5A

Isolation and Chemical Identification of Toxic Components of Kraft Mill Wastes,
W74-05270 5A

Spectrophotometric Determination of Low Levels of Mono-, Di-, and Triethylene Glycols in Surface Waters,
W74-05290 5A

Anodic Stripping Voltammetry of Zinc in Seawater with a Tubular Mercury-Graphite Electrode,
W74-05305 5A

Preservation of Dilute Mercury Solutions,
W74-05310 5A

Determination of Trace Amounts of C2-C5 Acids in Aqueous Solutions by Gas Chromatography,
W74-05314 5A

Fish Viruses: Isolation and Identification of Infectious Hematopoietic Necrosis in Eastern North America,
W74-05322 5A

Microcultures of Brown Bullhead (Ictalurus nebulosus) Cells: Their Use in Quantitation of Channel Catfish (Ictalurus punctatus) Virus and Antibody,
W74-05323 5A

Paraffin Hydrocarbon Patterns in Petroleum-Polluted Mussels,
W74-05326 5A

POLLUTION ABATEMENT
Oil Recovery System Using Sorbent Material,
W74-04985 5G

A Bibliography on Legal and Regulatory Aspects of Water Pollution Control and Abatement, Part I: Abstracts.
W74-05004 5G

A Bibliography on Legal and Regulatory Aspects of Water Pollution Control and Abatement, Part II: Subject Index.
W74-05005 5G

Interstate Planning for Regional Water Supply and Pollution Control.
W74-05108 5D

Regional Environmental Pollution Study: Inventory and Analysis.
W74-05239 5B

A Starch-Free Effluent Program for Corrugating Plants,
W74-05250 5B

Effluent -- Fibre Recovery -- Water Savings: A Method to Analyse and Tackle the Problems,
W74-05257 5D

Survey of Residual Waste Water Treatment (Ueberblick ueber die Behandlung der Restabwaesser),
W74-05261 5D

How Much Will Cleanup Cost,
W74-05268 5D

Pollution -- Yesterday, Today, and Tomorrow,
W74-05272 5D

Measures Against Water Pollution in Mechanical Pulp and Paper Mills,
W74-05273 5D

Economic Impact of Pollution Abatement on the Sulfite Segment of the U.S. Pulp and Paper Industry,
W74-05277 5D

Characterization of Sulfite Pulping Effluents and Available Alternative Treatment Methods,
W74-05278 5D

Agricultural Pollution Control and Enforcement in New York State,
W74-05285 5B

A Pulp and Paper Mill with Fully Closed Recirculation System -- Utopia or Realistic Possibility. (Eine Zellstoff-und Papierfabrik mit vollstaendig geschlossenem Kreislauf -- eine Utopie oder eine realistische Moeglichkeit),
W74-05289 5D

Models for Environmental Pollution Control.
W74-05386 5B

Systems Analysis for Environmental Pollution Control,
W74-05387 5G

POLYCHLORINATED BIPHENYLS
PCB Residues in Plankton from the Gulf of St. Lawrence,
W74-05256 5A

Polychlorinated Biphenyls in the Seastar Acanthaster Planci,
W74-05301 5A

POPULUS TREMULOIDES
Altitudinal Variation of Chlorophyll Concentration and Reflectance of the Bark of Populus tremuloides,
W74-04977 2I

POROSITY
The Effect of Different Tillage Methods on the Physical Properties of Soil, (In Russian),
W74-05378 2G

POROUS MEDIA
Numerical and Analytical Solutions of Dispersion in a Finite, Adsorbing Porous Medium,
W74-05334 5B

POST-IMPOUNDMENT
The Human Ecological Impact of Structural Flood Control on the Iowa River, Iowa,
W74-04856 8A

POTABLE WATER
Trace Soluable Organic Compounds in Potable Water Supplies,
W74-04855 5A

POTASSIUM
Cycling of Stable Cesium in a Desert Ecoystem,
W74-05195 5B

Efficacy of Large Doses of Mineral Fertilizers in Irrigated Soils, (In Russian),
W74-05379 3F

POTENTIOMETERS
Potentiometer Recorders.
W74-05298 7B

POWER SOURCES
Potentials of Tidal Power on the North Atlantic Coast in Canada and United States,
W74-04972 2L

POWERPLANTS
Potentials of Tidal Power on the North Atlantic Coast in Canada and United States,
W74-04972 2L

An Evaluation of the Effects of Estuarine Engineering Projects,
W74-05038 5B

PRE-IMPOUNDMENT
Hydrologic Characteristics of Alder Creek, Iron County, Wisconsin,
W74-04920 4A

PRECIPITATION (ATMOSPHERIC)
Lake Michigan Snow Squalls Increase Annual Precipitation in the Udell Hills,
W74-05124 2B

20-24 Year Cycle in the March of Atmospheric Precipitation and Its Relation to Air Circulation Patterns (Tsikl 20-24 goda v khode atmosfernykh osadkov i yego svyza' s osobennostyami atmosfernoy tsirkulyatsii),
W74-05149 2B

PRECIPITATION GAGES
Annotated Bibliography on Precipitation Measurement Instruments,
W74-05169 2B

PRECIPITATION INTENSITY
Bomex Rainy Day Analysis,
W74-04921 2B

PREDICTION
Prediction of the Start of Erosion in the Light of Principles of Reliability Theory, (In Russian),
W74-05347 2J

PRESERVATION
Problems of the Conservation of Freshwater Ecosystems,
W74-05057 5C

PRESSURE
Pressure Interference Effects Within Reservoirs and Aquifers,
W74-05087 4B

Chart Tells Annular Circulation Pressures,
W74-05096 8B

Wellbore Transmissibility from Afterflow-Dominated Pressure Buildup Data,
W74-05101 8G

PRESSURE-DEWATERING
Borehole Sampling of Satuarated Uncemented Sands and Gravels,
W74-05081 8G

PRIMARY PRODUCTIVITY
Primary Production of the Periphyton in the Littoral of the Danube,
W74-04876 5C

Field Experiment on the Factors Controlling Primary Production of the Lake Plankton and Periphyton,
W74-05056 5C

The Changes in Several Parameters of Plankton Primary Productivity in Slapy Reservoir 1960-1967, Their Mutual Correlations and Correlations with the Main Ecological Factors,
W74-05071 5C

Spatial Variability of the Productivity: Biomass Ratio for Phytoplankton in a Small Marine Basin,
W74-05316 5C

PROBABILITY
Optimization of Operation of a System of Flood Control Reservoirs,
W74-04858 4A

Approximating Discrete Distributions, with Applications,
W74-04892 7C

Maximum Likelihood Estimation for Mixtures of Two Normal Distributions,
W74-04898 7C

PRODUCTION PERSONNEL
Selection, Handling, and Protection of Downhole Materials: A Practical Approach,
W74-05102 8G

PRODUCTIVITY
Production of a Natural Population of Bithynia Tentaculata L. (Gastropoda, Mollusca),
W74-05049 5C

PROGRAMMING LANGUAGES
Focal on the PDP-9 Computer,
W74-05151 7C

PROJECT FEASIBILITY
The Identification and Quantification of the Net Effects of Multiple-Purpose River Basin Development,
W74-04854 4A

PROJECT PLANNING
Detailed Project Report, Dyersburg, Tennessee, Finley Street Area.
W74-04989 4A

PROJECT POST-EVALUATION
Economic, Social and Environmental Impacts of Public Works, Vol. I Pittsburgh Area Studies, Vol. II. The Alegheny County Sanitary Authority (AlCoSan) Facility, Vol. III. Impact Analysis,
W74-05231 6B

Sewage Collection and Treatment Systems: Issues in and Approaches to Impact Analysis,
W74-05241 6B

PROJECTS
EXPRO '74--A Listing of Extramural Projects to be Funded in Fiscal Year 1974.
W74-04913 5G

PSEUDOMONAS
Degradation of Parathion by Bacteria Isolated from Flooded Soil,
W74-04889 5B

Multipurpose Medium for Use with Pseudomonas Species,
W74-04906 5A

PUBLIC HEALTH
The Biological Pathway of Zinc (Zn-65) in Freshwater Fish and its Alteration by Heavy Metals,
W74-05201 5C

PULP AND PAPER INDUSTRY
Effluent -- Fibre Recovery -- Water Savings: A Method to Analyse and Tackle the Problems,
W74-05257 5D

Quick Brown Fox Doesn't Trip Over Thilmany's Effluent Anymore,
W74-05258 5D

How Much Will Cleanup Cost,
W74-05268 5D

Pollution -- Yesterday, Today, and Tomorrow,
W74-05272 5D

Effluent-Free Bleached Kraft Pulp Mill: Present State of Development,
W74-05275 5D

Economic Impact of Pollution Abatement on the Sulfite Segment of the U.S. Pulp and Paper Industry,
W74-05277 5D

Closed Water Circulation System in a Paper and Paperboard Mill (Geschlossener Wasserkreislauf in einer Papier-und Kartonfabrik),
W74-05281 5D

Fundamental View of the Closed Water Circuit (Der geschlossene Wasserkreislauf in grundsaetzlicher Betrachtung),
W74-05282 5D

The Role of Paper Mill Additives as Potential Stream Pollutants -- Development of Nuclear Techniques,
W74-05287 5A

PULP WASTES

An Experimental Investigation into Effects of Pulp Mill Effluent on Structure of Biological Communities in Alberni Inlet, British Columbia. Part 1: Subtidal Communities,
W74-05047 5C

Kraft Pulping Effluent Treatment and Reuse - State of the Art,
W74-05110 5D

Treatment for Clarifying White Water Coming from a Groundwood Pulp Mill (Tratamiento para la clarificacion de agua blanca procedente de la fabricacion de pasta de madera),
W74-05245 5D

Waste Water Treatment: Using Pure Oxygen for Secondary Treatment,
W74-05247 5D

Slow Releasing Nitrogen Fertilizer from the Waste Product, Lignin Sulphonates,
W74-05249 5B

A Starch-Free Effluent Program for Corrugating Plants,
W74-05250 5B

Methanol Distribution in an Evaporation Plant,
W74-05253 5D

Effects of Waste Water Recycle in a Paperboard Mill,
W74-05254 5D

Effluent -- Fibre Recovery -- Water Savings: A Method to Analyse and Tackle the Problems,
W74-05257 5D

Quick Brown Fox Doesn't Trip Over Thilmany's Effluent Anymore,
W74-05258 5D

New Measuring Methods for Evaluating Waste Water Quality (Neuere Messverfahren zur Beurteilung der Abwasserqualitaet),
W74-05259 5A

The Purification of Residual Waste Waters of the Sulfite Pulp Industry (Die Reinigung von Restabwaessern der Sulfitzellstoff-Industrie),
W74-05260 5D

Survey of Residual Waste Water Treatment (Ueberblick ueber die Behandlung der Restabwaesser),
W74-05261 5D

Biological and Nonbiological Processes for Removing Dissolved Organic Substances from Residual Waste Waters (Biologische und nichtbiologische Verfahren zur Entfernung geloester organischer Substanzen aus Restabwaessern),
W74-05262 5D

Removal of Residual Waste Water Sludges (Beseitigung der Restabwasserschlaemme),
W74-05263 5D

Installation of Waste Water and Sludge Treatment Facilities at the Arjomari-Prioux Paper Mill at Rives-Sur-Fure (Installation de traitement des eaux residuaires et des boues de la papeterie Arjomari Prioux a Rives-sur-Fure).
W74-05264 5D

Whither Clarified Sludge. (Wohin mit dem Klaerschlamm.),
W74-05266 5E

Purification of Bleached Kraft Mill Effluents by Activated Sludge Treatment (Oczyszczanie metoda osadu czynnego sciekow z produkcji masy celulozowej siarczanowej bielonej),
W74-05267 5D

Combined Mill Effluent Goes to Aeration Pond in PE (Polyethylene) Pipeline.
W74-05269 5D

Isolation and Chemical Identification of Toxic Components of Kraft Mill Wastes,
W74-05270 5A

Measures Against Water Pollution in Mechanical Pulp and Paper Mills,
W74-05273 5D

Recycling Water -- A Simple Solution,
W74-05274 5D

Effluent-Free Bleached Kraft Pulp Mill: Present State of Development,
W74-05275 5D

A Mathematical Model for Optimizing the Design of Reverse Osmosis Systems,
W74-05276 5D

Characterization of Sulfite Pulping Effluents and Available Alternative Treatment Methods,
W74-05278 5D

Hot Problem Solved by Aerated Lagoon,
W74-05280 5D

Experiences with Chemical Pre-Purification of Kraft Mill Waste Water with Magnesium Chloride Brine (Potassium Extraction Liquor) (Erfahrungen bei der chemischen Vorreinigung von Sulfatzellstoffabwasser mit Magnesiumchloridsole (Kaliendlauge),
W74-05283 5D

Wood Waste Reuse in Controlled Release Pesticides,
W74-05286 5D

A Pulp and Paper Mill with Fully Closed Recirculation System -- Utopia or Realistic Possibility. (Eine Zellstoff-und Papierfabrik mit vollstaendig geschlossenem Kreislauf -- eine Utopie oder eine realistische Moeglichkeit),
W74-05289 5D

PULSE TEST

Pulse-Test Response of a Two-Zone Reservoir,
W74-05077 4B

How Areal Heterogeneities Affect Pulse-Test Results,
W74-05092 8G

PULSED DC SPEED CONTROL

Pulsed D.C. Motor Speed Control for Portable Instrumentation,
W74-04895 7B

PUMPED STORAGE

Methods of Reducing Power Consumption in Pumping Water in Water Supply Systems, Including the Use of Booster Stations,
W74-05093 8C

PUMPING

Methods of Reducing Power Consumption in Pumping Water in Water Supply Systems, Including the Use of Booster Stations,
W74-05093 8C

Chart Tells Annular Circulation Pressures,
W74-05096 8B

Extensive Pumping from Unconfined Aquifers,
W74-05336 4B

PUMPING TEST

Interpretation of Boundary Effects from Pumping Test Data,
W74-05089 8B

PYROGRAPHIC ANALYSIS

Pyrographic Analysis of Waste Waters,
W74-05294 5A

PYROLYSIS GAS CHROMATOGRAPHY

Analysis of Primary Aromatic Amines and Nitrite by Diazotization and Pyrolysis Gas Chromatography,
W74-05315 5A

QUALITY CONTROL

Reservoir Aeration Improves Water Quality,
W74-05063 5F

Total Environmental Quality Management Models,
W74-05398 5G

QUANTITATIVE ANALYSIS

Microcultures of Brown Bullhead (Ictalurus nebulosus) Cells: Their Use in Quantitation of Channel Catfish (Ictalurus punctatus) Virus and Antibody,
W74-05323 5A

RADIAL COLLECTOR WELLS

Design and Use of Radial Collector Wells,
W74-05098 8B

RADIATION

Environmental Monitoring. Annual Report, 1972, (Atomics International),
W74-05177 5B

Radiation Oxidation of Water Admixtures in Water-Containing Human Wastes (In Russian),
W74-05252 5D

RADIOACTIVE TRACERS

Cesium-137 Soil Inventory of a Tagged Liriodendron Forest 1962 and 1969,
W74-05193 5B

RADIOACTIVE WASTE DISPOSAL

Radiological Evaluations for Advanced Waste Management Studies,
W74-05176 5B

RADIOACTIVITY
Environmental Activities and Programs at the Savannah River Plant.
W74-05173 5B

Fallout Program Quarterly Summary Report, (Health and Safety Laboratory, AEC, New York),
W74-05174 5A

Fallout Program Quarterly Summary Report - June 1, 1973, Through September 1, 1973, Appendix,
W74-05175 5A

Low-Level Radioactivity Measurements,
W74-05178 5A

Radiological Survey of the Area Surrounding the Elk River Reactor, Elk River, Minnesota.
W74-05179 5B

An Ecological Approach to the Evaluation of Radioactivity Within the Man-Environment Ecosystem,
W74-05182 5B

Radionuclides in the Environment at Nuclear Power Stations,
W74-05183 5B

The Year 2000 -- Nuclear Power and Man,
W74-05185 5B

Gamma-Emitting Radionuclides in Alaskan Environments 1967-1970,
W74-05187 5B

Calcium Cycling: Diffusion into a Forest Soil,
W74-05200 5B

The Biological Pathway of Zinc (Zn-65) in Freshwater Fish and its Alteration by Heavy Metals,
W74-05201 5C

Strontium-90 and Cesium-137 in Water and Deep Sediments of the Great Lakes,
W74-05208 5C

RADIOACTIVITY TECHNIQUES
Method for Radiorespirometric Detection of Bacteria in Pure Culture and in Blood,
W74-04887 5A

The Role of Paper Mill Additives as Potential Stream Pollutants -- Development of Nuclear Techniques,
W74-05287 5A

RADIOECOLOGY
Radionuclides in Ecosystems, Volume I.
W74-05181 5B

Radionuclides in the Environment at Nuclear Power Stations,
W74-05183 5B

Environmental Aspects of Natural Gas Stimulation Experiments with Nuclear Devices,
W74-05184 5B

A Proposed Mechanism for the Recycling of Radiocesium in Florida Soil Plant Systems,
W74-05192 5A

Persistence of Radionuclides in Soil, Plants, and Small Mammals in Areas Contaminated with Radioactive Fallout,
W74-05194 5B

Uptake of Molybdenum Marked with Mo-99, by the Biota of Fern Lake, Washington, in a Laboratory and Field Experiment,
W74-05210 5C

RADIOISOTOPES
Radionuclides in Ecosystems, Volume I.
W74-05181 5B

Radionuclide Biomagnification in Coastal-Plain Deer,
W74-05189 5B

Persistence of Radionuclides in Soil, Plants, and Small Mammals in Areas Contaminated with Radioactive Fallout,
W74-05194 5B

Accumulation of Ce-144 by Hickory and Co-60 by Black Gum Seedlings,
W74-05196 5B

Uptake of Radiophosphorus by Rooted Aquatic Plants,
W74-05207 5C

Uptake of Molybdenum Marked with Mo-99, by the Biota of Fern Lake, Washington, in a Laboratory and Field Experiment,
W74-05210 5C

RADIOPHOSPHORUS
Uptake of Radiophosphorus by Rooted Aquatic Plants,
W74-05207 5C

RADIORESPIROMETRY
Method for Radiorespirometric Detection of Bacteria in Pure Culture and in Blood,
W74-04887 5A

RAFTING (SEA ICE)
A Mechanical Model of Rafting,
W74-05163 2C

RAIN GAGES
Annotated Bibliography on Precipitation Measurement Instruments,
W74-05169 2B

RAIN WATER
Improving Farm Production in Regions of Limited Rainfall,
W74-05224 3F

RAINBOW TROUT
Fish Viruses: Isolation and Identification of Infectious Hematopoietic Necrosis in Eastern North America,
W74-05322 5A

RAINFALL
Rainfall Intensities in Israel,
W74-05123 2B

Chemical Composition of Monsoon Rainwater Over Chandigarh in 1971,
W74-05130 2B

RAINFALL INTENSITY
Bomex Rainy Day Analysis,
W74-04921 2B

RARE-EARTH ELEMENTS
Accumulation of Ce-144 by Hickory and Co-60 by Black Gum Seedlings,
W74-05196 5B

RE-REGULATION RESERVOIRS
Limnology of Two Re-Regulation Reservoirs in Czechoslovakia,
W74-05073 5C

The Influence of Two Re-Regulation Reservoirs on the Chemical and Bacteriological Properties of River Water,
W74-05074 5C

RECHARGE
Practical Simulation Models of the Subsurface Hydrologic System with Example Applications,
W74-04973 2F

RECIRCULATED WATER
Recycling Water -- A Simple Solution,
W74-05274 5D

Closed Water Circulation System in a Paper and Paperboard Mill (Geschlossener Wasserkreislauf in einer Papier-und Kartonfabrik),
W74-05281 5D

A Pulp and Paper Mill with Fully Closed Recirculation System -- Utopia or Realistic Possibility. (Eine Zellstoff-und Papierfabrik mit vollstaendig geschlossenem Kreislauf -- eine Utopie oder eine realistische Moeglichkeit),
W74-05289 5D

RECLAMATION
Water Management,
W74-05000 4A

Agricultural Aspects,
W74-05002 4A

Recreation in the Open Air,
W74-05003 6B

RECLAMATION DIKES
Studies on Reclamation Dike at River Mouth: Method of Forecasting Disaster Occurrence at Land Reclamation by Means of Estimating Influence of Shape of Dike and Configuration Surrounding Land Reclamation Area (In Japanese),
W74-05355 4A

RECORDERS
Potentiometer Recorders.
W74-05298 7B

RECOVERY
Recovery and Identification of Anaerobes: A System Suitable for the Routine Clinical Laboratory,
W74-04886 5A

RECOVERY (MINE WASTES)
Removal of Heavy Metals from Mine Drainage by Precipitation,
W74-04851 5D

RECREATION FACILITIES
North Carolina Water Plan-Progress Report-Chapter 22, Water Based Recreation.
W74-04990 6B

Recreation in the Open Air,
W74-05003 6B

RECREATIONAL DEMAND
North Carolina Water Plan-Progress Report-Chapter 22, Water Based Recreation.
W74-04990 6B

RECREATIONAL FACILITIES
Water Quality in Alaskan Campgrounds,
W74-04974 5B

RECREATIONAL WASTES
Water Quality in Alaskan Campgrounds,
W74-04974 5B

RECYCLING
Removal of Heavy Metals from Mine Drainage by Precipitation,
W74-04851 5D

Treatment of Laundromat Wastes,
W74-05109 5D

A Proposed Mechanism for the Recycling of Radiocesium in Florida Soil Plant Systems,
W74-05192 5A

Effects of Waste Water Recycle in a Paperboard Mill,
W74-05254 5D

Water and Waste Water Problems in Modern Textile Finishing Plants (Wasser- und Abwasserprobleme im modernen Textilveredlungsbetrieb),
W74-05255 5D

Recycling Water -- A Simple Solution,
W74-05274 5D

Fundamental View of the Closed Water Circuit (Der geschlossene Wasserkreislauf in grundsaetzlicher Betrachtung),
W74-05282 5D

A Pulp and Paper Mill with Fully Closed Recirculation System -- Utopia or Realistic Possibility. (Eine Zellstoff-und Papierfabrik mit vollstaendig geschlossenem Kreislauf -- eine Utopie oder eine realistische Moeglichkeit),
W74-05289 5D

RED MUD
Effects of Red Mud on Marine Animals,
W74-05325 5C

RED PINE TREES
Transpiration Measurement in Pines Using Tritiated Water as a Tracer,
W74-05197 5B

REFLECTION
Altitudinal Variation of Chlorophyll Concentration and Reflectance of the Bark of Populus tremuloides,
W74-04977 2I

REFRACTION (WATER WAVES)
Quasi-Weekly and Daily Profile Changes on a Distinctive Sand Beach,
W74-04964 2L

REGIONAL ANALYSIS
Aesthetics in Environmental Planning.
W74-04987 6G

Interstate Planning for Regional Water Supply and Pollution Control.
W74-05108 5D

Area-Wide Water and Sewerage System Plan and Capital Improvement Program.
W74-05242 5D

Water Resources Management,
W74-05396 6B

REGIONAL DEVELOPMENT
Sewerage Feasibility Study, Broome County, New York, Summary, Conclusions and Recommendations.
W74-05233 5D

Regional Water and Sewer Plan, The Mid-Missouri Region.
W74-05238 5D

REGIONAL PLANNING
Regional Wastewater Management Systems,
W74-05389 5D

REGIONAL WATER SYSTEMS
Regional Wastewater Management Systems,
W74-05389 5D

REGRESSION ANALYSIS
Regression Techniques for Estimation of Sulfate in Streams Draining an Area Affected by Coal Mining,
W74-05125 5B

REGULATION
Status of State Coastal Zone Management Efforts.
W74-04995 2L

A Bibliography on Legal and Regulatory Aspects of Water Pollution Control and Abatement, Part I: Abstracts.
W74-05004 5G

A Bibliography on Legal and Regulatory Aspects of Water Pollution Control and Abatement, Part II: Subject Index.
W74-05005 5G

Public Control and Regulation,
W74-05082 6E

General Environmental Siting Guides for Nuclear Power Plants -- Topics and Bases, (Draft).
W74-05180 5G

AEC Implementation of the National Environmental Policy Act in Its Licensing and Regulation of Nuclear Facilities,
W74-05186 5G

Economic Impact of Pollution Abatement on the Sulfite Segment of the U.S. Pulp and Paper Industry,
W74-05277 5D

REGULATIONS
Systematic Design of Legal Regulations for Optimal Surface-Groundwater Usage--Phase 1,
W74-04853 4B

REHABILITATION
Aeration System Revitalizes Lakes.
W74-05060 5C

RELATIVE POTENCY
The Estimation of Relative Potency from Two Parabolas in Symmetric Bioassays,
W74-04899 5A

RELIABILITY THEORY
Prediction of the Start of Erosion in the Light of Principles of Reliability Theory, (In Russian),
W74-05347 2J

REMOTE SENSING
Development and Flight Test of the Multichannel Ocean Color Sensor (MOCS),
W74-05026 7B

A Theory of Microwave Apparent Temperature Over the Ocean,
W74-05126 2B

Radiological Survey of the Area Surrounding the Elk River Reactor, Elk River, Minnesota.
W74-05179 5B

REPAIRING
Maintenance of Water Distribution Systems,
W74-05013 5F

REPRESSIBLE PHOSPHATASES
Synchronous Cultures of Chlamydomonas Reinhardti: Properties and Regulation of Repressible Phosphatases,
W74-05053 5C

REPRODUCTION
The Relationship of Soil Temperature and Cytokinin Production in Aspen Invasion,
W74-04978 2I

RESEARCH AND DEVELOPMENT
EXPRO '74--A Listing of Extramural Projects to be Funded in Fiscal Year 1974.
W74-04913 5G

Notes on Sedimentation Activities, Calendar Year 1971.
W74-04916 2J

RESEARCH FACILITIES
Santa Rita Experimental Range: Your Facility for Research on Semidesert Ecosystems,
W74-05227 3F

RESEARCH PRIORITIES
Aesthetics in Environmental Planning.
W74-04987 6G

RESERVOIR OPERATION
Optimization of Operation of a System of Flood Control Reservoirs,
W74-04858 4A

A Stochastic Snow Model to Evaluate Reservoir Operation,
W74-04918 4A

Optimal State Analysis of Reservoirs,
W74-05167 6A

RESERVOIR RELEASES
Optimization of Operation of a System of Flood Control Reservoirs,
W74-04858 4A

RESERVOIRS
Hydrologic Characteristics of Alder Creek, Iron County, Wisconsin,
W74-04920 4A

A Study of the Reliability of Continuous Water Quality Monitoring,
W74-04982 5A

Effect of an Upstream Reservoir on the Stratification Conditions in Slapy Reservoir,
W74-05069 5C

Changes of Some Chemical Constituents and Bacterial Numbers in Slapy Reservoir During Eight Years,
W74-05070 5C

The Changes in Several Parameters of Plankton Primary Productivity in Slapy Reservoir 1960-1967, Their Mutual Correlations and Correlations with the Main Ecological Factors,
W74-05071 5C

The Changes of Benthos in Slapy Reservoir in the Years 1960-1961,
W74-05072 5C

Limnology of Two Re-Regulation Reservoirs in Czechoslovakia,
W74-05073 5C

The Influence of Two Re-Regulation Reservoirs on the Chemical and Bacteriological Properties of River Water,
W74-05074 5C

Pressure Interference Effects Within Reservoirs and Aquifers,
W74-05087 4B

Effect of Two Impoundments on the Salinity and Quantity of Stored Waters,
W74-05335 5B

Mathematical Approach to Water Resources Management in Italy,
W74-05397 6A

RESISTANCE
Survival of Brook Trout in a Bog-Derived Acidity Gradient,
W74-04873 5C

RESOURCE ALLOCATION
Regional Wastewater Management Systems,
W74-05389 5D

RESPIRATION
Respiration of a Sublittoral Community,
W74-04874 5B

RETENTION
Water-Holding Capacity of Coarse and Medium Loesslike Loams (O vodouderzhivayushchey sposobnosti legkikh i srednikh lessovidnykh suglinkov),
W74-05020 2G

REVERSE OSMOSIS
Effects of Waste Water Recycle in a Paperboard Mill,
W74-05254 5D

A Mathematical Model for Optimizing the Design of Reverse Osmosis Systems,
W74-05276 5D

REVIEWS
A Review of Estuarine Modeling,
W74-04929 2L

Kraft Pulping Effluent Treatment and Reuse - State of the Art,
W74-05110 5D

Fundamental View of the Closed Water Circuit (Der geschlossene Wasserkreislauf in grundsaetzlicher Betrachtung),
W74-05282 5D

A Review of Water Analysis by Atomic Absorption,
W74-05292 5A

RHODE ISLAND
Lipopolysaccharide from a Gram-Negative Marine Bacterium,
W74-04896 5A

Hurricane Studies for Narragansett Bay,
W74-04970 8B

Rhode Island's Barrier Beaches: Volume I, a Report on a Management Problem and an Evaluation of Options,
W74-05152 2L

RHODOPHYTA
The Ultrastructure of an Alloparasitic Red Alga Choreocolax Polysiphoniae,
W74-05299 5C

Research on Red Algal Pigments. 5. The Effect of the Intensity of White and Green Light on the Rate of Photosynthesis and its Relationship to Pigment Components in Gracilaria Compressa (C. AG.) Grev. (Rhodophyceae, Gigartinales),
W74-05300 5C

RICE
Influence of Water Regime on the Indirect Absorption of Radiocesium, Radiostrontium, and Radiocobalt by Lowland Rice,
W74-05199 5B

RICE FIELDS
Preliminary Laboratory Tests for the Control of Algae in Rice Fields (In Italian),
W74-05357 5C

RIDGING (SEA ICE)
Classification and Variation of Sea Ice Ridging in the Arctic Basin,
W74-05165 2C

RISKS
Worth of Data Used in Digital-Computer Models of Ground-Water Basins,
W74-04975 4B

RIVER BASIN DEVELOPMENT
The Identification and Quantification of the Net Effects of Multiple-Purpose River Basin Development,
W74-04854 4A

Econometric Model for River Basin Planning,
W74-04999 4A

Interstate Planning for Regional Water Supply and Pollution Control.
W74-05108 5D

Riverbanks Improvement Program,
W74-05234 6F

Water Resources Management,
W74-05396 6B

RIVER BASINS
The Development and Field Testing of a Basin Hydrology Simulator,
W74-04984 2A

RIVER FORECASTING
Planning for the Ultimate Hydraulic Development of the Nile Valley,
W74-04997 4A

RIVERS
Model Laws for Coastal and Estuarine Models,
W74-04957 2L

The Coastline of River-Deltas,
W74-04961 2L

The Influence of Two Re-Regulation Reservoirs on the Chemical and Bacteriological Properties of River Water,
W74-05074 5C

Large Rivers of the United States.,
W74-05138 2E

Effect of Hydrometeorological Conditions on Time of Ice Formation on Rivers in the Baltic Sea Region and Belorussia (Vliyaniye gidrometeorologicheskikh uslovity na sroki poyavleniya l'da na rekakh Pribaltiki i Belorussii),
W74-05143 2C

Riverbanks Improvement Program,
W74-05234 6F

ROACH
Combined Rearing of the Pike-Perch Lucioperca lucioperca (L.) and Roach Rutilus rutilus Heckeli (Nordm.) in Liman Fish Farms of Kuban, (In Russian),
W74-04923 8I

ROAD CONSTRUCTION
North Slope - Construction Criteria for Roads and Facilities,
W74-05104 4A

ROOT ZONE
Water Properties and Water Regime of Sod Podzolic Soils and Means of their Improvement (In Russian),
W74-05370 3F

ROUGHNESS COEFFICIENT
On the Calculation of the Roughness Parameter of Sea Ice,
W74-05164 2C

ROUGHNESS (MECHANICAL)
On the Calculation of the Roughness Parameter of Sea Ice,
W74-05164 2C

RUN-UP
Experimental Determination of Run-up of Undular and Fully Developed Bores and an Examination of Transition Modes and Internal Structure,
W74-04936 8B

RUNOFF
Compositional Modeling of Hydrographs (Kompozitsionnoye modelirovaniye gidrografov),
W74-05146 2A

RUNOFF FORECASTING
A Stochastic Snow Model to Evaluate Reservoir Operation,
W74-04918 4A

SAFETY
General Environmental Siting Guides for Nuclear Power Plants -- Topics and Bases, (Draft).
W74-05180 5G

SAFFORD VALLEY (ARIZ)
An Analysis of the Water Quality Problems of the Safford Valley, Arizona,
W74-04976 5B

SAGINAW COUNTY (MICHIGAN)
Saginaw County Water and Wastewater Utility Master Plan.
W74-05243 5D

SAGITTA ELEGANS
Breeding and Growth of the Chaetognath Sagitta Elegans in Bedford Basin,
W74-05317 5C

SALINE SOILS
Experiment in Rapid Leaching of Saline Soils in the Golodnaya Steppe (Opyt uskorennoy promyvki zasolennykh pochv Golodnoy stepi),
W74-05018 3C

General Report on Development and Utilization of Saline Soils in Iran,
W74-05218 3C

Experience of Meadow Soil Desalination in Murgab Oasis (In Russian),
W74-05368 3C

Some Data on Secondary Salinization on Krasnoznamenskii Irrigated Massif, (In Russian),
W74-05376 3I

SALINE WATER
An Analysis of the Water Quality Problems of the Safford Valley, Arizona,
W74-04976 5I

Preliminary Studies on the Mechanisms Controlling the Salinity in Northwestern Arid Region of India--a Discussion on the Causes of Salinity in the Groundwater Regime,
W74-05132 2F

SALINE WATER SYSTEMS
Preliminary Studies on the Mechanisms Controlling the Salinity in Northwestern Arid Region of India--a Discussion on the Causes of Salinity in the Groundwater Regime,
W74-05132 2F

SALINITY
Computer Simulation of the Hydrologic and Salinity Flow Systems Within the Bear River Basin,
W74-04860 5B

Bomex Rainy Day Analysis,
W74-04921 2B

Sea Surface Temperature and Salinity Conditions in 1969 at Agate Beach and Yaquina Bay, Oregon,
W74-04935 2L

Salinity Intrusion in Estuaries,
W74-04954 2L

Model Laws for Coastal and Estuarine Models,
W74-04957 2L

Tidal and Salinity Model Practice,
W74-04958 2L

An Analysis of the Water Quality Problems of the Safford Valley, Arizona,
W74-04976 5B

Water Management,
W74-05000 4A

Annotated Bibliography on Effects of Salinity and Salinity Changes on Life in Coastal Waters,
W74-05031 2J

Hydrographic Atlas of North Carolina Estuarine and Sound Waters, 1972,
W74-05032 2J

Effect of Two Impoundments on the Salinity and Quantity of Stored Waters,
W74-05335 5B

SALINITY INTRUSION
Salinity Intrusion in Estuaries,
W74-04954 2L

SALINIZATION (SOILS)
Some Data on Secondary Salinization of Krasnoznamenskii Irrigated Massif, (In Russian),
W74-05376 3F

SALISBURY (MD
Dissolved Oxygen and Iron in Shallow Wells at Salisbury, Md.,
W74-05078 5B

SALMON
Low pH Levels Wipe Out Salmon and Trout Populations in Southernmost Norway,
W74-05356 5C

SALMONELLA-TYPHI
Drug Resistance of Coliform Bacteria in Hospital and City Sewage,
W74-05361 5B

SALMONOID
On the Problem of Host Specificity, Reservoir Parasitism and Secondary Invasions of Camallanus lacustris (Nematoda:Camallanidae), (In Czech),
W74-05359 5C

SALT MARSHES
The Effects of Hurricane Camille on the Marshes of the Mississippi River Delta,
W74-04875 2L

Research to Determine the Environmental Response to the Deposition of Spoil on Salt Marshes Using Diked, and Undiked Techniques--First Annual Progress Report,
W74-05075 5C

Research to Determine the Environmental Response to the Deposition of Spoil on Salt Marshes Using Diked and Undiked Techniques--First Annual Progress Report,
W74-05332 5C

SALT TOLERANCE
An Analysis of the Water Quality Problems of the Safford Valley, Arizona,
W74-04976 5B

SALT WATER INTRUSION
Tidal and Salinity Model Practice,
W74-04958 2L

SALTS
Controlled Solution Mining in Massive Salt,
W74-05103 8B

Possible Cause of Formation of Horizontal Hydrogeochemical Zonality of Groundwater in Central Kazakhstan (O vozmozhnoy prichine vozniknoveniya gorizontal'noy gidrogeokhimicheskoy zonal'nosti podzemnykh vod v Tsentral'nom Kazakhstane) ,
W74-05147 2F

Experience of Meadow Soil Desalination in Murgab Oasis (In Russian),
W74-05368 3C

SAMPLE PREPARATION
Esterification of (2,4-Dichlorophenoxy)Acetic Acid - A Quantitative Comparison of Esterification Techniques,
W74-05312 5A

Preparation of Filtered Plankton and Detritus for Study with Scanning Electron Microscopy,
W74-05320 5A

SAMPLE PRESERVATION
Preservation of Dilute Mercury Solutions,
W74-05310 5A

SAMPLING
Borehole Sampling of Satuarated Uncemented Sands and Gravels,
W74-05081 8G

Gamma-Emitting Radionuclides in Alaskan Environments 1967-1970,
W74-05187 5B

Settling Plates of Cold-Cure Acrylic Plastic Replicated from Natural Surfaces,
W74-05319 5A

SAMPLING EQUIPMENT
A Sampler for the Chemical Analysis of Freshwaters Using Evacuated Tubes,
W74-05321 7B

SAN ANTONIO (TEX
Ground-Water Resources of the San Antonio Area, Texas: A Progress Report on Studies, 1960-1964,
W74-04992 4B

Reliability and Economic Optimization for Urban Return Flows Management,
W74-05333 5B

SAN JOAQUIN VALLEY (CALIF)
Nutrients from Tile Drainage Systems, Bio-Engineering Aspects of Agricultural Drainage, San Joaquin Valley, California.
W74-05229 5B

SAND BARS
Residence Time of Sand Composing the Beaches and Bars of Outer Cape Cod,
W74-04968 2J

SANDS
Sand Losses from a Coast by Wind Action,
W74-04967 2J

Variations in the Height of Wave Run-Up on a Sandy Beach,
W74-05025 2L

SANDY DESERT
Study of Condensed Water Accumulation in Sandy Desert, (In Russian),
W74-05115 2G

SANDY SOIL
Content and Composition of Organic Matter in Sod Podzolic and Sod Sandy Soils of Different Degrees of Wetting, (In Russian),
W74-05237 2G

SANTA BARBARA CHANNEL (CALIF)
Report on the Composition of Oil from the Region of New Hydrocarbon Upwelling in the Santa Barbara Channel,
W74-04919 5A

SAPELO ISLAND (GEO)
Respiration of a Sublittoral Community,
W74-04874 5B

SATURATION
Contribution to the Method for the Determination of Sublethal Water Deficit,
W74-05365 2I

SAVANNAH RIVER (SO CAR)
Environmental Activities and Programs at the Savannah River Plant.
W74-05173 5B

SCANNING ELECTRON MICROSCOPY
Scanning Electron Microscopy of Bacterial Colonies,
W74-04885 5A

Preparation of Filtered Plankton and Detritus for Study with Scanning Electron Microscopy,
W74-05320 5A

SCOUR
Experimental Studies of Beach Scour Due to Wave Action,
W74-05035 2J

SEA ICE
The Aidjex Lead Experiment,
W74-05158 2C

A Relation Between the Potential Energy Produced by Ridging and the Mechanical Work Required to Deform Pack Ice,
W74-05160 2C

Redistribution Functions and Their Yield Surfaces in a Plastic Theory of Pack Ice Deformation,
W74-05161 2C

Dimensionless Strength Parameters for Floating Ice Sheets,
W74-05162 2C

A Mechanical Model of Rafting,
W74-05163 2C

On the Calculation of the Roughness Parameter of Sea Ice,
W74-05164 2C

Classification and Variation of Sea Ice Ridging in the Arctic Basin,
W74-05165 2C

SEA WALLS
Experimental Studies of Beach Scour Due to Wave Action,
W74-05035 2J

SEA WATER
Bomex Rainy Day Analysis,
W74-04921 2B

Anodic Stripping Voltammetry of Zinc in Seawater with a Tubular Mercury-Graphite Electrode,
W74-05305 5A

SEALANTS
Abatement of Mine Drainage Pollution by Underground Precipitation,
W74-05106 5G

SEASONAL
Respiration of a Sublittoral Community,
W74-04874 5B

Sea Surface Temperature and Salinity Conditions in 1969 at Agate Beach and Yaquina Bay, Oregon,
W74-04935 2L

Seasonal Changes in Beaches of the North Atlantic Coast of the United States,
W74-04963 2J

Seasonal Variability of Water Temperature in the Vicinity of the Japan Current (Vnutrisezonnaya izmenchivost' temperatury vody v rayone Kurosio),
W74-05150 2E

SECONDARY RECOVERY (OIL)
Environmental Aspects of Natural Gas Stimulation Experiments with Nuclear Devices,
W74-05184 5B

SEDIMENT CONTROL
Comparative Costs of Erosion and Sediment Control, Construction Activities.
W74-04986 4D

SEDIMENT TRANSPORT
Some Modern Approaches to Beach Studies,
W74-04930 2J

Nearshore Processes,
W74-04932 2L

Cause and Prediction of Beach Erosion,
W74-04945 2J

Coastal Movable Bed Scale Model Technology,
W74-04949 2J

Coastal Processes,
W74-04951 2L

Sedimentation in Estuaries,
W74-04955 2L

Field Experience in Estuaries,
W74-04956 2L

The Internal Velocity Field in Breaking Waves,
W74-04960 2J

The Coastline of River-Deltas,
W74-04961 2L

Theoretical Forms of Shorelines,
W74-04962 2L

Quasi-Weekly and Daily Profile Changes on a Distinctive Sand Beach,
W74-04964 2L

Wave Energy and Littoral Transport,
W74-04965 2J

Quantitative Research on Littoral Drift in Field and Laboratory,
W74-04966 2J

Sand Losses from a Coast by Wind Action,
W74-04967 2J

Residence Time of Sand Composing the Beaches and Bars of Outer Cape Cod,
W74-04968 2J

Longshore Currents and Sediment Motion in the Coastal Zone of the Sea of Azov,
W74-05024 2L

Movement of Water Along the Shore and Normal to it in the Near-Shore Zone of a Shallow-Water Coast,
W74-05028 2L

Sedimentary Processes on the Continental Slope Off New England,
W74-05043 2J

SEDIMENTATION
Notes on Sedimentation Activities, Calendar Year 1971.
W74-04916 2J

Hydrologic Characteristics of Alder Creek, Iron County, Wisconsin,
W74-04920 4A

Tidal Dynamics in Estuaries. Part I: Estuaries of Rectangular Section,
W74-04952 2L

Sedimentation in Estuaries,
W74-04955 2L

Field Experience in Estuaries,
W74-04956 2L

Sedimentary Processes on the Continental Slope Off New England,
W74-05043 2J

SEDIMENTOLOGY
Basic Patterns in the Distribution of Chemical Elements in Deep-Sea Sediments of the Black Sea (Osnovnyye zakonomernosti raspredeleniya khimicheskikh elementov v tolshche glubokovodnykh osadkov Chernogo morya),
W74-05023 5B

SEDIMENTS
Characteristics of Organic-Matter Distribution in Calcareous Sediments of the Caspian Sea and in Mesozoic Carbonate Rocks of the Southeastern Caucasus (Osobennosti raspredeleniya organicheskogo veshchestva v izvestkovykh osadkakh Kaspiyskogo morya i karbonatnykh porodakh mezozoya yugo-vostochnogo Kavkaza),
W74-05021 5B

SEEPAGE
Investigations on the Transfer of Bioelements from Organic Matter to Soil Solution in the Humus Layer of a Beech Stand (In German),
W74-05367 2G

SELECTIVE MEDIA
Urease Activity of Enterobacteriaceae: Which Medium to Choose,
W74-04888 5A

SEPARATION TECHNIQUES
Selective Chromatographic Separation of Uranium(VI) on Deae-Cellulose Layers in Dilute Acetic Acid Media,
W74-04864 5A

Solvent Extraction of Metal Chelates into Water-Immiscible Acetone,
W74-05311 5A

SESARMA
Taxonomy, Distribution and Ecology of the Genus Sesarma (Crustacea, Decapoda, Grapsidae) in Eastern North America, with Special Reference to Florida,
W74-04880 2I

SETTLING PLATES
Settling Plates of Cold-Cure Acrylic Plastic Replicated from Natural Surfaces,
W74-05319 5A

SEWAGE
Drug Resistance of Coliform Bacteria in Hospital and City Sewage,
W74-05361 5B

Direct Counts and Plate Counts of Bacteria in the Danube between Berg Spring and Ulm (In German),
W74-05362 5A

The Use of Mineral Fertilizers in Irrigation with Pure Water, Sewage and Liquid Manure, (In Russian),
W74-05371 3F

SEWAGE DISPOSAL
Sewerage Feasibility Study, Broome County, New York, Summary, Conclusions and Recommendations.
W74-05233 5D

SEWAGE DISTRICTS
Sewage Collection and Treatment Systems: Issues in and Approaches to Impact Analysis,
W74-05241 6B

SEWAGE TREATMENT
Prattville, Alabama, Community Development Plan, Volume I: Text.
W74-04991 6B

Modeling of Wastewater Disposal Systems,
W74-05388 5D

SEWER FLOW
Development of a Meter for Measurement of Sewer Flow,
W74-04857 8B

SEWERAGE
Economic, Social and Environmental Impacts of Public Works, Vol. I Pittsburgh Area Studies, Vol. II. The Alegheny County Sanitary

Authority (AlCoSan) Facility, Vol. III. Impact Analysis,
W74-05231 6B

Sewerage Feasibility Study, Broome County, New York, Summary, Conclusions and Recommendations.
W74-05233 5D

Regional Water and Sewer Plan, The Mid-Missouri Region.
W74-05238 5D

Sewage Collection and Treatment Systems: Issues in and Approaches to Impact Analysis,
W74-05241 6B

Area-Wide Water and Sewerage System Plan and Capital Improvement Program.
W74-05242 5D

Saginaw County Water and Wastewater Utility Master Plan.
W74-05243 5D

SEWERS
Combined Sewer Overflow for The Hudson River Conference,
W74-05112 5D

SHALLOW WATER
Experimental Determination of Run-up of Undular and Fully Developed Bores and an Examination of Transition Modes and Internal Structure,
W74-04936 8B

Some Three-Dimensional Effects in Surf,
W74-04942 2J

Selection and Design of a Bore Generator for the Hilo Harbor Tsunami Model. Hydraulic Model Investigation,
W74-04946 8B

Cnoidal Waves in Shallow Water,
W74-04959 2L

The Internal Velocity Field in Breaking Waves,
W74-04960 2J

The Coastline of River-Deltas,
W74-04961 2L

Quasi-Weekly and Daily Profile Changes on a Distinctive Sand Beach,
W74-04964 2L

Movement of Water Along the Shore and Normal to it in the Near-Shore Zone of a Shallow-Water Coast,
W74-05028 2L

Composite Energy Fluxes as Factors in Coastal Formation,
W74-05029 2L

Nonlinear Development of the Rayleigh-Taylor Instability in the 'Shallow-Water' Approximation,
W74-05034 2L

Experimental Studies of Beach Scour Due to Wave Action,
W74-05035 2J

SHOALING
The Internal Velocity Field in Breaking Waves,
W74-04960 2J

SHORE CRABS
Taxonomy, Distribution and Ecology of the Genus Sesarma (Crustacea, Decapoda, Grapsidae) in Eastern North America, with Special Reference to Florida,
W74-04880 2I

SHORE PROTECTION
Edge Bores,
W74-04948 8B

Hurricane Studies for Narragansett Bay,
W74-04970 8B

SHORELINE CONFIGURATION
Theoretical Forms of Shorelines,
W74-04962 2L

SHORES
Estuary and Coastline Hydrodynamics.
W74-04950 2L

Theoretical Forms of Shorelines,
W74-04962 2L

SHREVEPORT (LA
Effect of Watershed Area Oil Fields on Water Quality,
W74-05079 5B

SHRIMP
Effects of Red Mud on Marine Animals,
W74-05325 5C

SIEROZEM SOILS
Effect of Crops and their Predecessors on the Aggregate Composition of Meadow Sierozem Soils, (In Russian),
W74-05374 3F

SIEROZEMS
Agrochemical Properties and Forms of Phosphates in Typical Sierozems Irrigated at Various Times, (In Russian),
W74-05377 3F

SILVER
Water-Pollution Control in the Primary Nonferrous-Metals Industry -- Volume II. Aluminum, Mercury, Gold, Silver, Molybdenum, and Tungsten,
W74-05117 5D

SIMULATION ANALYSIS
The Application of Binary Tree Structures to Hydrologic Network Simulators,
W74-04852 4A

Computer Simulation of the Hydrologic and Salinity Flow Systems Within the Bear River Basin,
W74-04860 5B

A Review of Estuarine Modeling,
W74-04929 2L

Practical Simulation Models of the Subsurface Hydrologic System with Example Applications,
W74-04973 2F

The Development and Field Testing of a Basin Hydrology Simulator,
W74-04984 2A

Planning for the Ultimate Hydraulic Development of the Nile Valley,
W74-04997 4A

Econometric Model for River Basin Planning,
W74-04999 4A

Cotton: A Computer Simulation of Cotton Growth,
W74-05213 3F

A Mathematical Model for Optimizing the Design of Reverse Osmosis Systems,
W74-05276 5D

A Regional Planning Model for Water Quality Control,
W74-05390 5B

Introduction to Simulation Techniques,
W74-05391 5G

Mathematical Model for Oxygen Balance in Rivers,
W74-05392 5B

An Economic Appraisal of Changes in Water Use Through Investments in Navigable Rivers and Canals,
W74-05395 6A

Mathematical Approach to Water Resources Management in Italy,
W74-05397 6A

SINKS
Retention Basin Failures in Carbonate Terranes,
W74-05337 5B

SITES
General Environmental Siting Guides for Nuclear Power Plants -- Topics and Bases, (Draft).
W74-05180 5G

SKIN EFFECT
The Skin Effect in Producing Wells,
W74-05088 8B

Wellbore Transmissibility from Afterflow-Dominated Pressure Buildup Data,
W74-05101 8G

SLAPY RESERVOIR (CZECHOSLOVAKIA)
Effect of an Upstream Reservoir on the Stratification Conditions in Slapy Reservoir,
W74-05069 5C

Changes of Some Chemical Constituents and Bacterial Numbers in Slapy Reservoir During Eight Years,
W74-05070 5C

The Changes in Several Parameters of Plankton Primary Productivity in Slapy Reservoir 1960-1967, Their Mutual Correlations and Correlations with the Main Ecological Factors,
W74-05071 5C

The Changes of Benthos in Slapy Reservoir in the Years 1960-1961,
W74-05072 5C

SLOPE EROSION
Influence of Parent Material and Slope Exposure on Properties of Soils Related to Erodibility in North Central Anatolia,
W74-05066 2J

SLOPES
Longshore Currents at Nags Head, North Carolina,
W74-04928 2L

SLUDGE
The Oxygen Uptake Demand of Resuspended Bottom Sediments.
W74-05114 5C

SLUDGE DISPOSAL
Reuse of Solid Waste from Water-Softening Processes,
W74-05127 5D

Whither Clarified Sludge. (Wohin mit dem Klaerschlamm.),
W74-05266 5E

SLUDGE TREATMENT
Dynamic Behavior of a Complete-Mixing Activated Sludge System,
W74-04900 5D

Removal of Residual Waste Water Sludges (Beseitigung der Restabwasserschlaemme),
W74-05263 5D

Installation of Waste Water and Sludge Treatment Facilities at the Arjomari-Prioux Paper Mill at Rives-Sur-Fure (Installation de traitement des eaux residuaires et des boues de la papeterie Arjomari Prioux a Rives-sur-Fure).
W74-05264 5D

SLURRIES
Abatement of Mine Drainage Pollution by Underground Precipitation,
W74-05106 5G

SNAILS
Production of a Natural Population of Bithynia Tentaculata L. (Gastropoda, Mollusca),
W74-05049 5C

SNOW
Theory of Metamorphism of Wet Snow,
W74-05154 2C

SNOW METAMORPHISM
Theory of Metamorphism of Wet Snow,
W74-05154 2C

SNOWFALL
Lake Michigan Snow Squalls Increase Annual Precipitation in the Udell Hills,
W74-05124 2B

SNOWMELT
A Stochastic Snow Model to Evaluate Reservoir Operation,
W74-04918 4A

SOCIAL ASPECTS
The Identification and Quantification of the Net Effects of Multiple-Purpose River Basin Development,
W74-04854 4A

Pollution -- Yesterday, Today, and Tomorrow,
W74-05272 5D

SOCIAL BENEFITS
Economic Aspects of a Nuclear Desalination Agro-Industrial Project in the United Arab Republic,
W74-05382 3A

SOCIAL CHANGE
The Human Ecological Impact of Structural Flood Control on the Iowa River, Iowa,
W74-04856 8A

SOCIAL IMPACT
The Human Ecological Impact of Structural Flood Control on the Iowa River, Iowa,
W74-04856 8A

Aesthetics in Environmental Planning.
W74-04987 6G

Economic, Social and Environmental Impacts of Public Works, Vol. I Pittsburgh Area Studies, Vol. II. The Alegheny County Sanitary Authority (AlCoSan) Facility, Vol. III. Impact Analysis,
W74-05231 6B

Sewage Collection and Treatment Systems: Issues in and Approaches to Impact Analysis,
W74-05241 6B

Measuring Impacts of Water Resource Developments on the Human Environment,
W74-05338 6G

SOCKEYE SALMON
Isolation and Chemical Identification of Toxic Components of Kraft Mill Wastes,
W74-05270 5A

SOD PODZOLIC SOILS
Water Regime of Sod Podzolic Soils Under Spruce Forests of Different Ages, (In Russian),
W74-05343 4A

Water Properties and Water Regime of Sod Podzolic Soils and Means of their Improvement (In Russian),
W74-05370 3F

Toxicity of Sod Podzolic Soils Lysimetric Solutions, (In Russian),
W74-05375 2G

The Effect of Different Tillage Methods on the Physical Properties of Soil, (In Russian),
W74-05378 2G

SOIL AGGREGATES
Effect of Crops and their Predecessors on the Aggregate Composition of Meadow Sierozem Soils, (In Russian),
W74-05374 3F

SOIL ANALYSIS
Determination of the Absorption Capacity in Soils, (In Russian),
W74-04947 2G

SOIL CHEMISTRY
General Report on Development and Utilization of Saline Soils in Iran,
W74-05218 3C

The Possibility of Soda Formation in Soil by Biochemical Means, (In Russian),
W74-05271 2G

SOIL COMPARISONS
Comparative Characteristics of Desert Soils of USSR and Australia, (In Russian),
W74-04998 2G

SOIL CONSERVATION
Effect of an Exceptional Storm on Soil Conservation at Samaru, Nigeria,
W74-05340 2J

SOIL CONTAMINATION
Persistence of Radionuclides in Soil, Plants, and Small Mammals in Areas Contaminated with Radioactive Fallout,
W74-05194 5B

Influence of Water Regime on the Indirect Absorption of Radiocesium, Radiostrontium, and Radiocobalt by Lowland Rice,
W74-05199 5B

SOIL DESALINATION
Experience of Meadow Soil Desalination in Murgab Oasis (In Russian),
W74-05368 3C

SOIL DISPOSAL FIELDS
Inventory of Spray Irrigation Systems in the Great Lakes Basin of Canada.
W74-05288 5D

SOIL EROSION
Comparative Costs of Erosion and Sediment Control, Construction Activities.
W74-04986 4D

Influence of Parent Material and Slope Exposure on Properties of Soils Related to Erodibility in North Central Anatolia,
W74-05066 2J

Erosion Control and Vegetative Cover Under Dryland Conditions in Turkey,
W74-05220 3F

Results of a Second Study of Wind-Eroded Soils in the Pavlodar Priirtyshye (In Russian),
W74-05369 2J

SOIL MOISTURE
Water-Holding Capacity of Coarse and Medium Loesslike Loams (O vodouderzhivayushchey sposobnosti legkikh i srednikh lessovidnykh suglinkov),
W74-05020 2G

Effect of Excess Moisture on Trace Element Distribution in Soils of Liningrad Oblast (O vliyanii izbytochnogo uvlazhneniya na raspredeleniye mickroelementov v pochvakh Leningradskoy oblasti),
W74-05148 2G

Hydric Regime of an Argiudol (In Spanish),
W74-05324 2G

SOIL PHYSICAL PROPERTIES
Effect of Dibbling of Winter Fallow on Hydrophysical Properties of Frozen Soil and on Erosion Processes (Vliyaniye lunkovaniya zyabi na vodno-fizicheskiye svoystva merzloy pochvy i protsessy erozii),
W74-05019 2G

SOIL PHYSICS
Water-Holding Capacity of Coarse and Medium Loesslike Loams (O vodouderzhivayushchey sposobnosti legkikh i srednikh lessovidnykh suglinkov),
W74-05020 2G

SOIL PROPERTIES
Soil as a Medium for the Renovation of Acid Mine Drainage Water,
W74-04981 5D

The Effect of Different Tillage Methods on the Physical Properties of Soil, (In Russian),
W74-05378 2G

SOIL SOLUTION
Investigations on the Transfer of Bioelements from Organic Matter to Soil Solution in the Humus Layer of a Beech Stand (In German),
W74-05367 2G

SOIL TEMPERATURE
The Relationship of Soil Temperature and Cytokinin Production in Aspen Invasion,
W74-04978 2I

SOIL TREATMENT
Results of a Second Study of Wind-Eroded Soils in the Pavlodar Priirtyshye (In Russian),
W74-05369 2J

SOIL TYPES
Agrochemical Properties and Forms of Phosphates in Typical Sierozems Irrigated at Various Times, (In Russian),
W74-05377 3F

SOIL WATER
Influence of Soil Water Logging During Spring, Followed by Summer Dryness, on the Behavior of Young Plants of Norway Spruce, (In French),
W74-05348 2I

SOIL WATER POTENTIALS
Soil-Water-Potentials Depending on Temperature, (In German),
W74-05372 2G

SOILS
Estimating the Density of Individual Bacterial Populations Introduced into Natural Ecosystems,
W74-04890 5A

Comparative Study of the Physicochemical Properties of Meliorated and Non-Meliorated Soils at the Mugan Experimental Melioration Station, (In Russian),
W74-05037 2G

Soil Respiration, Nitrogen Mineralization and Humus Decomposition of East African Soils after Drying and Remoistening (In German),
W74-05054 2G

The Influence of Precipitation and Altitude on the Humus Content of East African Soils (In German),
W74-05058 2G

Effect of Excess Moisture on Trace Element Distribution in Soils of Liningrad Oblast (O vliyanii izbytochnogo uvlazhneniya na raspredeleniye mickroelementov v pochvakh Leningradskoy oblasti),
W74-05148 2G

Cesium-137 Soil Inventory of a Tagged Liriodendron Forest 1962 and 1969,
W74-05193 5B

The Soils of the Ural River Zone in the Gurev Region and their Improvements During Irrigation, (In Russian),
W74-05205 2G

Problems of the Organic Matter of Organogenic Soils, (In Russian),
W74-05279 2G

SOILS (IRRIGATED)
Efficacy of Large Doses of Mineral Fertilizers in Irrigated Soils, (In Russian),
W74-05379 3F

SOLVENT EXTRACTIONS
Trace Soluable Organic Compounds in Potable Water Supplies,
W74-04855 5A

A Technique for Extraction and Storage of Water Samples for Mn, Cd, and Pb Determination by Atomic Absorption Spectroscopy,
W74-05293 5A

Solvent Extraction of Metal Chelates into Water-Immiscible Acetone,
W74-05311 5A

SOLVENTS
Use of Multiple R Sub F Values for Identification by Paper and Thin-Layer Chromatography,
W74-05307 5A

SORBENTS
Oil Recovery System Using Sorbent Material,
W74-04985 5G

SORPTION
Oil Recovery System Using Sorbent Material,
W74-04985 5G

Relationships Between Phosphorus-32 Accumulation in Algae, Bacteria, and Tubificids,
W74-05206 5C

SOUTH AFRICA (UMSINDUSI RIVER)
Physioecology of the Umsindusi River within the Pietermaritzburg City Limits,
W74-05363 5B

SOUTH AMERICA
Practical Simulation Models of the Subsurface Hydrologic System with Example Applications,
W74-04973 2F

SOUTH CAROLINA
Environmental Activities and Programs at the Savannah River Plant.
W74-05173 5B

SOUTHEAST U
The Characeae of Southeastern United States,
W74-04879 5A

Cesium-137 in White-Tailed Deer as Related to Vegetation and Soils of the Southeastern United States,
W74-05190 5B

SPATIAL DISTRIBUTION
Spatial Differentiation and Changes in Time of Zoomicrobenthos in Three Masurian Lakes,
W74-05050 5C

Spatial Differentiation Abundance of Bacteria in the Water of Mikolajskie Lake,
W74-05051 5C

SPECIATION
The Characeae of Southeastern United States,
W74-04879 5A

An Appraisal of Identification Methods for Penicillium Species: Novel Taxonomic Criteria Based on Temperature and Water Relations,
W74-04902 5A

SPECIFIC HEAT
Clustering in Supercooled Water,
W74-05251 1A

SPECTROMETERS
Development and Flight Test of the Multichannel Ocean Color Sensor (MOCS),
W74-05026 7B

SPECTROPHOTOMETRY
Determination of Eight Metals in the International Biological Standard by Flameless Atomic-Absorption Spectrometry,
W74-04868 5A

New Ultraviolet Ratio Spectrophotometric System for the Determination of Trace Amounts of Phenolic Compounds,
W74-05244 5A

Spectrophotometric Determination of Low Levels of Mono-, Di-, and Triethylene Glycols in Surface Waters,
W74-05290 5A

The Quantitative Determination of Chromium in Urine by Flameless Atomic Absorption Spectroscopy,
W74-05291 5A

A Review of Water Analysis by Atomic Absorption,
W74-05292 5A

A Technique for Extraction and Storage of Water Samples for Mn, Cd, and Pb Determination by Atomic Absorption Spectroscopy,
W74-05293 5A

Effects of Surfactants on Atomic Absorption Analysis of Dilute Aqueous Copper and Nickel Solutions,
W74-05313 5A

The Determination of Cobalt in Fish Tissue by Atomic Absorption Spectrophotometry,
W74-05399 5A

SPECTROPHTOMETRY
Field Ionization Mass Spectrometry: A New Tool for the Analytical Chemist,
W74-05302 5A

SPECTRORADIOMETERS
Development and Flight Test of the Multichannel Ocean Color Sensor (MOCS),
W74-05026 7B

SPECTROSCOPY
Inductively Coupled Plasma-Optical Emission Analytical Spectrometry. A Compact Facility for Trace Analysis of Solutions,
W74-05309 5A

SPOIL BANKS
Research to Determine the Environmental Response to the Deposition of Spoil on Salt Marshes Using Diked, and Undiked Techniques--First Annual Progress Report,
W74-05075 5C

SPRUCE
Water Regime of Sod Podzolic Soils Under Spruce Forests of Different Ages, (In Russian),
W74-05343 4A

Microclimatic Conditions on the Cutover Areas of Shelterwood Cuttings, (In Russian),
W74-05349 2I

SPRUCE (NORWAY)
Influence of Soil Water Logging During Spring, Followed by Summer Dryness, on the Behavior of Young Plants of Norway Spruce, (In French),
W74-05348 2I

ST
A Study on Mixing and Circulation in the St. Lawrence Estuary Up to 1964,
W74-04944 2L

Water Resources Outlook for the Minneapolis-Saint Paul Metropolitan Area, Minnesota,
W74-05172 4B

STABILITY
Preservation of Dilute Mercury Solutions,
W74-05310 5A

STANDARDS
AEC Implementation of the National Environmental Policy Act in Its Licensing and Regulation of Nuclear Facilities,
W74-05186 5G

STARFISH
Polychlorinated Biphenyls in the Seastar Acanthaster Planci,
W74-05301 5A

STATE GOVERNMENTS
Status of State Coastal Zone Management Efforts.
W74-04995 2L

A Treatise on Centralized Management of Water Resources,
W74-05030 6E

STATE JURISDICTION
Reasonable State Regulation of the Interstate Transfer of Percolating Water,
W74-04980 4A

STATISTICAL METHODS
Approximating Discrete Distributions, with Applications,
W74-04892 7C

Bayesian Analysis of a Bivariate Normal Distribution with Incomplete Observations,
W74-04893 7C

The Estimation of Relative Potency from Two Parabolas in Symmetric Bioassays,
W74-04899 5A

Compositional Modeling of Hydrographs (Kompozitsionnoye modelirovaniye gidrografov),
W74-05146 2A

STATISTICAL MODELS
A Stochastic Snow Model to Evaluate Reservoir Operation,
W74-04918 4A

STERLET
Changes in Morphological Composition of the Blood of Larval Fish Bitten by Water Bugs Fam. Corixidae), (In Russian),
W74-05209 5C

STOCHASTIC PROCESSES
A Stochastic Snow Model to Evaluate Reservoir Operation,
W74-04918 4A

Wave Propagation in Continuous Random Media,
W74-05041 2J

STOMATAL RESPONSE
Stomatal Responses to Changes in Temperature at Increasing Water Stress,
W74-05366 2I

STORAGE CAPACITY
Controlled Solution Mining in Massive Salt,
W74-05103 8B

STORAGE COEFFICIENT
Pulse-Test Response of a Two-Zone Reservoir,
W74-05077 4B

How Areal Heterogeneities Affect Pulse-Test Results,
W74-05092 8G

STORM SURGES
The Ash Wednesday East Coast Storm, March 5-8, 1962. A Hindcast of Events, Causes, and Effects,
W74-04969 2J

Numerical Prediction on Typhoon Tide in Tokyo Bay,
W74-04971 2L

STORMS
CERC Bulletin and Summary Report of Research Progress for Fiscal Years 1965-66.
W74-04926 2L

Effect of Wave Action on Tidal Stages Along the Coast of Florida, March 1962,
W74-04927 2L

The Ash Wednesday East Coast Storm, March 5-8, 1962. A Hindcast of Events, Causes, and Effects,
W74-04969 2J

Movement of Water Along the Shore and Normal to it in the Near-Shore Zone of a Shallow-Water Coast,
W74-05028 2L

Composite Energy Fluxes as Factors in Coastal Formation,
W74-05029 2L

STORMS (SEVERE)
Effect of an Exceptional Storm on Soil Conservation at Samaru, Nigeria,
W74-05340 2J

STREAM EROSION
Experimental Study of River Incision,
W74-05134 2J

STREAMFLOW
Hydrologic Characteristics of Alder Creek, Iron County, Wisconsin,
W74-04920 4A

Large Rivers of the United States.,
W74-05138 2E

STREAMFLOW FORECASTING
The Development and Field Testing of a Basin Hydrology Simulator,
W74-04984 2A

STREETER-PHELPS EQUATION
Mathematical Model for Oxygen Balance in Rivers,
W74-05392 5B

STRESS STRAIN
The Effect of Impurities on the Mechanical Properties of Ice Single Crystals,
W74-04914 2C

STRONTIUM
Fallout Program Quarterly Summary Report, (Health and Safety Laboratory, AEC, New York),
W74-05174 5A

Fallout Program Quarterly Summary Report - June 1, 1973, Through September 1, 1973, Appendix,
W74-05175 5A

Radionuclide Biomagnification in Coastal-Plain Deer,
W74-05189 5B

Persistence of Radionuclides in Soil, Plants, and Small Mammals in Areas Contaminated with Radioactive Fallout,
W74-05194 5B

Influence of Water Regime on the Indirect Absorption of Radiocesium, Radiostrontium, and Radiocobalt by Lowland Rice,
W74-05199 5B

Strontium-90 and Cesium-137 in Water and Deep Sediments of the Great Lakes,
W74-05208 5C

SUBLETHAL LIMIT
Contribution to the Method for the Determination of Sublethal Water Deficit,
W74-05365 2I

SUBMERGED DISCHARGE
Workbook of Thermal Plume Prediction: Volume 1, Submerged Discharge,
W74-05111 5B

SUBSIDENCE
Predictive Simulation of the Subsidence of Venice,
W74-05137 2F

Retention Basin Failures in Carbonate Terranes,
W74-05337 5B

SUBSURFACE ENVIRONMENT
Subsurface Biological Activity in Relation to Ground Water Pollution,
W74-05230 5B

SUBSURFACE FLOW
Practical Simulation Models of the Subsurface Hydrologic System with Example Applications,
W74-04973 2F

SUBSURFACE INVESTIGATIONS
Subsurface Biological Activity in Relation to Ground Water Pollution,
W74-05230 5B

SUBSURFACE MICROBIOLOGY
Subsurface Biological Activity in Relation to Ground Water Pollution,
W74-05230 5B

SUBSURFACE WATERS
Subsurface Biological Activity in Relation to Ground Water Pollution,
W74-05230 5B

SUCCESSION
Invasion of Semidesert Grassland by Velvet Mesquite and Associated Vegetation Changes,
W74-05226 3F

SULFATES
Regression Techniques for Estimation of Sulfate in Streams Draining an Area Affected by Coal Mining,
W74-05125 5E

SULFIDE TREATMENT
Removal of Heavy Metals from Mine Drainage by Precipitation,
W74-04851 5D

SULFITE LIQUORS
Slow Releasing Nitrogen Fertilizer from the Waste Product, Lignin Sulphonates,
W74-05249 5E

The Purification of Residual Waste Waters of the Sulfite Pulp Industry (Die Reinigung von Restabwaessern der Sulfitzellstoff-Industrie),
W74-05260 5D

Characterization of Sulfite Pulping Effluents and Available Alternative Treatment Methods,
W74-05278 5D

SULFUR BACTERIA
Chemical Aspects of Underground Water,
W74-05080 4B

Corrosion Control Speeds Up,
W74-05090 8G

SUMPS
Detailed Project Report, Dyersburg, Tennessee, Finley Street Area.
W74-04989 4A

SUNFISHES
Thermal Effects on Biological Production in a Pond,
W74-04861 5C

The Biological Pathway of Zinc (Zn-65) in Freshwater Fish and its Alteration by Heavy Metals,
W74-05201 5C

SUPERCOOLING
Clustering in Supercooled Water,
W74-05251 1A

SURF
Some Three-Dimensional Effects in Surf,
W74-04942 2J

SURF ZONE
Longshore Currents Generated by Obliquely Incident Sea Waves,
W74-04943 2E

SURFACE-GROUNDWATER RELATIONSHIPS
Systematic Design of Legal Regulations for Optimal Surface-Groundwater Usage--Phase 1,
W74-04853 4B

The Development and Field Testing of a Basin Hydrology Simulator,
W74-04984 2A

Preliminary Studies on the Mechanisms Controlling the Salinity in Northwestern Arid Region of India--a Discussion on the Causes of Salinity in the Groundwater Regime,
W74-05132 2F

SURFACE WATERS
Water-Resources Appraisal of the Big Sandy Area, Mohave County, Arizona,
W74-04922 4B

SURGES
Hurricane Studies for Narragansett Bay,
W74-04970 8B

SURVEILLANCE PROGRAM
Radionuclides in the Environment at Nuclear Power Stations,
W74-05183 5B

SUSPENDED SOLIDS
Migration of Elements in River Waters (Migratsiya elementov v rechnykh vodakh),
W74-05022 5B

New Measuring Methods for Evaluating Waste Water Quality (Neuere Messverfahren zur Beurteilung der Abwasserqualitaet),
W74-05259 5A

SWEDEN (KVARNSVEDEN)
Measures Against Water Pollution in Mechanical Pulp and Paper Mills,
W74-05273 5D

SWITZERLAND
The Purification of Residual Waste Waters of the Sulfite Pulp Industry (Die Reinigung von Restabwaessern der Sulfitzellstoff-Industrie),
W74-05260 5D

SYNTHETIC RUBBER
Air Flotation-Biological Oxidation of Synthetic Rubber and Latex Waste-Water,
W74-05105 5D

SYSTEMATICS
Redescription of Mappates plataxus Rangnekar (Copepoda: Caligidae),
W74-04877 2I

The Characeae of Southeastern United States,
W74-04879 5A

Taxonomy, Distribution and Ecology of the Genus Sesarma (Crustacea, Decapoda, Grapsidae) in Eastern North America, with Special Reference to Florida,
W74-04880 2I

SYSTEMS ANALYSIS
Systems Analysis: A Decision-making Tool for Arid Land Development,
W74-05223 6A

Models for Environmental Pollution Control.
W74-05386 5B

Systems Analysis for Environmental Pollution Control,
W74-05387 5G

TAPPING (WATER MAINS)
Tapping, Disinfection, and Inspection of Water Mains,
W74-05011 5F

TEMPERATURE
Sea Surface Temperature and Salinity Conditions in 1969 at Agate Beach and Yaquina Bay, Oregon,
W74-04935 2L

Limnology of Two Re-Regulation Reservoirs in Czechoslovakia,
W74-05073 5C

Stomatal Responses to Changes in Temperature at Increasing Water Stress,
W74-05366 2I

Soil-Water-Potentials Depending on Temperature, (In German),
W74-05372 2G

Moisture and Temperature Regimes in the Southern-Taiga Soils of Central Siberia and Habitat Conditions for Crops, (In Russian),
W74-05373 3F

TENNESSEE
A Study of the Reliability of Continuous Water Quality Monitoring,
W74-04982 5A

Detailed Project Report, Dyersburg, Tennessee, Finley Street Area.
W74-04989 4A

TENSILE STRESS
The Effect of Impurities on the Mechanical Properties of Ice Single Crystals,
W74-04914 2C

TERTIARY TREATMENT
Kraft Pulping Effluent Treatment and Reuse - State of the Art,
W74-05110 5D

TESTING PROCEDURES
Multipurpose Medium for Use with Pseudomonas Species,
W74-04906 5A

TEXAS
Ground-Water Resources of the San Antonio Area, Texas: A Progress Report on Studies, 1960-1964,
W74-04992 4B

Cathodic Protection, Control of External Casing Corrosion,
W74-05085 8G

Flood Stages and Discharges for Small Streams in Texas,
W74-05107 2E

Reliability and Economic Optimization for Urban Return Flows Management,
W74-05333 5B

TEXTILES
Water and Waste Water Problems in Modern Textile Finishing Plants (Wasser- und Abwasserprobleme im modernen Textilveredlungsbetrieb),
W74-05255 5D

THERMAL PLUMES
Workbook of Thermal Plume Prediction: Volume 1, Submerged Discharge,
W74-05111 5B

THERMAL POLLUTION
Thermal Effects on Biological Production in a Pond,
W74-04861 5C

Workbook of Thermal Plume Prediction: Volume 1, Submerged Discharge,
W74-05111 5B

Hot Problem Solved by Aerated Lagoon,
W74-05280 5D

THERMAL POWERPLANTS
Water and the Energy Crisis,
W74-04912 6D

Energy and the Environment--Electric Power.
W74-05330 5B

THERMAL STRATIFICATION
Effect of an Upstream Reservoir on the Stratification Conditions in Slapy Reservoir,
W74-05069 5C

Limnology of Two Re-Regulation Reservoirs in Czechoslovakia,
W74-05073 5C

THERMAL STRESS
Ultimate Upper Lethal Temperature of Atlantic Salmon Salmo salar L.,
W74-04869 5C

THERMOKARST
Fundamentals of Karst Science. Volume 2 (Osnovy karstovedeniya. TOM II),
W74-05017 2F

THERMOPHILIC CONDITIONS
Population Changes in Enteric Bacteria and Other Microorganisms During Aerobic Thermophilic Windrow Composting,
W74-04908 5D

THIN LAYER CHROMATOGRAPHY
Selective Chromatographic Separation of Uranium(VI) on Deae-Cellulose Layers in Dilute Acetic Acid Media,
W74-04864 5A

THYROXINE
The Effect of Thyroxine and Triiodothyronine on Bacterial Growth,
W74-04891 5A

TIDAL CURRENTS
Currents Around the Hawaiian Islands. A Study of Coastal Currents in Respect to Sewage Disposal,
W74-04925 5B

Some Modern Approaches to Beach Studies,
W74-04930 2J

Field Experience in Estuaries,
W74-04956 2L

TIDAL EFFECTS
Coastal Processes,
W74-04951 2L

Tidal Dynamics in Estuaries. Part I: Estuaries of Rectangular Section,
W74-04952 2L

Tidal Dynamics in Estuaries. Part II: Real Estuaries,
W74-04953 2L

Salinity Intrusion in Estuaries,
W74-04954 2L

The Internal Velocity Field in Breaking Waves,
W74-04960 2J

TIDAL POWERPLANTS
Potentials of Tidal Power on the North Atlantic Coast in Canada and United States,
W74-04972 2L

TIDAL PRISM
Salinity Intrusion in Estuaries,
W74-04954 2L

TIDAL STREAMS
Tidal Stream Development and Its Effect on the Distribution of the American Oyster,
W74-04878 5C

TIDES
CERC Bulletin and Summary Report of Research Progress for Fiscal Years 1965-66.
W74-04926 2L

Coastal Circulation Near Kakinada Bay During Monsoon Period,
W74-04941 2L

Tidal and Salinity Model Practice,
W74-04958 2L

Seasonal Changes in Beaches of the North Atlantic Coast of the United States,
W74-04963 2J

The Ash Wednesday East Coast Storm, March 5-8, 1962. A Hindcast of Events, Causes, and Effects,
W74-04969 2J

Numerical Prediction on Typhoon Tide in Tokyo Bay,
W74-04971 2L

On the Position of Tidal Barriers in Northumberland Strait,
W74-05140 2E

TILE DRAINAGE
Removal of Nitrogen from Tile Drainage-A Summary Report, Bio-Engineering Aspects of Agricultural Drainage, San Joaquin Valley, California.
W74-05228 5D

Nutrients from Tile Drainage Systems, Bio-Engineering Aspects of Agricultural Drainage, San Joaquin Valley, California.
W74-05229 5B

TILLAGE
The Effect of Different Tillage Methods on the Physical Properties of Soil, (In Russian),
W74-05378 2G

TIOGA COUNTY (NEW YORK)
Riverbanks Improvement Program,
W74-05234 6F

TOMBIGBEE RIVER (MISS
Acker Lake Landslide, Monroe County, Mississippi,
W74-04862 2J

TOXICITY
The Biological Pathway of Zinc (Zn-65) in Freshwater Fish and its Alteration by Heavy Metals,
W74-05201 5C

Organomercurials in the Environment,
W74-05248 5B

Isolation and Chemical Identification of Toxic Components of Kraft Mill Wastes,
W74-05270 5A

Contribution to the General Pathology of Endocardial Reactions: Toxic Endocardial Lesions in Lower Vertebrates (Carp), (In German),
W74-05308 5C

Effects of Red Mud on Marine Animals,
W74-05325 5C

Study of Metabolic Regulations Between Cyanophyceae and Fish (In Russian),
W74-05327 5C

TOXICITY (YEAST)
Toxicity of Sod Podzolic Soils Lysimetric Solutions, (In Russian),
W74-05375 2G

TRACE ELEMENTS
Determination of Eight Metals in the International Biological Standard by Flameless Atomic-Absorption Spectrometry,
W74-04868 5A

Report on the Composition of Oil from the Region of New Hydrocarbon Upwelling in the Santa Barbara Channel,
W74-04919 5A

Migration of Elements in River Waters (Migratsiya elementov v rechnykh vodakh),
W74-05022 5B

Basic Patterns in the Distribution of Chemical Elements in Deep-Sea Sediments of the Black Sea (Osnovnyye zakonomernosti raspredeleniya khimicheskikh elementov v tolshche glubokovodnykh osadkov Chernogo morya),
W74-05023 5B

Chemical Aspects of Underground Water,
W74-05080 4B

Possible Cause of Formation of Horizontal Hydrogeochemical Zonality of Groundwater in Central Kazakhstan (O vozmozhnoy prichine vozniknoveniya gorizontal'noy gidrogeokhimicheskoy zonal'nosti podzemnykh vod v Tsentral'nom Kazakhstane) ,
W74-05147 2F

Effect of Excess Moisture on Trace Element Distribution in Soils of Liningrad Oblast (O vliyanii izbytochnogo uvlazhneniya na raspredeleniye mickroelementov v pochvakh Leningradskoy oblasti),
W74-05148 2G

Inductively Coupled Plasma-Optical Emission Analytical Spectrometry. A Compact Facility for Trace Analysis of Solutions,
W74-05309 5A

Effect of Trace Elements on the Water Regimen, the Decorative Qualities and the Seed Yield of Some Ornamental Plants, (In Russian),
W74-05345 5C

TRACE LEVELS
Paraffin Hydrocarbon Patterns in Petroleum-Polluted Mussels,
W74-05326 5A

TRACE ORGANIC ANALYSIS
Trace Soluable Organic Compounds in Potable Water Supplies,
W74-04855 5A

TRACKING TECHNIQUES
Cesium-137 Soil Inventory of a Tagged Liriodendron Forest 1962 and 1969,
W74-05193 5B

TRADEWATER RIVER BASIN (KY)
Regression Techniques for Estimation of Sulfate in Streams Draining an Area Affected by Coal Mining,
W74-05125 5B

TRAINING
Selection, Handling, and Protection of Downhole Materials: A Practical Approach,
W74-05102 8G

TRANSMISSIVITY
Pulse-Test Response of a Two-Zone Reservoir,
W74-05077 4B

How Areal Heterogeneities Affect Pulse-Test Results,
W74-05092 8G

Wellbore Transmissibility from Afterflow-Dominated Pressure Buildup Data,
W74-05101 8G

TRANSPIRATION
Transpiration Measurement in Pines Using Tritiated Water as a Tracer,
W74-05197 5B

Transpiration of the Main Tree Species on the Bol'-shoi Ushkanii Island (The Baikal Lake) in Different Seasons (In Russian),
W74-05364 2D

TREATMENT FACILITIES
Combined Sewer Overflow for The Hudson River Conference,
W74-05112 5D

Effluent -- Fibre Recovery -- Water Savings: A Method to Analyse and Tackle the Problems,
W74-05257 5D

Quick Brown Fox Doesn't Trip Over Thilmany's Effluent Anymore,
W74-05258 5D

Survey of Residual Waste Water Treatment (Ueberblick ueber die Behandlung der Restabwaesser),
W74-05261 5D

Installation of Waste Water and Sludge Treatment Facilities at the Arjomari-Prioux Paper Mill at Rives-Sur-Fure (Installation de traitement des eaux residuaires et des boues de la papeterie Arjomari Prioux a Rives-sur-Fure).
W74-05264 5D

How Much Will Cleanup Cost,
W74-05268 5D

Economic Impact of Pollution Abatement on the Sulfite Segment of the U.S. Pulp and Paper Industry,
W74-05277 5D

Regional Wastewater Management Systems,
W74-05389 5D

TREE SPECIES
Transpiration of the Main Tree Species on the Bol'-shoi Ushkanii Island (The Baikal Lake) in Different Seasons (In Russian),
W74-05364 2D

TREE TYPES (ROOT SYSTEMS)
Phytomass Reserves in Some Types of Tundra from the Northern Ob River Related Area, (In Russian),
W74-04940 2I

TRIAZINE PESTICIDES
Atrazine, Propachlor, and Diazinon Residues on Small Agricultural Watersheds,
W74-05295 5B

TRICKLING FILTERS
Biological and Nonbiological Processes for Removing Dissolved Organic Substances from Residual Waste Waters (Biologische und nichtbiologische Verfahren zur Entfernung geloester organischer Substanzen aus Restabwaessern),
W74-05262 5D

TRIIODOTHYRONINE
The Effect of Thyroxine and Triiodothyronine on Bacterial Growth,
W74-04891 5A

TRITIATED WATER
Transpiration Measurement in Pines Using Tritiated Water as a Tracer,
W74-05197 5B

TRITIUM
Tritium Movement in an Old-Field Ecosystem Determined Experimentally,
W74-05198 5B

TROPHIC LEVEL
Trophic Relations of Aquatic Insects,
W74-05062 5C

TROPHIC LEVELS
An Analysis of Mercurials in the Elephant Butte Ecosystem,
W74-04859 5B

TROUT
Low pH Levels Wipe Out Salmon and Trout Populations in Southernmost Norway,
W74-05356 5C

TSUNAMIS
Selection and Design of a Bore Generator for the Hilo Harbor Tsunami Model. Hydraulic Model Investigation,
W74-04946 8B

TUBIFICIDS
Relationships Between Phosphorus-32 Accumulation in Algae, Bacteria, and Tubificids,
W74-05206 5C

TUBULAR MERCURY-GRAPHITE ELECTRODES
Anodic Stripping Voltammetry of Zinc in Seawater with a Tubular Mercury-Graphite Electrode,
W74-05305 5A

TULSA (OKLAHOMA)
Regional Environmental Pollution Study: Inventory and Analysis.
W74-05239 5B

TUNDRA
Phytomass Reserves in Some Types of Tundra from the Northern Ob River Related Area, (In Russian),
W74-04940 2I

TURBIDITY CURRENTS
Sedimentary Processes on the Continental Slope Off New England,
W74-05043 2J

TURBULENCE
Longshore Currents Generated by Obliquely Incident Sea Waves,
W74-04943 2E

TURBULENT BOUNDARY LAYERS
Application of Boundary-Layer Theory to Dispersion in Nonstratified Two-Dimensional Estuaries,
W74-04983 2L

TURKEY
The Summer Fallow System,
W74-05215 3F

Evaluation of the Hydrological Aspects of the Agricultural Studies in Arid and Semi-Arid Zones of Turkey,
W74-05219 3F

Erosion Control and Vegetative Cover Under Dryland Conditions in Turkey,
W74-05220 3F

Wheat Production Problems and Potentials on Drylands,
W74-05221 3F

Land and Water Resource Development for Crop Production in Turkey,
W74-05222 3F

The Arid Zone Problems in Turkey,
W74-05225 3F

TURKEY (ANATOLIA)
Influence of Parent Material and Slope Exposure on Properties of Soils Related to Erodibility in North Central Anatolia,
W74-05066 2J

Vegetation of Central Anatolia and its Ecology,
W74-05214 4A

TWO-ZONE RESERVOIR
Pulse-Test Response of a Two-Zone Reservoir,
W74-05077 4B

TYPHOONS
Numerical Prediction on Typhoon Tide in Tokyo Bay,
W74-04971 2L

UDELL HILLS (MICH)
Lake Michigan Snow Squalls Increase Annual Precipitation in the Udell Hills,
W74-05124 2B

ULTRASTRUCTURE
Ultrastructure of the Green Alga Dichotomosiphon tuberosus with Special Reference to the Occurrence of Striated Tubules in the Chloroplast,
W74-04881 5C

The Ultrastructure of an Alloparasitic Red Alga Choreocolax Polysiphoniae,
W74-05299 5C

UNDERGROUND STORAGE
Controlled Solution Mining in Massive Salt,
W74-05103 8B

UNITED ARAB REPUBLIC (EL-HAMMAN-EGYPT)
Economic Aspects of a Nuclear Desalination Agro-Industrial Project in the United Arab Republic,
W74-05382 3A

UNITED STATES
Collaboration of the U.S.S.R. and the U.S.A. in the Field of Hydraulic Engineering and Land Reclamation,
W74-05076 6E

Large Rivers of the United States.,
W74-05138 2E

Pollution -- Yesterday, Today, and Tomorrow,
W74-05272 5D

UNIVERSAL SOIL LOSS EQUATION
Comparative Costs of Erosion and Sediment Control, Construction Activities.
W74-04986 4D

UPWELLING
Sea Surface Temperature and Salinity Conditions in 1969 at Agate Beach and Yaquina Bay, Oregon,
W74-04935 2L

URAL RIVER
The Soils of the Ural River Zone in the Gurev Region and their Improvements During Irrigation, (In Russian),
W74-05205 2G

URANIUM
Selective Chromatographic Separation of Uranium(VI) on Deae-Cellulose Layers in Dilute Acetic Acid Media,
W74-04864 5A

Fluorimetric Method for the Determination of Uranium in Natural Waters,
W74-05240 5A

URBAN DRAINAGE
The Application of Binary Tree Structures to Hydrologic Network Simulators,
W74-04852 4A

URBAN HYDROLOGY
Water Resources as a Basis for Comprehensive Planning and Development in the Christina River Basin,
W74-04988 6B

URBAN RENEWAL
Detailed Project Report, Dyersburg, Tennessee, Finley Street Area.
W74-04989 4A

URBAN RUNOFF
Combined Sewer Overflow for The Hudson River Conference,
W74-05112 5D

Reliability and Economic Optimization for Urban Return Flows Management,
W74-05333 5B

URBAN SOCIOLOGY
Regional Environmental Pollution Study: Inventory and Analysis.
W74-05239 5B

UREASE
Urease Activity of Enterobacteriaceae: Which Medium to Choose,
W74-04888 5A

URINE
The Quantitative Determination of Chromium in Urine by Flameless Atomic Absorption Spectroscopy,
W74-05291 5A

USNEA TILLANDSIOIDES
Some Aspects of the Role of Usnic Acid in Forest Ecology,
W74-04979 5B

USNIC ACID
Some Aspects of the Role of Usnic Acid in Forest Ecology,
W74-04979 5B

USSR
Comparative Characteristics of Desert Soils of USSR and Australia, (In Russian),
W74-04998 2G

Comparative Study of the Physicochemical Properties of Meliorated and Non-Meliorated Soils at the Mugan Experimental Melioration Station, (In Russian),
W74-05037 2G

Collaboration of the U.S.S.R. and the U.S.A. in the Field of Hydraulic Engineering and Land Reclamation,
W74-05076 6E

Problems in Hydrologic Forecasting (Voprosy gidrologicheskikh prognozov).
W74-05141 4A

20-24 Year Cycle in the March of Atmospheric Precipitation and Its Relation to Air Circulation Patterns (Tsikl 20-24 goda v khode atmosfernykh osadkov i yego svyza' s osobennostyami atmosfernoy tsirkulyatsii),
W74-05149 2B

USSR (AMUR BASIN)
Contribution to Knowledge of Mayflies of the Amur Basin: I. Imagines (Ephemeroptera:Ephemerellidae), (In Russian),
W74-05380 2I

Contribution to Knowledge of Mayflies (Ephemeroptera) of the Amur Basin: II. Imagines (Rhithrogena, Heptagenia), (In Russian),
W74-05381 2I

USSR (BELORUSSIA)
Effect of Hydrometeorological Conditions on Time of Ice Formation on Rivers in the Baltic Sea Region and Belorussia (Vliyaniye gidrometeorologicheskikh uslovity na sroki poyavleniya l'da na rekakh Pribaltiki i Belorussii),
W74-05143 2C

USSR (BIRYUSA RIVER)
Moisture and Temperature Regimes in the Southern-Taiga Soils of Central Siberia and Habitat Conditions for Crops, (In Russian),
W74-05373 3F

USSR (BLACK SEA)
Basic Patterns in the Distribution of Chemical Elements in Deep-Sea Sediments of the Black Sea (Osnovnyye zakonomernosti raspredeleniya khimicheskikh elementov v tolshche glubokovodnykh osadkov Chernogo morya),
W74-05023 5B

USSR (BLACK SEA BASIN)
Migration of Elements in River Waters (Migratsiya elementov v rechnykh vodakh),
W74-05022 5B

USSR (CAUCASUS MOUNTAINS)
Characteristics of Organic-Matter Distribution in Calcareous Sediments of the Caspian Sea and in Mesozoic Carbonate Rocks of the Southeastern Caucasus (Osobennosti raspredeleniya organicheskogo veshchestva v izvestkovykh osadkakh Kaspiyskogo morya i karbonatnykh porodakh mezozoya yugo-vostochnogo Kavkaza),
W74-05021 5B

USSR (CENTRAL URALS)
The Hydrometeorological and Antierosion Effect of Forests in the Eastern Part of the Central Urals (In Russian),
W74-05353 4D

USSR (CRIMEA)
Variations in the Height of Wave Run-Up on a Sandy Beach,
W74-05025 2L

USSR (DANUBE RIVER)
Long-Range Forecast of Duration of Ice Phenomena on the Danube River (Dolgosrochnyy prognoz prodolzhitel'nosti ledovykh yavleniy na r. Dunaye),
W74-05142 2C

USSR (DNIESTER RIVER)
Forecasting Maximum Flood Levels on the Dniester River (Prognoz maksimal'nykh pavodochnykh uroveny vody r. Dnestra),
W74-05145 4A

USSR (GOLODNAYA STEPPE)
Experiment in Rapid Leaching of Saline Soils in the Golodnaya Steppe (Opyt uskorennoy promyvki zasolennykh pochv Golodnoy stepi),
W74-05018 3C

USSR (GUREO REGION)
The Soils of the Ural River Zone in the Gurev Region and their Improvements During Irrigation, (In Russian),
W74-05205 2G

USSR (KAZAKH HILLS)
The Effect of Meteorological Factors on Combustibility of Ground Cover and a New Method of Forecasting Fire Danger in Forests of the Kazakh Hills (In Russian),
W74-05352 4A

USSR (KAZAKHSTAN)
Possible Cause of Formation of Horizontal Hydrogeochemical Zonality of Groundwater in Central Kazakhstan (O vozmozhnoy prichine vozniknoveniya gorizontal'noy gidrogeokhimicheskoy zonal'nosti podzemnykh vod v Tsentral'nom Kazakhstane) ,
W74-05147 2F

Dense Local Plantations of Pines in the Northern Kazakhstan (In Russian),
W74-05354 4A

USSR (KRASNOZNAMENSKII)
Some Data on Secondary Salinization of Krasnoznamenskii Irrigated Massif, (In Russian),
W74-05376 3F

USSR (KUBAN)
Combined Rearing of the Pike-Perch Lucioperca lucioperca (L.) and Roach Rutilus rutilus Heckeli (Nordm.) in Liman Fish Farms of Kuban, (In Russian),
W74-04923 8I

USSR (LAKE BAIKAL)
Transpiration of the Main Tree Species on the Bol'-shoi Ushkanii Island (The Baikal Lake) in Different Seasons (In Russian),
W74-05364 2D

USSR (LENINGRAD OBLAST)
Effect of Excess Moisture on Trace Element Distribution in Soils of Liningrad Oblast (O vliyanii izbytochnogo uvlazhneniya na raspredeleniye mickroelementov v pochvakh Leningradskoy oblasti),
W74-05148 2G

USSR (LITHUANIA)
The Problem of the Microclimate of the Dry Pine Forest, (In Russian),
W74-05350 2I

USSR (MOLDAVIA)
Some Characteristics of Fluoride Migration in Groundwater of Moldavia (O nekotorykh osobennostyakh migratsii ftora v podzemnykh vodakh Moldavii),
W74-05016 2K

USSR (MOSCOW REGION)
Water Regime of Sod Podzolic Soils Under Spruce Forests of Different Ages, (In Russian),
W74-05343 4A

Water Properties and Water Regime of Sod Podzolic Soils and Means of their Improvement (In Russian),
W74-05370 3F

USSR (MURGAB OASIS)
Experience of Meadow Soil Desalination in Murgab Oasis (In Russian),
W74-05368 3C

USSR (OB RIVER)
Phytomass Reserves in Some Types of Tundra from the Northern Ob River Related Area, (In Russian),
W74-04940 2I

USSR (PAVLODAR PRIIRTYSHYE)
Results of a Second Study of Wind-Eroded Soils in the Pavlodar Priirtyshye (In Russian),
W74-05369 2J

USSR (SEA OF AZOV)
Longshore Currents and Sediment Motion in the Coastal Zone of the Sea of Azov,
W74-05024 2L

USSR (TADZHIKISTAN-NORTHERN CAUSASUS)
Water-Holding Capacity of Coarse and Medium Loesslike Loams (O vodouderzhivayushchey sposobnosti legkikh i srednikh lessovidnykh suglinkov),
W74-05020 2G

USSR (UKRAINE)
Effect of Dibbling of Winter Fallow on Hydrophysical Properties of Frozen Soil and on Erosion Processes (Vliyaniye lunkovaniya zyabi na vodno-fizicheskiye svoystva merzloy pochvy i protsessy erozii),
W74-05019 2G

UTAH
Computer Simulation of the Hydrologic and Salinity Flow Systems Within the Bear River Basin,
W74-04860 5B

The Economic Efficiency of Inter-Basin Agricultural Water Transfers in Utah: A Mathematical Programming Approach,

TECHNISCHE UNIVERSITAET, DARMSTADT (WEST GERMANY). WASSER- UND ABWASSERFORSCHUNGESSTELLE.
Survey of Residual Waste Water Treatment (Ueberblick ueber die Behandlung der Restabwaesser),
W74-05261 5D

TECHNISCHE UNIVERSITAET, DARMSTADT (WEST GERMANY). WASSER- UND ABWASSERFORSCHUNGSSTELLE.
Biological and Nonbiological Processes for Removing Dissolved Organic Substances from Residual Waste Waters (Biologische und nichtbiologische Verfahren zur Entfernung geloester organischer Substanzen aus Restabwaessern),
W74-05262 5D

Fundamental View of the Closed Water Circuit (Der geschlossene Wasserkreislauf in grundsaetzlicher Betrachtung),
W74-05282 5D

TECHNISCHE UNIVERSITAET, HANOVER (WEST GERMANY). INSTITUT FUER BODENKUNDE.
Soil-Water-Potentials Depending on Temperature, (In German),
W74-05372 2G

TEMPLE UNIV., PHILADELPHIA, PA. DEPT. OF MATHEMATICS.
Bayesian Analysis of a Bivariate Normal Distribution with Incomplete Observations,
W74-04893 7C

TENNESSEE UNIV., KNOXVILLE. WATER RESOURCES RESEARCH CENTER.
A Study of the Reliability of Continuous Water Quality Monitoring,
W74-04982 5A

TETRA TECH, INC., PASADENA, CALIF.
Edge Bores,
W74-04948 8B

Coastal Movable Bed Scale Model Technology,
W74-04949 2J

TEXAS A AND M UNIV., COLLEGE STATION. DEPT. OF BIOLOGY.
Annotated Bibliography on Effects of Salinity and Salinity Changes on Life in Coastal Waters,
W74-05031 2J

TEXAS A AND M UNIV., COLLEGE STATION. DEPT. OF CIVIL ENGINEERING.
Experimental Studies of Beach Scour Due to Wave Action,
W74-05035 2J

TEXAS PARKS AND WILDLIFE DEPT. AUSTIN.
An Evaluation of the Effects of Estuarine Engineering Projects,
W74-05038 5B

TEXAS STATE DEPT. OF HEALTH, AUSTIN. DIV. OF WASTEWATER TECHNOLOGY AND SURVEILLANCE.
Ecology of Daphnia in Stabilization Ponds,
W74-05048 5D

TEXAS UNIV., AUSTIN.
Controlled Solution Mining in Massive Salt,
W74-05103 8B

TEXAS UNIV., AUSTIN. DEPT. OF CIVIL ENGINEERING.
Cnoidal Waves in Shallow Water,
W74-04959 2L

TEXAS UNIV., AUSTIN. DEPT. OF ZOOLOGY.
The Production of Hydrogen Peroxide by Blue-Green Algae: A Survey,
W74-04882 5C

TEXAS UNIV., SAN ANTONIO. DIV. OF ENVIRONMENTAL STUDIES.
Reliability and Economic Optimization for Urban Return Flows Management,
W74-05333 5B

TORONTO UNIV. (ONTARIO). DEPT. OF CHEMICAL ENGINEERING.
Effluent-Free Bleached Kraft Pulp Mill: Present State of Development,
W74-05275 5D

TRENT UNIV., PETERBOROUGH (ONTARIO). DEPT. OF BIOLOGY.
A Sampler for the Chemical Analysis of Freshwaters Using Evacuated Tubes,
W74-05321 7B

TRW SYSTEMS GROUP, REDONDO BEACH, CALIF.
Development and Flight Test of the Multichannel Ocean Color Sensor (MOCS),
W74-05026 7B

TULSA CITY-COUNTY HEALTH DEPT., OKLA.
Regional Environmental Pollution Study: Inventory and Analysis.
W74-05239 5B

UNION CARBIDE CORP., TONAWANDA, N.Y.
Waste Water Treatment: Using Pure Oxygen for Secondary Treatment,
W74-05247 5D

UNIVERSIDAD NACIONAL DE TUCUMAN (ARGENTINA).
Hydric Regime of an Argiudol (In Spanish),
W74-05324 2G

UNIVERSITY OF SOUTHERN MISSISSIPPI, HATTIESBURG. DEPT. OF ECONOMICS.
A Treatise on Centralized Management of Water Resources,
W74-05030 6E

UTAH CENTER FOR WATER RESOURCES RESEARCH, LOGAN.
Computer Simulation of the Hydrologic and Salinity Flow Systems Within the Bear River Basin,
W74-04860 5B

UTAH WATER RESEARCH LAB., LOGAN.
Biological Response to Detergent and Nondetergent Phosphorus in Sewage - Part I,
W74-04901 5C

VEB ZELLSTOFF- UND PAPIERKOMBINAT TREBSEN (EAST GERMANY).
Experiences with Chemical Pre-Purification of Kraft Mill Waste Water with Magnesium Chloride Brine (Potassium Extraction Liquor) (Erfahrungen bei der chemischen Vorreinigung von Sulfatzellstoffabwasser mit Magnesiumchloridsole (Kaliendlauge),
W74-05283 5D

VILLANOVA UNIV., PA. DEPT. OF CHEMISTRY.
New Ultraviolet Ratio Spectrophotometric System for the Determination of Trace Amounts of Phenolic Compounds,
W74-05244 5A

VIRGINIA COMMONWEALTH UNIV., RICHMOND.
Some Ecological Considerations in Locating a Nuclear-Powered Electrical Generating Facility on the North Anna River, Virginia,
W74-05212 5C

VIRGINIA INST. OF MARINE SCIENCE, GLOUCESTER POINT.
Water Quality Models and Aquatic Ecosystems Status, Problems and Perspectives,
W74-05393 5B

VSESOYUZNYI NAUCHNO-ISSLEDOVATELSKII INSTITUT GIDROTEKHNIKI I MELIORATSII, MOSCOW (USSR).
Experiment in Rapid Leaching of Saline Soils in the Golodnaya Steppe (Opyt uskorennoy promyvki zasolennykh pochv Golodnoy stepi),
W74-05018 3C

VYZKUMNY USTAV ORGANICKYCH SYNTEZ, PARDUBICE (CZECHOSLOVAKIA).
Identification of Aromatic Nitriles by Reaction Paper Chromatography,
W74-04865 5A

WALLA WALLA COLL., COLLEGE PLACE, WASH. DEPT. OF BIOLOGY.
Polychlorinated Biphenyls in the Seastar Acanthaster Planci,
W74-05301 5A

WARSAW UNIV. (POLAND). ZOOLOGICAL INST.
Spatial Differentiation and Changes in Time of Zoomicrobenthos in Three Masurian Lakes,
W74-05050 5C

WASHINGTON STATE DEPT. OF FISHERIES, OLYMPIA.
Hood Canal Pond Revision,
W74-05157 8I

WASHINGTON STATE UNIV., PULLMAN. COLL. OF ENGINEERING RESEARCH DIV.
The Role of Paper Mill Additives as Potential Stream Pollutants -- Development of Nuclear Techniques,
W74-05287 5A

WASHINGTON UNIV., SEATTLE. COLL. OF FISHERIES.
Uptake of Molybdenum Marked with Mo-99, by the Biota of Fern Lake, Washington, in a Laboratory and Field Experiment,
W74-05210 5C

WASHINGTON UNIV., SEATTLE. DEPT. OF AERONAUTICS AND ASTRONAUTICS.
Dimensionless Strength Parameters for Floating Ice Sheets,
W74-05162 2C

A Mechanical Model of Rafting,
W74-05163 2C

WASHINGTON UNIV., SEATTLE. DIV. OF MARINE RESOURCES.
A Relation Between the Potential Energy Produced by Ridging and the Mechanical Work Required to Deform Pack Ice,
W74-05160 2C

Redistribution Functions and Their Yield Surfaces in a Plastic Theory of Pack Ice Deformation,
W74-05161 2C

On the Calculation of the Roughness Parameter of Sea Ice,
W74-05164 2C

Similarity Constants in the Stratified Planetary Boundary Layer,
W74-05166 2E

WASHINGTON UNIV., SEATTLE. INST. OF FOREST PRODUCTS.
Wood Waste Reuse in Controlled Release Pesticides,
W74-05286 5D

WATER RESEARCH LAB., LOGAN.
The Economic Efficiency of Inter-Basin Agricultural Water Transfers in Utah: A Mathematical Programming Approach,
W74-05385 4A

WATER RESOURCES BOARD OF ENGLAND AND WALES.
Groundwater Resources of the Vale of Clwyd.

CENTERS OF COMPETENCE AND THEIR SUBJECT COVERAGE

- Ground and surface water hydrology at the Water Resources Division of the U. S. Geological Survey, U. S. Department of the Interior.
- Metropolitan water resources planning and management at the Center for Urban and Regional Studies of University of North Carolina.
- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Center of the University of Wisconsin.
- Eutrophication at the Water Resources Center of the University of Wisconsin.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.
- Water well construction technology at the National Water Well Association.
- Water-related aspects of nuclear radiation and safety at the Oak Ridge National Laboratory.
- Water resource aspects of the pulp and paper industry at the Institute of Paper Chemistry.

Supported by the Environmental Protection Agency in cooperation with WRSIC

- Effect on water quality of irrigation return flows at the Department of Agricultural Engineering of Colorado State University.
- Agricultural livestock waste at East Central State College, Oklahoma.

SELECTED WATER RESOURCES ABSTRACTS

VOLUME 7, NUMBER 11
JUNE 1, 1974

W74-05401 -- W74-05950

SELECTED WATER RESOURCES ABSTRACTS is published semimonthly for the Water Resources Scientific Information Center (WRSIC) by the National Technical Information Service (NTIS), U.S. Department of Commerce. NTIS was established September 2, 1970, as a new primary operating unit under the Assistant Secretary of Commerce for Science and Technology to improve public access to the many products and services of the Department. Information services for Federal scientific and technical report literature previously provided by the Clearinghouse for Federal Scientific and Technical Information are now provided by NTIS.

SELECTED WATER RESOURCES ABSTRACTS is available to Federal agencies, contractors, or grantees in water resources upon request to: Manager, Water Resources Scientific Information Center, Office of Water Resources Research, U.S. Department of the Interior, Washington, D. C. 20240.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from the National Technical Information Service. Annual subscription is $45 (domestic), $56.25 (foreign). Certain documents abstracted in this journal can be purchased from the NTIS at prices indicated in the entry. Prepayment is required.

SELECTED
WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center,
Office of Water Resources Research, U.S. Department of the Interior

VOLUME 7, NUMBER 11
JUNE 1, 1974

W74-05401 -- W74-05950

The Secretary of the U. S. Department of the Interior has determined that the publication of this periodical is necessary in the transaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1978.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifiers which are listed in the **Water Resources Thesaurus.** Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT PRESENTLY IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency. A directory of the Centers appears on inside back cover.

Supplementary documentation is being secured from established discipline-oriented abstracting and indexing services. Currently an arrangement is in effect whereby the BioScience Information Service of Biological Abstracts supplies WRSIC with relevant references from the several subject areas of interest to our users. In addition to Biological Abstracts, references are acquired from Bioresearch Index which are without abstracts and therefore also appear abstractless in SWRA. Similar arrangements with other producers of abstracts are contemplated as planned augmentation of the information base.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Resources Research and other Federal water resources agencies with which the

Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

CONTENTS

FOREWORD_____iii

SUBJECT FIELDS AND GROUPS

(Use Edge Index on back cover to Locate Subject Fields and Indexes in the journal.)

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Non-Water Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

2. WATER CYCLE

2A. General

SIMULATION OF THE HYDROLOGY OF UNGAGED WATERSHEDS,
Purdue Univ., Lafayette, Ind. Dept. of Agricultural Engineering.
L. F. Huggins, J. R. Burney, P. S. Kundu, and E. J. Monke.
Available from the National Technical Information Service as PB-229 670, $3.75 in paper copy, $1.45 in microfiche. Purdue University Water Resources Research Center Technical Report No. 38, 1973. 70 p, 20 fig, 3 tab, 6 ref, 1 append. OWRR B-016-IND(2).

Descriptors: *Watersheds(Basins), *Hydrologic models, *Simulation analysis, *Rainfall-runoff relationships, *Small watersheds, *Overland flow, Roughness, Roughness coefficient, Hydrographs, Surface waters, Topography, Slopes, Hydraulics, Mathematical models, Runoff, Physical properties, *Distribution patterns.
Identifiers: Distributed analysis, Distributed parameters, Watershed modelling, Power spectral analysis, Surface roughness, Overload flow.

A watershed model is developed capable of predicting hydrologic behavior of a natural watershed for which data concerning historical relationships between rainfall and runoff events are unavailable. The computer program used to implement the model together with sample data and its output is given in an appendix. The model uses a distributed analysis approach and involves the subdivision of a catchment into a grid of small elemental areas, the mathematical characterization or modelling of the various physical processes occurring within each element and the numerical integration of the responses from each watershed element into a comprehensive description of not only the discharge at the outlet, but of the complete hydrologic response of every element of which the catchment is composed. The primary advantages of the distributed watershed model are its potential for increased accuracy due to its inherent capability to evaluate spatially variable factors within a watershed and its comprehensive description of the total watershed behavior. This latter advantage is of increasing importance in providing a means of evaluating the potential environmental effects of alternate programs for resource development. The primary disadvantage of distributed models is the greatly increased computational effort required to utilize them.

EVAPORATION, INFILTRATION AND RAINFALL-RUNOFF PROCESSES IN URBAN WATERSHEDS,
Purdue Univ., Lafayette, Ind. Water Resources Research Center.
A. Hossain, J. W. Delleur, and R. A. Rao.
Available from the National Technical Information Service as PB-229 642, $4.00 in paper copy, $1.45 in microfiche. Technical Report No. 41, 1974. 46 p, 35 fig, 13 tab, 41 ref. OWRR B-022-IND(2).

Descriptors: *Urban runoff, *Urban hydrology, *Evaporation, *Infiltration rates, *Rainfall-runoff relationships, *Precipitation excess, Urban drainage, Consumptive use, Energy budget, Evaporation pans, Latent heat, Water balance, Infiltration, Antecedent precipitation, Retention, Soil properties, Unit hydrographs, Model studies, Mathematical models.
Identifiers: van Bavel's evaporation formula, Kohler's evaporation formula, Blaney-Criddle evaporation formula, Blaney-Morin evaporation formula, MIT watershed model, Minnesota watershed model, Holtan watershed model, Multicapacity Basin Accounting Model, Antecedent Retention Index Model, Instantaneous Unit Hydrograph, Non-Linear Deterministic Model, Quasi-Linear Model.

Most rainfall-runoff models use rainfall excess as the input. Testing methods for estimating the rainfall excess, evaluating linear and nonlinear systems models for urbanizing areas, and developing a model of the rainfall excess-direct runoff transfer were the objectives of the study. For evaporation, the van Bavel formula was the best model, however if the meteorological data were unavailable, the Blaney-Morin gave good results. The constant diffusivity form of the unsteady flow equation for the flow in porous media was solved making use of the linear systems approach, and an impulse response function was obtained for the relative soil moisture change. Five models were examined as to their application for urban watersheds. The Antecedent Retention Index Model gave the best estimate of the total rainfall excess and the MIT Model gave the best prediction of the time distribution. A quasi-linear model of the rainfall-runoff transfer was developed. The model was tested by predicting the direct runoff of an urban watershed, from which data were not used for the calibration and the performance was found to be very satisfactory. The data for the study were obtained from eleven urban watersheds in Indiana, Texas, and Illinois.
W74-05405

DETERMINATION OF DISCHARGE-FREQUENCY RELATIONSHIPS UTILIZING NON-LINEAR HYDROGRAPHS AND A MODIFIED RATIONAL FORMULA,
Kansas Water Resources Research Inst., Manhattan.
R. L. Smith, K. E. Larson, and M. G. Berry.
Available from the National Technical Information Service as PB-230 036, $11.25 in paper copy, $1.45 in microfiche. KWRRI Contribution No. 126. September 1973. 165 p, 30 fig, 24 ref. OWRR B-022-KAN(1). 14-31-0001-3283.

Descriptors: *Hydrographs, *Kansas, *Hydrograph analysis, *Flood frequency, Rainfall intensity, Watersheds(Basins), Methodology, Storms.
Identifiers: *Non-linear hydrographs, *Frequency-equivalent storms.

A new methodology for calculating flood frequency relationships is presented. Input data requirements are the normal watershed parameters of length, slope and area plus the point rainfall intensity-duration-frequency curve for the specified geographic location. Initial testing on 60 Kansas basins ranging in size from less than one square mile to more than 1,000 square miles gave results which compared favorably with other available techniques. The methodology provides for the determination of a frequency-equivalent storm having a uniform rainfall excess intensity. This storm is converted to a triangular hydrograph having a frequency-equivalent peak discharge and a base length equal to the time of concentration plus the storm duration. The overall approach has been termed the Frequency-Equivalent Non-Linear Hydrograph (FENLH) method. In Kansas, the rainfall excess intensity of the frequency-equivalent storms was found to follow a log normal distribution. For a given basin, the percentage attenuation in peak flow due to the effect of basin storage was found to be essentially constant at frequency-equivalent conditions. Both the slope (variance) of the probability distribution of log X and the time of concentration are directly related to the rate of change in the watershed resistance parameter (BN). BN is a function of the Reynolds number, but its rate of change is also influenced by basin loss characteristics. A procedure for adapting the method to the determination of flood frequency relations in urban basins is presented. Procedures to be followed in utilizing the FENLH hydrograph parameters in reconstituting variable intensity storms are described.
W74-05406

AN EMPIRICAL MATHEMATICAL MODEL OF AN INTERCONNECTED WATERSHED SYSTEM,
Pennsylvania State Univ., University Park. Dept. of Industrial Engineering.
D. L. Raphael, and B. M. Tallman.
Available from the National Technical Information Service as PB-229 830 $7.00 in paper copy, $1.45 in microfiche. Institute for Research on Land and Water Resources, Pennsylvania State University, research project technical completion report, February, 1974. 72 p, 15 fig, 18 tab, 6 ref. OWRR A-022-PA(1). 14-31-0001-4038.

Descriptors: *Watersheds(Basins), *Mathematical models, Evapotranspiration, Hydrographs, Model studies, Seepage, Flow, *Forecasting, *Hydrograph analysis, *Rainfall-runoff relationships, *Algorithms.
Identifiers: *Response surface mapping, Absorbing sectors, Seepage loss.

The problem of prediction of surface flow hydrographs resulting from excess rainfall was investigated by applying Response Surface Mapping techniques to estimate parameters as a function of time. An empirical model with two absorbing sectors (surface flow and the sun of the evapotranspiration and seepage loss) was developed and applied to a complex system of interconnected watersheds using hypothetical data and parameters. The model techniques were also applied to predict a surface flow hydrograph for a single real world watershed.
W74-05543

SURFACE-GROUNDWATER RELATIONSHIPS IN CENTRAL MONGOLIA (VZAIMOSVYAZ' POVERKHNOSTNYKH I GRUNTOVYKH VOD V TSENTRAL'NOY MONGOLII),
Proizvodstvennyi i Nauchno-Issledovatelskii Institut po Inzhenernym Izyskaniyam v Stroitelstve Gosstroya, Moscow (USSR).
A. F. Krashnikov.
Akademiya Nauk SSSR Izvestiya, Seriya Geograficheskaya, No 5, p 92-96, September-October 1973. 1 fig, 1 tab, 8 ref.

Descriptors: *Surface-groundwater relationships, *Water resources, *Surface waters, *Groundwater, Streamflow, Runoff, Rainfall-runoff relationships, Mountains, Estimating.
Identifiers: *USSR(Mongolia).

Characteristics of surface waters and groundwater in Central Mongolia are examined, and estimates are made of water resources of the area. Large supplies of water, both surface and ground, are concentrated in the Hangayn-Henteyn (Kentei Shan) folded mountain region. Natural groundwater resources drained by the hydrographic network of rivers in the region are 6.6 cu km/yr, which is 30% of the local streamflow estimated at 22.1 cu km/yr. The Selenge and Onon basins, which occupy 58% of the area of the Hangayn-Henteyn fold mountains, contain three-fourths (4.68 cu m/yr) of the groundwater resources of this most water-abundant region of Mongolia. The groundwater contribution to streamflow in the Hangayn-Henteyn mountains, including the Selenge (Arctic Ocean) basin, the Pacific Ocean basin, and closed basins of Central Asia is tabulated. WATERSHED MODELS: TOOLS IN PLANNING LAND MANAGEMENT FOR WATER AND POLLUTION CONTROL,
Agricultural Research Service, Beltsville, Md. Hydrograph Lab.
C. B. England.

Journal of Soil and Water Conservation, (Vol 28), p 36-38, January-February 1973. 4 chart, 2 illus, 4 ref.

Descriptors: *Water, *Land management, *Hydrologic data, *Model studies, *Hydrologic models, Water utilization, Evapotranspiration control, Non-structural alternatives, Watershed management, Zoning, Watersheds(Basins), Agricultural watersheds, Groundwater basins, Analytical techniques, Research and development.

All phases of the hydrologic cycle are involved in the disposition of wastes on agricultural land. Infiltration, storage, movement of water in the soil, surface detention and runoff, evapo-transpiration, groundwater recharge and channel processes all influence the fate of any material applied to a soil. Because of the complex interdisciplinary nature of predicting watershed performance, comprehensive mathematical models have been developed in agricultural hydrology. Through manipulation of parameters controlling the prediction computations, quick and efficient evaluation of potential effects of management alternatives can be made, thus optimizing the design of control measures to achieve a specified result. These models can provide aid to understanding and predicting water movements within agricultural watersheds. Since they can be employed to determine the movement of dissolved or suspended pollutants, if they are constructed in such a way that land management effects are predictable, they can become a useful tool in pollution control planning. (Ritchie-Florida)

DEVELOPING SIMULATION MODELS,
McMaster Univ., Hamilton (Ontario). Dept. of Civil Engineering and Engineering Mechanics.
W. James.
Water Resources Research, Vol 8, No 6, p 1590-1592, December, 1972. 3 fig, 1 ref.

Descriptors: *Mathematical models, *Computer models, *Systems analysis, *Model studies, *Simulation analysis, Operations research, Synthetic hydrology, Scheduling.

Simulation models are commonly resolved in time and space beyond the integrity of available field observations. Input data are judged accordingly, and, ultimately, expensive simulation models coexist with inadequate data bases. Such manipulation is necessary in sensitivity analysis, but a compromise between data collection and model extrapolation must be found. The rationale for the systematic development of a simulation model and the concomitant data collection program is presented and should be useful for managing difficult simulation studies. SPECTRAL ANALYSIS AND ITS APPLICATION TO HYDROLOGIC TIME SERIES OF LOWER OHIO TRIBUTARIES,
Purdue Univ., Lafayette, Ind.
H. L. Shahabian.
Available from National Technical Information Service as PB-230 241, $9.75 in paper copy, $1.45 in microfiche. Thesis, 1973, 118 p, 24 fig, 10 tab, 22 ref, append. OWRR-B-036-IND(3).

Descriptors: *Rainfall-runoff relationships, *Simulation analysis, *Stochastic processes, *Time series analysis, Precipitation, Rain, Runoff, Hydrographs, Evapotranspiration, Probability, Mathematical studies, *Ohio River, *Regression analysis.
Identifiers: *Spectral analysis.

Objectives were to develop different models for the rainfall and runoff sequences and of rainfall-runoff processes for several watershed tributaries to the Ohio River. The models developed for the monthly data followed two different approaches, namely, spectral analysis and the ARIMA (autoregressive integrated moving average) procedure. Spectral analysis is applied to develop a model for the monthly runoff sequence. The autoregressive scheme is adequate to represent the normalized standardized monthly sequences. A comparison of the spectral and parametric estimation of the model parameters is performed for their respective generating capabilities. The monthly rainfalls are analyzed using the same spectral technique. The normalized standardized series do not differ sensibly from a white noise or uncorrelated random variables. The rainfall-runoff relationship is analyzed by the cross-spectral technique and it is found that the linear system for the two series does not explain the relationship adequately.

MODELS OF SPRING RUNOFF FORMATION AND PROBLEMS IN THEIR USE FOR FORECASTING THE FLOOD HYDROGRAPH,
Gidrometerologicheskii Institut, Leningrad (USSR).
A. P. Zhidikov, A. G. Levin, N. S. Nechayeva, and Ye. G. Popov.
Soviet Hydrology: Selected Papers, No 3, p 240-249, 1972. 3 fig, 5 ref. Translation of Transactions of the Hydrometeorological Research Center of the USSR (Trudy GMTs), No 81, p 33-45, 1972.

Descriptors: Model studies, *Flood forecasting, *Hydrograph analysis, *Snowmelt, *Runoff, Water equivalent, Hydrologic budget, Inflow, Discharge(Water), Variability, Equations.
Identifiers: *USSR(Oka River), Nomograms, *USSR(Neya River).

Although several models have been developed in the USSR in the last 15-20 years for computation of individual items in the hydrologic budget and of the hydrograph as a whole, they have not found wide application in hydrologic computations and forecasts. A method is investigated for forecasting a flood hydrograph by computing snowmelt at the outlet gaging station of a drainage basin, 4,000 to 6,000 sq km in area. Models were tested on initial data for the Oka River upstream from Orel and for the Neya River upstream from Buslayevo village for 1949-65 and 1936-65, respectively. The drainage area of the Oka River is 4,900 sq km; it is well drained by a ravine-gully network and is unwooded. The drainage area of the Neya River is 5,700 sq km and is 80% covered by forests. The flood hydrograph was derived by computer according to programs designed for 4 modifications of the models. In one modification the rate of snowmelt was computed for open and wooded parts of the basins from snowmelt coefficients. In three modifications the rate of snowmelt in the forest was computed from the snowmelt coefficient, and the rate of snowmelt in the open, from formulas. These modifications further took into account the regulation of temporary meltwater runoff on the basin surface. (Josefson-USGS)

2B. Precipitation

MANUAL FOR ESTIMATION OF PROBABLE MAXIMUM PRECIPITATION.
World Meteorological Organization, Geneva (Switzerland).
Operational Hydrology Report No 1, 1973. 190 p, 2 append.

Descriptors: *Probable maximum precipitation, *Estimating, Meteorology, Cloud physics, Statistical methods, Depth-area-duration analysis, *Precipitation intensity, Weather data, *Publications, *Climatic data.

Procedures for estimating probable precipitation (PMP) cannot be standardized as they vary with amount and quality of data available, basin size and location, basin and regional topography, storm types producing extreme precipitation, and climate. This manual discusses procedures that have been found generally applicable in the middle latitudes for basin sizes up to about 50,000 sq km in orographic and nonorographic regions. The examples given cover estimates for specific basins and generalized estimates, and include PMP estimates for thunderstorms, general storms, and tropical storms. All procedures described except one are based on the meteorological, or traditional, approach. The one exception is a statistical procedure. The traditional approach consists essentially of moisture maximization and transposition of observed storms. Wind maximization is sometimes used. Storm transposition involves adjustments for elevation, moisture-inflow barriers, and distance from the moisture source. These adjustments are founded on hypothetical storm models. A variation of the traditional approach is the use of an orographic computation model in mountainous regions. Methods are described for determining the seasonal variation and chronological and areal distribution of PMP. Tables of precipitable water in a saturated pseudoadiabatic atmosphere are included for making various adjustments involving atmospheric moisture. Also included are world record and near-record rainfalls that may be used for making rough assessments of derived PMP estimates. (Knapp-USGS)
W74-05524

DESCRIPTION OF PRECIPITATION CYCLES IN THE USSR AND THEIR RELATION TO GENERAL CIRCULATION CYCLES,
O. A. Drozdov, and A. S. Grigor'yeva.
Soviet Hydrology: Selected Papers, No 1, p 57-64, 1972. 4 fig, 6 tab, 6 ref. Translated from Third All-Union Conference on General Circulation of the Atmosphere (Trudy 3-ey Vsesoyuznoy konferentsii po obshchey tsirkulyatsii atmosfery), p 87-96, 1972.

Descriptors: *Precipitation(Atmospheric), *Air circulation, *Cycles, Correlation analysis, Seasonal.
Identifiers: *USSR.

Statistical structure of time series of atmospheric precipitation over large areas of the USSR was investigated for territorial distribution of cycles and its correlation with similar air circulation characteristics. Data of 77 stations for 1891-1960 for cold (November-March) and warm (April-October) periods of the year were used. Cycles at 4 stations (Leningrad, Tbilisi, Barnaul, and Nerchinskiy Zavod) were investigated for 1830-90. A 2- to 3-year cycle is generally observed in both precipitation and circulation. A 6- to 7-year cycle is encountered more often in precipitation than in circulation (particularly during the warm period), while 8- to 9- and 10- to 11-year cycles frequently associated with circulation are replaced by 9- to 10- and 12- to 13-year precipitation cycles. A 14- to 15-year cycle is observed in both precipitation and circulation, and cycles of 19 and 20 to 22 years are better defined in precipitation than in circulation characteristics. A cycle of 60 to 80 years is as-

sociated with both circulation and precipitation. Cycles are more clearly defined in the amount of precipitation. The contribution of cycle components to long-period variations in the amount of precipitation is significant. (Josefson-USGS)
W74-05566

RELATIONSHIP BETWEEN CLIMATOLOGICAL VALUES OF AIR TEMPERATURE AND AMOUNT OF PRECIPITATION,
K. V. Pyatygina.
Soviet Hydrology: Selected Papers, No 1, p 18-21, 1972. 1 fig, 1 tab, 7 ref. Translated from Voyeykov Main Geophysical Observatory (Trudy GGO), No 273, p 61-65, 1972.

Descriptors: *Climatology, *Meteorology, *Precipitation(Atmospheric), *Air temperature, Correlation analysis.
Identifiers: *USSR.

Correlations between long-period average temperature and precipitation values and between their anomalies reflect the general mechanism of climate formation. Since the coefficients of correlation between temperature and precipitation anomalies were found to be much lower than between long-period average values of these meteorological elements, it may be assumed that the results obtained for normal values are conclusive in this mechanism of climate formation, while those obtained for anomalies are a peculiar manifestation of this mechanism. This factor must be considered in developing a climatic theory. (Josefson-USGS)
W74-05568

CLIMATIC DESCRIPTION OF DEW IN THE EUROPEAN USSR,
Main Geophysical Observatory, Leningrad (USSR).
V. N. Karpenko.
Soviet Hydrology: Selected Papers, No 3, p 264-268, 1972. 3 fig, 1 tab, 3 ref. Translation of Transactions of the Voyeykov Main Geophysical Observatory (Trudy GGO), No 288, p 150-155, 1972.

Descriptors: Climatology, *Dew, *Air temperature, Maps, *Time series analysis, *Climatic data.
Identifiers: *European USSR, *Isolines.

Average dates of the beginning and end of dew formation from 1959 to 1965 were calculated from results of daily observations at 100 stations in different regions of European Russia. To estimate the reliability of the 7-year series, dates of the beginning and end of dew formation were calculated for 11 stations for a 20-year period (1950-69). Relations were established between average dates of dew formation and average daily air temperature on the data of dew formation and between duration of the period of possible dew formation and dates of its beginning and end. In northern and northwestern regions dew begins to form as air temperature crosses 7-8 deg C. In Estonia, Latvia, Belorussia, most of the Ukraine, and central and eastern regions of European Russia, it forms at 5-6 deg C. In Lithuania, Moldavia, and the Stavropol' and Krasnodar Territories dew begins to form when air temperature crosses 3-4 deg C. The greatest difference between the average dates of dew formation observed over a 20-year period and the calculated dates is 4 days, and that between the dates of the end of dew formation is 6 days. The difference between the actual and calculated duration of the period of possible dew formation is 9 days. In northern regions, the average duration of the period of possible dew formation is approximately 120 days, beginning in late May and ending during the last 10 days of September. The duration of this period increases southward, reaching 240 days in the southern Ukraine and Northern Caucasus. Average duration of the possible period of dew formation and dates of its beginning and end are tabulated for 11 stations in European Russia, and average duration of the possible period of dew formation and dates of its beginning and end are mapped. (Josefson-USGS)
W74-05839

AMOUNT OF DEW IN THE USSR, ACCORDING TO A DEW RECORDER,
Main Geophysical Observatory, Leningrad (USSR).
V. N. Karpenko.
Soviet Hydrology: Selected Papers, No 3, p 260-263, 1972. 1 fig, 1 tab, 12 ref. Translation of Transactions of the Voyeykov Main Geophysical Observatory (Trudy GGO), No 288, p 144-149, 1972.

Descriptors: *Dew, Measurement, Climatic data, Distribution patterns.
Identifiers: *USSR, *Dew gages.

To exclude the effects of varying duration of the warm season at different latitudes, the amounts of dew in the USSR were calculated for a 5-month period from May through September. The largest amount of dew, about 4-6 mm, is observed in the Baltic States, the Pskov, Novgorod, and Leningrad Oblasts, Belorussia, the Upper Volga Region, and in the western Ukraine. The amount of dew decreases markedly from northwest to southeast in European Russia. In the Central Russian Uplands, the southeastern Ukraine, the Stavropol' and Krasnodar Territories, and in Rostov Oblast, the amounts of dew measured by a dew gage in May-September are about 2-3 mm. Dew values decrease to 1 mm over most of the lower Volga Region but increase considerably on the Black Sea coast of the Caucasus and in foothills of the Northern Caucasus. The amount of dew in Tadzhikistan in May-September is 2 mm. In the Lena Valley of the Yakutsk ASSR, dew values reach 2-3 mm. In Chita, Irkutsk, Ulan-Ude, and Krasnoyarsk dew yields 3-4 mm of water. Dew in the Maritime Territory in May-September yields as much as 5-6 mm of water. In most cases, average daily dew precipitation in the USSR is about 0.1 mm. Annual dew precipitation in the Baltic States, Belorussia, most of the Ukraine, and in central regions of European Russia is 8-12 mm, and in Upper and Central Volga Regions and Stavropol' and Krasnodar Territories it is 6-8 mm. North of 60 deg N and in the Lower Volga Region dew values decrease to 3-5 mm. The geographic distribution of dew in May-September over the USSR (in mm) is mapped, and the average number of days with dew per year is tabulated for 34 stations in the country. (Josefson-USGS)
W74-05840

PROBLEM OF DETERMINING PRECIPITATION FALLING ON MOUNTAIN SLOPES,
Main Geophysical Observatory, Leningrad (USSR).
L. R. Struzer.
Soviet Hydrology: Selected Papers, No 2, p 129-142, 1972. 5 fig, 5 tab, 1 ref. Translation of Transactions of the Voyeykov Main Geophysical Observatory (Trudy GGO), No 280, p 134-149, 1972.

Descriptors: *Precipitation(Atmospheric), *Rainfall disposition, *Raindrops, *Slopes, *Mountains, Valleys, Watersheds(Divides), Winds, Rain gages, Equations.

Quantitative criteria were established for dimensions of a mountain basin, and methods were developed for computing differences in precipitation occurring on opposite slopes of a mountain valley. Three different planes in space were investigated: horizontal, sloping, and perpendicular to the trajectory of drops. The quantitative estimates obtained can be used in piedmont regions and in areas with smooth, streamlined landforms. In high mountain areas, the degree of deviation of the trajectories of the actual field from rectilinear and parallel precipitation trajectories must be considered. This deviation will determine the degree of representativeness of precipitation stations. Intersection of rain trajectories by planes of different slope and orientation is diagrammed, and maximum difference in amounts of precipitation received by right and left slopes of a valley is tabulated. ON A MODEL OF THE ICE BREAKUP PROCESS,
L. G. Shulyakovskiy.
Soviet Hydrology: Selected Papers, No 1, p 21-27, 1972. 2 tab, 4 ref. Translated from Transactions of Hydrometeorological Center (Trudy GMTs), No 49, p 3-10, 1972.

Descriptors: *Model studies, *Ice breakup, *Ice, *Ice cover, *Ice-water interfaces, Stress, Pressure, Friction, Velocity, Roughness(Hydraulic), Roughness coefficient, Equations.
Identifiers: *USSR.

Stresses in ice cover are produced by: (1) friction between water and the bottom surface of ice cover; (2) friction between air and the top surface of ice cover; (3) pressure of water flow on the submerged face of ice cover; (4) pressure of air flow on the ice face projecting above the water surface; and (5) wave motion. The main force producing stresses in ice cover which result in ice breakup is friction between water flow and the bottom surface of ice cover. Stresses arising in ice cover can be tensile, compressive, shearing, or bending. The predominant type of stress depends on the tortuosity of the river. Tables show the magnitude of friction forces between water and the bottom face of ice cover and between wind and the top face of ice cover, in sq m of ice surface. (Josefson-USGS)

METHOD FOR SUPPRESSING THE FORMATION OF ICE IN NATURAL OR MAN-MADE BODIES OF WATER,
Dow Chemical Co., Midland, Mich. (assignee).
J. S. Best.
U.S. Patent No. 3,768,264, 4 p, 3 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 915, No 5, p 1616, October 30, 1973.

Descriptors: *Patents, Ice, *Heat transfer, *Heat exchangers, Equipment, Iced lakes, *Navigation.
Identifiers: *Ice formation suppression.

A method for suppressing the formation of ice in natural or man-made bodies of water such as lakes, rivers, sound, straits, bays, shipping canals, shipping locks, harbors, and the like is described. The method is particularly useful in areas where ice breakers or the like cannot be efficiently operated. The method provides for direct replacement of heat lost to the atmosphere during the winter season by the use of heat transfer means such as permanent heat transfer apparatus located in and/or adjacent the sides of canals or rivers to prevent natural bridging of ice formation in them or by use of a traveling heat exchanger placed in a barge, scow, or similar vessel. The method provides for the direct replacement of heat lost to the atmosphere from a body of water during cold seasonal days when the air temperature is below that necessary for the formation of an ice cover. This replacement of heat results in maintaining the upper layer of water in the body of water just above freezing. This invention takes advantage of low level thermal energy sources by using liquid compositions to store heat near the body of water. (Sinha - OEIS)

WATER RELEASE FROM THE BASE OF ACTIVE GLACIERS,
Windsor Univ. (Ontario). Dept. of Geology.
M. Stupavsky, and C. P. Gravenor.
Geological Society of America Bulletin, Vol 85, No 3, p 433-436, March 1974. 1 fig, 5 tab, 13 ref.

Descriptors: *Glaciers, Movement, *Till, Muds, Melt water, Melting, Glaciology, Slurries, Glaciohydrology, *Canada.
Identifiers: *Port Stanley Till(Can), *Magnetite.

From work done to demonstrate the plausibility of a water layer at the base of active glaciers, it is concluded that the rapid movement of some glaciers and ice sheets can only be explained by the reduction of shear stress of the ice caused by a layer or pockets of water. To test this idea, ground-up till was mixed with varying amounts of water and the alignment of the particles was measured in the Earth's magnetic field. The laboratory results were compared with those obtained from the Port Stanley Till. At the time of deposition of the Port Stanley Till, the material under the ice consisted of a slurry composed of rock and mineral particles with about 28% to 47% water by weight. The long axes of the coarse magnetite retain an alignment which was developed by ice movement either englacially or in the slurry at the ice-till interface. The fine magnetite fraction is free to rotate during deposition. The slurry at the base of the ice acts as a lubricant. This study substantiates the concept of basal sliding caused by continuous release of water from the base of active glaciers. (Knapp-USGS)

ESTIMATE OF THE ACCURACY OF DETERMINATION OF SNOW COVER CHARACTERISTICS AND RECOMMENDATIONS ON THE RATIONALIZATION OF THE SNOW MEASUREMENT NETWORK,
Main Geophysical Observatory, Leningrad (USSR).
I. D. Kopanev.
Soviet Hydrology: Selected Papers, No 2, p 122-128, 1972. 6 tab, 10 ref. Translation of Transactions of the Voyeykov Main Geophysical Observatory (Trudy GGO), No 280, p 54-63, 1972.

Descriptors: *Estimating, *Snow cover, *Snow surveys, *Measurement, Depth.
Identifiers: *USSR, Snow courses, Snow density.

Errors in the determination of average snow depth and density were computed from results of experimental snow surveys performed at a selected network of stations at the time of maximum snow accumulation and at the start of snowmelt. To estimate errors, data were analyzed separately for open and sheltered areas. The absolute error in snow depth measurement is small, even in the field, and does not exceed 4 cm, except in southern zones of European Russia where snow cover is unstable and in Kazakhstan where the error exceeds 5 cm. For similar snow survey parameters, the error is much smaller in forested areas than in the open. For most zones in Siberia the absolute error is approximately of the same order of magnitude in both field and forest. Absolute and relative errors depend on the number of measurement points, the error decreasing as the number of points and length of snow course increase. Snow depth interpolation errors are greater for sheltered than for open areas. The interpolation error increases markedly in both open and sheltered areas as the time interval between snow measurements increases. The interpolation error of snow depth and, correspondingly, of the density of the snow measurement network are determined by space-time variations of snow cover. On the basis of computations, recommendations can be made with respect to selection of optimum snow survey parameters and conduct of snow observations at stations and posts of the hydrometeorological network in lowland regions of the USSR. (Josefson-USGS)

AIRBORNE MEASUREMENT OF SNOW-WATER EQUIVALENT USING NATURAL GAMMA RADIATION OVER SOUTHERN ONTARIO, 1972-1973,
Geological Survey of Canada, Ottawa (Ontario).
H. S. Loijens, and R. L. Grasty.
Canada Department of the Environment, Ottawa Inland Waters Directorate Scientific Series No 34, 1973. 21 p, 13 fig, 16 tab, 25 ref, append.

Descriptors: *Remote sensing, *Snowpacks, *Snow surveys, *Water equivalent, *Canada, Nuclear moisture meters, *Gamma rays, Radioisotopes, Calibrations, Measurement.

To test airborne measurement of snow-water equivalent, four gamma-ray spectrometer surveys each 1,850 km in length, were carried out using a sodium iodide detector assembly, flown at 150 m altitude, in an aircraft fitted with a radar altimeter and Doppler navigation system. Total radioactivity, potassium, and thorium were recorded digitally on magnetic tape and were used to calculate an average snow-water equivalent for 16 km sections along each flight line. The results were compared with the measurements from 40 snow courses and 10 experimental courses established along the flight lines. Soil moisture corrections from measurements at selected sites were found to decrease the calculated snow-water equivalent by an average of 2.6 cm for potassium and 3.3 cm for total count. Background radiation measurements were also important because of large fluctuations in atmospheric bismuth-214. An average absolute difference of 0.9 cm water equivalent was found between the potassium airborne and the ground results for the experimental courses. This indicated that the potassium channel can be used without making prior calibration flights at different altitudes to determine the air absorption coefficient. A larger variation of 2.1 cm between the total count and ground results suggests that calibration flights are necessary. (Knapp-USGS)

Water Resources Research, Vol 8, No 4, p 1092-1095, August, 1972. 4 fig, 2 tab, 10 ref.

Descriptors: *Evapotranspiration, *Stomata, Water requirements, Soil-water-plant relationships, Consumptive use, Hydrologic cycle, Soil moisture, Moisture, Water conservation, Canopy, Cover crops, *Evaporation.

Various aspects of stomatal control of evaporation and their practical significance have been considered in a recent exchange of opinions. Some considerable departures from potential evaporation rates observed under conditions of generous soil water supply are described. These departures occurred on days of high potential rates and represented reductions of up to about 20% from levels that might otherwise have been expected under the prevailing atmospheric conditions. However, the reductions represented only a few percent of the seasonal or annual evaporation. Accompanying symptoms of plant moisture stress are discussed. (Skogerboe-Colorado State)

THE ACTUAL EVAPOTRANSPIRATION OF FOUR FOREST STANDS IN THE EAST OF FRANCE, (IN FRENCH),
Centre National de Recherches Forestieres, Nancy (France). Station de Sylviculture et de Production.
G. Aussenac.
Ann Sci For. Vol 29, No 3, p 369-389. 1972. Illus. English summary.
Identifiers: Abies-grandis, Advection, Carpinus-betulus, Diurnal, Equations, *Evapotranspiration, Fagus-sylvatica, *Forests, *France, Moisture, Nocturnal, Picea-abies, Pinus-sylvestris, Rainfall, Soil, Transpiration, *Pine, *Spruce, *Fir, *Hardwood.

The actual evapotranspiration (ETR) of 4 forest stands, a Scotch pine (Pinus sylvestris), a spruce (Picea abies), a fir (Abies grandis) and a hardwood stand (Fagus sylvatica + Carpinus betulus) was studied in 1967-1969. These high forests had a regular structure and are located upon a marbled and lixiviated brown soil with a seasonal watersheet (at 60 cm depth). Evapotranspiration was estimated between periods at which soil moisture reaches the field capacity (start and end of the vegetation period). The basic equation of the method is: ETR = Pi - D plus or minus delta N, Pi = incident rainfall on the stand, D = lateral and vertical drainage, delta N = level fluctuations of the perched watersheet. Diurnal and nocturnal watertable fluctuations measured in piezometric pipes allowed drainage estimations. The spruce stand evapotranspirated less than the other stands. Different age, different structure and different environmental conditions (advection) caused differences in ETR among the stands. Rainfall interception must also be considered, as the net loss of water can be quite different according to the species and the stand structure. The actual evapotranspiration is higher or equal to the potential evapotranspiration calculated with the Boucher equation. Under temperate climates and soils closed stands of similar age and structure have almost the same actual evapotranspiration.--Copyright 1973, Biological Abstracts, Inc.

METAMORPHOSIS OF A RIVER--A COMPARISON OF THE MISSISSIPPI RIVER BEFORE AND AFTER CUTOFFS,
Army Engineer District, Vicksburg, Miss. Potamology Section.
B. R. Winkley.
Available from the National Technical Information Service as PB-229 648, $5.50 in paper copy, $1.45 in microfiche. Mississippi State University Water Resources Research Institute Publication, 1973. 42 p, 28 fig, 10 tab, 13 ref. OWRR A-999-MISS(9b).

Descriptors: *Mississippi River, *Channel morphology, Channel improvement, Alluvial channels, Sediment transport, Sedimentation, Meanders, Braiding.

The efficiency of the Mississippi River is lower than it was in 1950 and the river is possibly even less efficient than it was as a natural unimproved river. Structures have been placed according to the availability of funds and wherever the need was the greatest. Therefore, even if a perfect plan of alignment and improvement had been designed, it could not have been executed. The geometry of the river has changed fast in response to the numerous cutoffs. The result is a poorly aligned river that has lost flood efficiency, proper sediment transport, and possibly some navigation control. The long-term response of the river is the important factor to consider. Raising levees may only help to aggravate the present trend; alignment, flow condition, and sediment transport and storage, as well as a deep navigation channel, must also be considered. (Knapp-USGS)

CAESIUM-137 AS A WATER MOVEMENT TRACER IN THE ST GEORGE'S CHANNEL,
Institute of Oceanographic Sciences, Birkenhead (England).
T. R. S. Wilson.
Nature, Vol 248, No 5444, p 125-127, March 8, 1974. 1 fig, 2 tab, 8 ref.

Descriptors: *Tracers, *Currents(Water), *Ocean circulation, Ocean currents, Oceanography, Hydrography, Path of pollutants, Dissolved solids.
Identifiers: *St George's Channel, *Irish Sea.

The distribution of Cs-137 in the St George's Channel of the Irish Sea system shows that the residual (nontidal) flow is slightly lower than indirect estimates suggest. The constribution of turbulent mixing to the transport of dissolved and particulate material in these waters may also be calculated directly from cesium measurements. (Knapp-USGS)

TWO-DIMENSIONAL ANALYSIS OF BACKWATER AT BRIDGES,
University of South Florida, Tampa. Dept. of Structures, Materials, Fluids.
J. T. Franques.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 100, No HY3, Paper 10403, p 379-392, March 1974. 7 fig, 11 ref, append.

Descriptors: *Backwater, *Mathematical models, *Open channel flow, *Finite element analysis, Flow around objects, *Bridges, Steady flow, Model studies.

A two-space-dimensional mathematical model computes steady flow distributions and water levels near contractions in natural waterways. The two-dimensional model provides a theoretical basis for such one-dimensional concepts as expansion losses by accounting for all losses by friction along properly located two-dimensional streamlines. The finite element solution algorithm locates these streamlines and integrates energy loss due to friction along them. Stagnation zones downstream from contractions can be predicted and located. A necessary condition for separation is that the velocity head at the point of separation exceeds head loss due to friction along some possible path for a free streamline. The absence of separation which is associated with scouring currents along the downstream side of bridge approach embankments can be predicted where the necessary condition is not satisfied. (Knapp-USGS)

URBAN FLOOD FREQUENCY CHARACTERISTICS,
Espey, Huston and Associates, Inc., Austin, Tex.
W. H. Espey, Jr., and D. E. Winslow.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 100, No HY2, Paper 10352, p 279-293, February 1974. 5 fig, 9 tab, 19 ref, append.

Descriptors: *Urban hydrology, *Storm runoff, *Peak discharge, Urban runoff, Flood recurrence interval, Rainfall-runoff relationships, *Texas, Infiltration, Runoff, Urbanization, *Flood frequency, Flood forecasting.
Identifiers: *Urban watersheds.

On four urban watersheds located in Texas, urbanization has significantly increased peak discharge as much as 200%. However, data on the Waller Creek watershed (Austin, Tex.) and Wilbarger Creek watershed (near Austin, Tex.) suggest that the effects of urbanization on peak discharge decreases above a recurrence interval of 2-5 years. Data from 27 urban watersheds in Texas, combined with 33 urban watersheds located in Virginia, Maryland, Delaware, Illinois, and Mississippi, form the basis for the derivation of empirical flood frequency equations for small urban watersheds. These equations relate the flood discharge for recurrence intervals of 2.33 yr, 5 yr, 10 yr, 20 yr, and 50 yr to physiographic, urban, and climatic factors. The significant urban factors are the impervious cover and a channel urbanization factor. (Knapp-USGS)
W74-05738

FORM AND FLUVIAL PROCESSES IN ALLUVIAL STREAM CHANNELS,
Purdue Univ., Lafayette, Ind.
E. A. Keller.
Available from National Technical Information Service as PB-230 242, $10.00 in paper copy, $1.45 in microfiche. Ph.D. Thesis 1973, 124 p, 55 fig, 2 tab, 67 ref. OWRR-A-022-IND(3).

Descriptors: *Geomorphology, *Streambeds, *Meanders, *Channel morphology, *Channel beds, Stream bottoms, Rills, Alluvial channel, Channel width, Drainage density.
Identifiers: *Fluvial processes, Strahler stream order, Channel bed forms, Channel morphometry, Riffles, Pools, Bifurcation ratio.

The problem was to define quantitatively and qualitatively, for alluvial channels, selected aspects of form and fluvial processes which contribute to the development of fluvial systems. The relationship between the number of links and segments of natural drainage networks was found to be restricted to a narrow envelope. Theoretically, within this envelope a family of curves with the general form $y = 2x - (2n - 1)$ is defined, wherein y is the number of links, x is the number of segments, and n is the Strahler stream order defined for n = 2, 3, 4, 5. Comparison with more than 100 natural drainage networks indicated that these curves delineate threshold and boundary conditions and may be used to predict stream order. A five-stage model is proposed to explain the development of alluvial channels. The model is based upon channel morphology, channel morphometry, and qualitative conclusion based on numerous field observations. A generic classification is suggested, which permits hierarchical ranking of common bed forms in straight, sinuous, and meandering alluvial channels. Two major subdivisions: channel-forming and channel-altering bed forms are proposed.

FLOOD PROFILES AND INUNDATED AREAS ALONG THE LOWER NISQUALLY RIVER, WASHINGTON,
Geological Survey, Tacoma, Wash.
J. E. Cummans.
Water-Resources Investigations 42-73, 1974. 9 p, 2 fig.

Descriptors: *Floods, *Washington, *Flood profiles, Flood recurrence interval, Flood data, Flood discharge, Flood stages.
Identifiers: *Nisqually River(Wash).

Flood profiles covering the reach from near the river mouth to river mile 6.4 were developed in a 2-year field study (1970-72) of the Nisqually River, Washington. The main channel of the reach will convey without overflow discharges as large as about 21,000 cfs, which have a 6-year recurrence interval. The banks in some areas will be overtopped at a flow of 25,500 cfs, which has a 13-year recurrence interval. The areas where overbank flooding will first occur and water-surface profiles of a 3.4-year and 100-year flood were determined for six flood-profile stations. The largest flood for which data are available was that of December 1933; the approximate area that would be presently inundated by such a flood is shown. Alder and La Grand Reservoirs can reduce the magnitude of lower annual flood peaks downstream to some extent. (Knapp-USGS)

ANNUAL COMPILATION AND ANALYSIS OF HYDROLOGIC DATA FOR DEEP CREEK, COLORADO RIVER BASIN, TEXAS, 1971,
Geological Survey, Austin, Tex.
J. N. Lee.
Open-file report (Texas District), July 1973. 76 p, 2 fig, 3 tab.

Descriptors: *Hydrologic data, *Data collections, *Texas, *Rainfall-runoff relationships, *Stream gages, Streamflow, Reservoirs, Flood control.
Identifiers: *Colorado River basin(Tex).

The U.S. Soil Conservation Service is actively engaged in the installation of flood- and soil-erosion reducing measures in Texas. Hydrologic investigations of these small watersheds were begun by the Geological Survey in 1951 and are now being made in 12 areas. This report is concerned with the watershed above the Geological Survey stream-gaging stations on Deep Creek in the Colorado River basin. Six floodwater-retarding structures have been completed in the watershed. They have a combined total capacity of 5,660 acre-feet and regulate floodflow from 19.9 square miles (45%) of the drainage area above the stream-gaging station. Instruments to collect rainfall, runoff, and storage data in the Deep Creek study area consist of a network of rain gages, staff gages on four pools, continuous water-stage recorders on the other two pools, and recording stream-gaging stations. During the 1971 water year, the weighted-mean rainfall over the Deep Creek portion of the study area was 32.71 inches and over the Dry Prong Deep Creek portion of the study area it was 24.85 inches. The rainfall over the Deep Creek portion was 18% above the long-term average rainfall of 27.74 inches at Brownwood. For the 1971 water year, three storms were selected for detailed computation at each recording site. These computations include detailed time breakdown of rainfall and discharge. Hydrographs and mass curves are drawn for illustrations. The storms selected occurred July 26, 27, and August 1, 1971. A summary of rainfall-runoff data for the storms is shown. (Knapp-USGS)

FLOOD HAZARD ANALYSES, SAND CREEK, CITY OF COLORADO SPRINGS, AND EL PASO COUNTY.
Soil Conservation Service, Portland, Oreg.
Prepared in cooperation with Colorado Water Conservation Board, July 1973. 18 p, 38 exhibit, 4 photo, 57 map, 1 tab.

Descriptors: *Floods, *Hazards, *Maps, *Colorado, Mapping, Surveys, Aerial photography.
Identifiers: *Colorado Springs(Colo).

Flood hazards near Sand Creek in the city of Colorado Springs, Colo., are shown by a map atlas of 57 sheets scaled about 1 inch = 200 ft. Data were collected by aerial photography. Flood areas were determined by matching water surface profiles with topography. Primary purpose is to provide maps of the flood hazard areas so that local governments can develop flood plain regulations. The data can also be used in the location and design of roads, bridges, and channel modification. Interpretations of the flood hazard analyses and recommendations to minimize flood damages are included. Except during the periods of storm runoff, the streambed of Sand Creek is dry. The flood-producing storms normally occur during the summer months from May through August. Runoff from melting snow does not contribute materially to flooding on Sand Creek. (Knapp-USGS)

WATER RESOURCES DATA FOR NEW YORK, 1972: PART 2. WATER QUALITY RECORDS.
Geological Survey, Albany, N.Y.
Data Report, 1973. 262 p, 9 fig, 2 tab, 20 ref.

Descriptors: *Water quality, *New York, *Hydrologic data, Data collections, Water chemistry, Microbiology, Water temperature, Sediments, Sediment load, Sampling.

Water resources data for the 1972 water year for New York include records of data for the chemical and physical characteristics of surface, ground, and precipitation water. Chemical, microbiological, water temperature, and fluvial-sediment water-quality information is presented. Chemical quality includes concentrations of individually dissolved constituents and certain properties or characteristics such as hardness of water, specific conductance, and pH. Microbiological information includes quantitative identification of certain bacteriological indicator organisms. Many surface-water samples for analyses are collected at or near gaging stations. The discharge records at these stations are used in conjunction with the computations of the chemical constituents and sediment loads. The description of the sampling station gives location, drainage area, periods of record for the various water-quality data, extremes of the pertinent data and general remarks. (Knapp-USGS)

Available from National Technical Information Service as PB-229 847 $6.75 in paper copy, $1.45 in

microfiche. Missouri Water Resources Center, Columbia, Completion Report, February 1974. 71 p, 24 fig, 5 tab, 12 ref, append. OWRR A-065-MO(1). 14-31-0001-3825.

Descriptors: Electrical studies, *Resistivity, *Gravity studies, Geophysics, *Channels, *Subsurface investigations, Carbonate rocks, Karst hydrology, *Missouri, Depth, Gravimetric analysis, *Groundwater movement.
Identifiers: Karst terranes.

The distinction of partially dissolved rocks from compact carbonate rocks and from the alluvial overburden is a major problem in geological engineering and water resources. Geoelectrical depth soundings after Schlumberger were applied over karst terranes in three locations of the Ozarks of Missouri. The zone of dissolved carbonate rocks shows intermediate resistivities between its low values of the overburden and its extremely high value for the compact rock. The investigation helped solve the problem of a disappearing river in Logan Creek Valley, near Ellington, Missouri. Combined geoelectrical and gravity surveys under consideration of some seismic near surface refractions indicate zones of increased depth and dissolution at the Ellington Fault. A detailed gravity profile across the fault shows a negative anomaly with a minimum of -2.0 mgal, which extends over approximately 3 miles with large lateral gradients. A theoretical model can explain the anomaly for a depth of the cavernous limestone of 350 feet with a bulk volume of fissures and stream channels amounting to 15%. The coincidence between the fault and the negative anomaly suggests that ruptures along several fault planes weakened the rock so that chemical dissolution from surface waters had a greater penetration.

Identifiers: *USSR, Marble, Thorium.

To obtain data on evolution of the isotopic composition of lead in carbonate rocks of ancient seas, analyses were made of about 60 samples of limestones, dolomite, and marble of varying geologic age and derived from different regions of the USSR (Aldan, Ukraine, Pamirs, Urals, etc.). Lead in seawater undergoes the same changes in its isotopic composition with time as lead in the earth's crust and, hence, reflects the evolution of terrestrial lead. (Josefson-USGS)

GROUNDWATER RESOURCES OF CENTRAL ASIA (RESURSY GRUNTOVYKH VOD TSENTRAL'NOY AZII),
Akademiya Nauk SSSR, Moscow. Institut Geografii.
N. T. Kuznetsov.
Akademiya Nauk SSSR Izvestiya, Seriya Geograficheskaya, No 5, p 45-54, September-October 1973. 3 tab, 12 ref.

Descriptors: *Groundwater resources, *Groundwater availability, *Groundwater, *Surface-groundwater relationships, *Mountains, Water balance, Alluvium, Estimating.
Identifiers: *USSR(Central Asia).

Distinct differences are observed in the distribution of natural groundwater resources in individual mountain systems of Central Asia. In the Mongolian Altay, Tien Shan, Kunlun Shan, and Altyn Tagh, groundwater resources decrease from west to east. The opposite trend is observed in the Nan Shan and Hangayn-Henteyn mountains. Minimum natural groundwater resources are found in mountains of western Nan Shan, the eastern part of Altyn Tagh and on southeastern ridges of Tien Shan. Total natural groundwater resources in the mountains of Central Asia are estimated at 45.62 cu km/yr, of which more than half (26.6 cu km/yr) are concentrated in the Tien Shan and Kunlun Shan. Flooding of the northern piedmont plain of Kunlun Shan is due to the presence of thick alluvial fans of the Guma, Yurung Kash, Kara Kash, Keriya, and Niya Rivers where groundwater is abundant, comprising a large part of the natural groundwater resources of the region. Natural groundwater resources of the Tarim basin, estimated at 11.64 cu km/yr, are concentrated in thick alluvial fans of the Muz Art, Konchedar'ya, Aksu, Yarkand, Yurung Kash, Kara Kash, and several other less water-bearing rivers. Natural groundwater resources of lowlands in the Tarim basin are estimated at 8.67 cu km/yr, of which 1.09 cu km/yr is groundwater outflow from the Kashgar amphitheatre. Estimated natural groundwater resources of Tien Shan and Kunlun Shan, lowland areas of Kashgaria and Dzungaria, and of major intermontane depressions of Central Asia are tabulated. (Josefson-USGS)

GROUNDWATER OF PASTURES OF KAZAKHSTAN (PODZEMNYYE VODY PASTBISHCHNYKH TERRITORIY KAZAKHSTANA).
Akademiya Nauk Kazakhskoi SSR, Alma-Ata. Institut Gidrogeologii i Gidrofiziki.
Izdatel'stvo 'Nauka' Kazakhskoy SSR, Alma-Ata, Akhmedsafin, U. M., editor, 1969. 304 p.

Descriptors: *Groundwater, *Confined water, *Groundwater resources, *Pastures, *Areal hydrogeology, Geomorphology, Stratigraphy, Rocks, Aquifers, Water table, Water levels, Water level fluctuations, Water wells, Water types, Thermal water, Connate water, Pore water, Water chemistry, Cross-sections, Mapping.
Identifiers: *USSR(Kazakhstan), Mineralization.

The area of pastures in Kazakhstan exceeds 180 million ha, which is 56% of all pastures in the USSR. Groundwater and artesian water of pastures in 15 Oblasts of the Republic and thermal water of pastures in 8 Oblasts of the Republic are described. Adaptation of different groundwater types to specific age and lithological complexes of rocks is examined, and studies are made of lithology and thickness of aquifers and of spatial distribution, depths of occurrence, mineralization, and chemical composition of groundwater and artesian water. Groundwater resources are determined for each large area of pasture, and prospects of their utilization are discussed. Recommendations are made for efficient use of groundwater and artesian water for agricultural water supply, flooding, and oasis irrigation. (Josefson-USGS)

A PROGRESS REPORT ON RESULTS OF TEST-DRILLING AND GROUND-WATER INVESTIGATIONS OF THE SNAKE PLAIN AQUIFER, SOUTHEASTERN IDAHO,
Geological Survey, Boise, Idaho.
E. G. Crosthwaite.
Available from Idaho Dept. of Water Admin., Statehouse-Annex 2, Boise, Idaho 83707 Price $0.50. Idaho Department of Water Administration Water Information Bulletin No 32, October 1973. 60 p, 11 fig, 1 tab, 11 ref.

Descriptors: *Hydrogeology, *Idaho, Aquifer characteristics, Stratigraphy, Basalts, Water table, Artesian aquifers, *Groundwater, Water wells, Data collections, Hydrologic data, *Aquifer testing.
Identifiers: *Snake Plain Aquifer(Idaho).

Test holes were drilled to depths of approximately 1,000 feet in the Mud Lake region of Idaho. A large part of the region is underlain by both sedimentary deposits and basalt flows. The saturated geologic section consists predominantly of beds of sediments that are intercolated with numerous basalt flows. Downgradient from the barrier, sedimentary deposits are not common and practically all the water-bearing formations are basalt. The sedimentary-basaltic sequence forms a complex hydrologic system in which water occurs under water-table conditions in the upper few tens of feet of saturated material and under artesian conditions in the deeper material in the southwest part of the region. Three wells were drilled and another well deepened in a part of the Snake River Plain where geologic and hydrologic data are sparse. Most of the material drilled was basalt with a few thin interbedded fine-grained sedimentary deposits. The sediments increase in thickness and coarseness near the mouth of the Big Lost River basin. The water-level data obtained from the wells indicate that the water-table gradient is relatively steep between Arco and American Falls and that the gradient is relatively low southwest of the area of steep gradient. The reason for the steep gradient is not clear, but the water table may be influenced by a rift zone which is visible more than three-fourths of the way across the Plain from the Craters of the Moon National Monument; by a change in thickness of the aquifer caused by a ridge representing a buried north-south treding mountain range; by a significant thickening of basalt filling an erosional basin immediately downgradient from the steepened gradient; or by a fault in the underlying basalt whose trace has been obliterated by younger flows. SINKHOLE PROBLEM ALONG PROPOSED ROUTE OF INTERSTATE HIGHWAY 459, NEAR GREENWOOD, ALABAMA,
Geological Survey, University, Ala.
J. G. Newton, C. W. Copeland, and L. W. Scarbrough.
Alabama Geological Survey, University Circular 83, 1973. 63 p, 21 fig, 2 plate, 3 tab, 18 ref.

Descriptors: *Land subsidence, *Karst hydrology, *Sinks, *Alabama, Withdrawal, Mine drainage, *Water table, Hydrogeology, Water level fluctuations, *Groundwater movement, Infiltration, Highways.
Identifiers: Greenwood(Ala).

Sinkholes in and adjacent to the proposed right-of-way of Interstate Highway 459 near the community of Greenwood in Bessemer, Alabama, pose costly construction and potential maintenance and safety problems. More than 150 sinkholes, depressions, and related features have formed in or near the right-of-way. Their occurrence began about 1950 and continued through March 1972. A general lowering of the water table during the early 1950's or the preceding decade, compounded with a prolonged drought during the 1950's, makes the area prone to the development of sinkholes. Openings along faults and a fold provide hydraulic connection between aquifers at the surface and mines at depths exceeding 1,000 feet. Cessation of pumpage from wells and mines has resulted in conditions favorable to the recovery of the water table. Sinkholes occur where cavities develop in residual or alluvial deposits overlying openings in limestone. The downward migration of the deposits into openings in the underlying limestone and the formation and collapse of the cavities are caused or accelerated by a decline in the water table that results in (a) an increase in the amplitude of water-table fluctuations, (b) the increased movement of surface water through unconsolidated deposits into openings in bedrock in areas where recharge had previously been rejected, (c) an increase in the velocity of movement of groundwater, and (d) loss of support to unconsolidated deposits overlying openings in bedrock. A recovery of the water table will probably result in a cessation of or drastic decrease in sinkhole development. (Knapp-USGS)

McMaster Univ., Hamilton (Ontario).
R. G. Wilson.
International Field Year for the Great Lakes Technical Manual Series No 1, 1971. 19 p, 4 fig, 4 plate, 1 tab, 88 ref.

Descriptors: *Soil moisture meters, *Instrumentation, *Measurement, Soil water movement, Soil water, Soil moisture, Nuclear moisture meters, Moisture content.

The techniques and the potential errors and accuracies of measuring soil moisture content, suction, and movement are reviewed. There are three widely used methods of measuring soil moisture content: the gravimetric, the neutron scattering, and the gamma-ray attenuation methods. The neutron scattering method is the most accurate for routine field measurements. The complex procedures required for the use of the gamma-ray attenuation method make it more suitable for laboratory work. The determination of the average moisture content in a volume of soil is best achieved by the neutron method, whereas the gamma-ray attenuation method is best suited for determining the moisture content at a given point in a soil profile. Soil suction can be measured with tensiometers, pressure and suction apparatus, psychrometers and electrical resistance units. Pressure and suction apparatus can be used only in a laboratory, and the accuracy of the technique is questionable. The use of tensiometer-pressure transducer systems has been limited to laboratories, but they have recently been developed for field use. They possess many advantages over the tensiometer-manometer systems including greater sensitivity and the possibility of recording. The main disadvantage of the tensiometer is that it is useful only over a limited range of suction values. Psychrometers and resistance blocks overcome this disadvantage but are not very accurate. Soil moisture movement is usually calculated from the hydraulic gradient and the hydraulic conductivity. Sensors to detect moisture movement have recently been developed but are strictly experimental at present. (Knapp-USGS)

Transactions of the ASAE (American Society of Agricultural Engineers), Vol 15, No 2, p 272-275, March-April, 1972. 6 fig, 10 ref.

Descriptors: *Soil moisture meters, *Tensiometers, *Soil water movement, Moisture tension, Pressure measuring instruments, Unsteady flow, Unsaturated flow, Soil water, Tension, Soil moisture, Irrigation, Measurement, *Non-destructive tests.

A new, fast-acting system has been developed to nondestructively measure moisture content of soil. The system is based on the old tensiometer technique with two important changes. A tensiometer barrier material made of polyvinyl chloride is used. This allows the water to pass to or from the soil much more quickly than previous materials. Diaphragm-type pressure transducers which have extremely small full-scale volumetric displacements provide much faster readings. These units were used to investigate moisture movement. Descriptions of technique and apparatus along with results are presented. (Skogerboe-Colorado State)

MEASUREMENT OF UNSATURATED HYDRAULIC CONDUCTIVITY BY THE CONSTANT OUTFLOW METHOD,
Florida Univ., Gainesville. Dept. of Agricultural Engineering.
A. R. Overman, and H. M. West.
Transactions of the ASAE (American Society of Agricultural Engineers), Vol 15, No 6, p 1110-1111, November-December, 1972. 6 fig, 4 ref.

Descriptors: *Drainage engineering, *Soil physical properties, *Soil water movement, Soil physics, Permability, Percolation, Soil moisture, Drainage, Drainage effects, Farm management, *Hydraulic conductivity, Measurement.

Unsaturated hydraulic conductivity was calculated for Lakeland fine sand using constant outflow from the bottom end of a column. Beginning at saturation, hydraulic head was measured at several positions during drawdown. Water content was found to drop from 34.6 percent at saturation to approximately 11 percent and a corresponding tension of 60 cm. Drainage appears to continue toward constant water content rather than toward the true equilibrium condition of constant hydraulic head. (Skogerboe-Colorado State)

Transactions of the ASAE (American Society of Agricultural Engineers), Vol 15, No 3, p 448-451, May-June, 1972. 8 fig, 13 ref.

Descriptors: *Subsurface drainage, *Tile drainage, Model studies, Mathematical models, Computer models, Drainage, Drainage engineering, Closed conduits, *South Carolina, *Water table, *Soil moisture, Climatic data.

A method of soil mosture balance proposed by Ligon et al. (1965) was modified to include surface runoff and checked against field data. The agreement of the measured and computed data indicated that the soil moisture balance was adequate for estimating soil moisture conditions and excess moisture. The transient-flow equation development by van Schilfgaarde (1965) was verified with five months field data from a field drainage laboratory. The excess moisture estimated from the soil moisture balance was considered as the net accretion to the water table. The soil moisture balance and the transient-flow equation were combined in a computer model of the environment, soil and drainage system. An average decrease of 1.67 percent of soil moisture in the upper 30 inches of soil was found for a one-foot drop of the water table. (Skogerboe-Colorado State)

SITE EVALUATION ACCORDING TO SOIL MOISTURE CONTENT AND ECESSARY IMPROVEMENT PRACTICES IN THE USSR,
Main Geophysical Observatory, Leningrad (USSR).
Ye. N. Romanova.
Soviet Hydrology: Selected Papers, No 3, p 250-259, 1972. 4 fig, 1 tab, 7 ref. Translation of Transactions of the Voyeykov Main Geophysical Observatory (Trudy GGO), No 288, p 66-82, 1972.

Descriptors: *Soil moisture, *Moisture content, *Sites, *Slopes, *Soil management, Irrigation practices, Hydrologic budget, Water balance, Precipitation(Atmospheric), Evaporation, Variability, Seasonal, Mapping, Equations.
Identifiers: *USSR, Nomograms.

To estimate variations in soil moisture content as a function of site, relief features must be used to quantitatively determine uneven distribution of precipitation and its uneven loss through evaporation from slopes of different steepness and orientation. To determine moisture supply of soils at different locations by humidity zones, nomograms were constructed for loam soils on slopes with a straight and concave profile and with a convex profile. These nomograms can be used to estimate similar moisture conditions in different zones and possible soil moisture variations as a function of site in each zone. Improvement practices for a complex relief in different humidity zones are diagrammed for spring and summer, and 11 regions in the USSR are delineated on a map to show locations with optimum soil moisture conditions and areas with most unfavorable soil moisture conditions within humidity zones ranging from excessively wet to arid. A MULTIPHASE MODEL FOR INFILTRATION (MODELE D' INFILTRATION POLYPHASIQUE),
Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
H. J. Morel-Seytoux.
Paper presented at French-English Symposium on Unsaturated Flow in Porous Media, Reading, England, January 24-25, 1973. 10 p, 5 fig, 4 ref, OWRR B-070 Colo(2).

Descriptors: *Infiltration, Model studies, Air environment, *Subsurface flow, *Unsaturated flow.
Identifiers: *Air flow, Air compressibility, *Imbibition, *Two-phase flow.

The traditional equations of water movement in the unsaturated zone neglect air movement. Under certain circumstances it is known that the viscous resistance to air flow and the air compressibility have significant effects on the water behavior. The goal is to show in a particular case, that the more rigorous approach of the two-phase flow theory does not complicate the solution of the problem. There is therefore no reason, theoretical or practical, not to treat the problem of water movement in the unsaturated zone in the more rigorous and, importantly, more physical manner.

THE ROLE OF SOIL WATER IN THE HYDROLOGIC BEHAVIOR OF UPLAND BASINS,
Georgia Univ., Athens. School of Forest Resources.
W. L. Nutter.
In: Field Soil Water Regime, Soil Science Society of America, Madison, Wisconsin, Special Publication No. 5, Chapter 10, p 181-193, 1973, 6 fig, 19 ref. OWRR A-022-GA(2) and A-025-GA(1), 14-31-0001-3210 and 14-31-0001-3510.

Descriptors: *Soil water movement, Infiltration, Retention, *Subsurface flow, Subsurface drainage, Recession curves, Streamflow, *Base flow, Effluent streams, *Storm runoff, Regolith. Identifiers: Dynamic storage, Basin geometry, *Upland basins, *Stormflow source areas.

The distribution of soil water in upland basins greatly affects the extent of source areas and the response patterns of both storm and between-storm streamflow. Except during the most extreme storms, all the precipitation falling on well-vegetated slopes infiltrates and while some reappears in the channel as stormflow, a major portion of the rain remains in the basin as dynamic storage. During a storm, the stormflow source area expands out from the stream channel as slopes contribute primarily unsaturated subsurface flow and the channel system lengthens. After the storm ceases, source areas may continue to expand as subsurface flow feeds the lower slopes near the channel, often leading to a second hydrograph peak several hours or days after the rain ceases. As the channel system and source areas recede, unsaturated subsurface flow continues to sustain baseflow. Basin parameters that affect the soil water regime and associated soil water energy conditions, and therefore the distribution of source areas, are slope length from channel to ridge, angle of slope, regolith depth, and regolith physical properties. Physical models of hillslope segments have provided some insight into the interrelations among the basin parameters as well as the flow pathways and source areas of subsurface flow.

LATERITIC DEEP WEATHERING OF GRANITE,
Western Australia Univ., Nedlands. Dept. of Soil Science and Plant Nutrition.
R. J. Gilkes, G. Scholz, and G. M. Dimmock.
Journal of Soil Science, Vol 24, No 4, p 523-536, December 1973. 5 fig, 2 tab, 24 ref.

Descriptors: *Weathering, *Granites, *Laterites, *Australia, Soil formation, Geochemistry, Soil chemistry, Mineralogy, Calcium, Sodium, Magnesium, Kaolinite, Trace elements, Iron, Aluminum.

Chemical and mineralogical analyses of two representative laterite profiles developed from granite in southwestern Australia show several depth zones defined by particular mineral suites and geochemistry. Changes in geochemistry in both profiles can be related to the stability of the major mineral species and to the common isomorphous substitutions occurring in them. Ca, Na, and Mg, which are mainly present in plagioclase feldspars and ferromagnesian minerals, are removed during the earliest stage of alteration of the parent granite. K, Mn, Zn, and residual Ca, Na, Mg, and Sr decrease as microcline and micas alter to kaolin. Al and Fe are most abundant in the surface zones which contain secondary sesquioxide minerals. (Knapp-USGS)

GAMMA RADIATION FOR MEASURING WATER CONTENTS IN SOIL COLUMNS WITH CHANGING BULK DENSITY,
Royal Veterinary and Agricultural Coll., Copenhagen (Denmark). Hydrotechnical Lab.
S. E. Olesen.
Journal of Soil Science, Vol 24, No 4, p 461-469, December 1973. 4 fig, 8 ref.

Descriptors: *Nuclear moisture meters, *Gamma rays, Calibrations, Equations, Bulk density, Sorption, Expansive soils, Clays, *Loam, Soil types.

Water profiles in soil columns were measured by the single-source gamma radiation method, using the normal attentuation equation, as well as linear and parabolic equations for the relation between bulk density and volumetric water content. To compensate for moderate changes in the bulk density during the experiment both initial and final bulk density and the water content were used in the water profile estimations. For a sandy loam soil, the radiation method without any corrections for bulk density changes resulted in a mean error of the volumetric water content estimation of 0.035 when the water content changed from 0.35 to 0.15. By correction for changing bulk density by means of a linear or a parabolic equation the maximum difference between real and estimated water content was 0.009 and 0.002, respectively. Applying the parabolic method, the error of a single water content measurement was 0.004. (Knapp-USGS)

SOIL MOISTURE UNDER FOREST, BUKIT TIMAH NATURE RESERVE, SINGAPORE,
Singapore Univ.
R. D. Hill.
Gard Bull (Singapore). Vol 26, No 1, p 85-93. 1972. Illus.
Identifiers: Forests, *Nature reserves, *Soil moisture, *Malaya(Singapore).

The results of a study of moisture of 3 forested hill-slope soils are presented and compared with the results of a similar study in Malaya. Soil moisture levels were usually higher than under other forms of vegetation. Statistical analysis indicated that change of moisture content was consistent within each soil but less consistent between soils. A series of statistical experiments suggested that except for the A soil horizon, soil moisture (as determined by drying) correlated reasonably well with number of rain days and that the introduction of the factor e (evapotranspiration) resulted only in slightly improved correlations except for the A soil horizon where the use of e gave much better correlations.--Copyright 1973, Biological Abstracts, Inc.

CHANGES OF SOIL HUMIDITY AND ITS CORRELATION TO PHYTOMASS PRODUCTION IN SANDY MEADOW ASSOCIATIONS,
Eotvos Lorand Univ., Budapest (Hungary). Dept. of Plant Taxonomy and Ecology.
E. Kovacs-Lang, and M. Szabo.
Ann Univ Sci Budap Rolando Eotvos Nominatae Sect Biol. 13, p 115-126. 1971. Illus.
Identifiers: Bromus-tectorum, Festuca-vaginata, Festuca-wagneri, *Phytomass production, Rye, Sandy meadows, *Soil humidity, *Danube River, *Tisza River.

In prairie associations characteristic of the sandy area between the rivers Danube and Tisza the phytomass production of overground and underground parts and its relation to precipitation and soil humidity were examined in 1 yr old (Brometum tectorum) and perennial meadows (Festucetum vaginatae danubiale and Festucetum wagneri) as well as in a rye field. In the vegetation periods of the years 1968 to 1969 soil humidity was regularly measured every mo. at 20, 40, 60, 100, 140 and 200 cm depth by means of a neutron scattering moisture meter. A predominance of un-

derground phytomass was characteristic of these natural associations. The production maximum of the 1 yr old meadow was observed in spring, followed by a gradual decay of organic substances in summer. The perennial meadows have a production maximum at the beginning of summer and another during the rainy autumn season. Soil humidity is influenced in the deeper layers by the quantity and in the upper layers by the distribution of rainfall. The prairies examined have an independent production rhythm, slightly influenced but not changed by humidity.--Copyright 1973, Biological Abstracts, Inc.

ECOLOGY OF FLOODPLAIN POOLS IN THE KASKASKIA RIVER BASIN OF ILLINOIS,
Illinois State Natural History Survey, Urbana.
R. Weldon Larimore, Edward C. Doyle, and A. R. Brigham.
Available from the National Technical Information Service as PB-229 849; $10.50 in paper copy, $1.45 in microfiche. Illinois University Water Resources Center, Urbana, Research Report No. 75, December, 1973. 136 p, 26 fig, 32 tab, 11 ref, 1 append. OWRR B-025-ILL(2). 14-31-0001-1897.

Descriptors: *Biological communities, Water chemistry, Periphyton, Plankton, Benthos, Fish management, *Illinois, Flood plains, Ecology, *Fish reproduction, Aquatic plants, *Nutrients, Invertebrates, Fish populations.
Identifiers: Plant nutrients, *Kaskackia River basin(Ill.), *Floodplain pools.

Physical and chemical conditions and biological communities in seven different types of floodplain pools in the upper basin of the Kaskaskia River were intensely studied over a period of 18 months and related to similar observations in the adjacent Kaskaskia River. The greatest influence on physico-chemical parameters, periphyton, benthos, and fish in the pools was the presence or absence of aquatic vegetation, particularly surface mats that restricted light penetration. The pools had less periphyton and more zooplankton than the river. Occasional flushing by the floodwaters reduced the accumulation of detritus and promoted biological production. Many species of fish moved into the floodplain pools to spawn and the young produced took advantage of the generally abundant zooplankton. The value of fish production from these pools depends to a considerable extent on the seasonal water regime. Floodplain pools are important to the Kaskaskia River system and should be preserved and managed to maintain their high production.

Dartmouth Coll., Hanover, N.H. Dept. of Eart Sciences.
R. C. Reynolds, and N. M. Johnson.
American Association for the Advancement c Science, 140th Paper presented at meeting, Sa Francisco, Feb. 1974. 22 p, 5 fig, 1 tab, 4 ref.

Descriptors: *Lakes, *Reservoirs, *Salinity *Water quality, Water properties, Artificial lake *Arizona, Utah, Stratification, Inflow, Lake sed ments, Limnology, Mixing, Thermal properties Turnovers, Upwelling, Saline water, Saline lake Chlorides, Calcium, Calcium carbonate, Bica bonates, Sulfates, Alkalinity.
Identifiers: *Lake Powell(Arizona).

Current and historical water quality data ar synthesized into an overall descriptive model c the chemical regime of Lake Powell. Sulfate, calc um, sodium, magnesium, chlorine, and alkalinit are analyzed, and concentration configurations ar determined. The salinity inputs from the Greer Colorado, and San Juan Rivers are analyzed a contributions of salts into the system of Lak Powell. The lake is a sulfate-bicarbonate-chlorid system with an approximate salinity of 550 ppr TDS. Monomictic convective and thermal regime are prevalent. Seasonal fluctuations in circulatio are documented. Calcium carbonate was found t precipitate from the input waters, with maximur precipitation probably occurring in the lowe reaches. This could account for a lowering o salinity of approximately 25 ppm. (Muller Arizona)

N Z Geogr. Vol 28, No 2, p 113-129. 1972. Illus.
Identifiers: *Avicennia-resinifera, *Mangrove *New Zealand(North Island), Pastures, Species.

The mangrove vegetation in New Zealand from the far north to its southern limits in the center of North Island is described. There are relatively few strata and the floristic composition is always simple. A list is given of the main species (representing 6 communities) associated with the New Zealand mangrove (Avicennia resinifera). The seral status of the mangrove vegetation is emphasized. They can be reclaimed and converted to good pasture. They are not otherwise of economic importance in New Zealand.--Copyright 1973, Biological Abstracts, Inc.

BIOLOGICAL STUDIES ON THE FRESHWATER SHRIMPS IN KOREA: 4. THE ECOLOGY OF MACROBRACHIUM NIPPONENSIS (DE HAAN) (IN KOREAN),
Texas A and M Univ., College Station. Dept. of Oceanography.
K. S. Chung.
Bull Kor Fish Soc. Vol 5, No 3, p 83-87. 1972, Illus. (English summary).
Identifiers: Biological studies, Ecology, Fishery, Food, *Korea, Macrobrachium-Nipponensis, *Protein(Fish), Sex ratio(Fish), *Shrimps, Spawning.

The fresh-water shrimp, M. nipponensis is one of the largest of the shrimp species and one of the most important types of protein food in fresh-water fisheries. It can be found from Cheju Island in the South to Chung-ju in river or swamp, in the North (Korea). Ecological features widely found in their natural environment were studied. Shrimps were collected from the Nak Dong River, near Pusan, Korea, once a month, from March-Dec. 1963. Larvae hatch from May-Sept., mainly in the month of July. The average sex ratio (male/female x 100) is 62.9% and goes down during the spawning season and rises from fall to spring season. The minimum size of the female with eggs is approximately 4.2 cm in body length, 3.5 g in body weight, and 1.5 cm in carapace length. Most shrimps of 5.75-7.75 cm in body length lay eggs. The dorsal spines of the rostrum are 10-16 (mode 13) in number and the ventral spines of the rostrum are 1-5 (mode 3) in number. (See also W73-13799)--Copyright 1973, Biological Abstracts, Inc.

EFFECT OF WATER-TABLE HEIGHT ON ROOT DEVELOPMENT OF PINUS CONTORTA ON DEEP PEAT IN SCOTLAND,
Macaulay Inst. for Soil Research, Aberdeen (Scotland).
R. Boggie.
Oikos, Vol 23, No 3, p 304-312, 1972, Illus.
Identifiers: Moisture, Morphology, *Peat, Pinus-contorta, *Root development, *Scotland, *Water table, *Pine trees.

Pinus contorta Dougl. was grown on deep peat in plots in which the water tables were maintained artificially at 5 levels 0-34 cm below the ground surface. Root growth was severely restricted under conditions of waterlogging, but a progressive improvement was seen as the level of the water table was lowered. Root morphology varied according to water treatment but in all profiles, root development was largely confined to the upper, aerobic horizons of the profiles as defined by absence of sulfide staining on Ag rods and redox potential measurements. There was a higher air/moisture volume ratio in the upper horizons of the peat in those parts of the plots planted with trees than in those under the natural vegetation.--Copyright 1973, Biological Abstracts, Inc.

A SURVEY OF STOMATAL MOVEMENTS AND ASSOCIATED POTASSIUM FLUXES IN THE PLANT KINGDOM,
Southern Piedmont Conservation Research Center, Watkinsville, Ga.
C. M. Willmer, and J. E. Pallas, Jr.
Can J Bot. Vol 51, No 1, p 37-42. 1973. Illus.
Identifiers: Arachis-Hypogaea, Commelina-Communis, Glycine-Max, Kalanchoe-Pinnata, *Potassium, *Stomatal movement, Surveys, *Epidemal tissue(Plants).

Histochemical tests for K+ were carried out on the epidermis of aerial organs from plants which varied in evolutionary development (e.g., club-mosses, ferns, angiosperms) and general morphology (e.g., monocotyledons, succulent dicotyledons, woody dicotyledons). These tests made on epidermal tissue with open or closed stomata suggested that K+ transport is implicated in stomatal movements regardless of the evolutionary level and the stomatal location in the plants investigated. In all species that displayed substantial stomatal opening, K+ was detectable in the guard cells. With small stomatal apertures, K+ was located in guard and subsidiary cells of Commelina communis L. leaves and Glycine max L. cotyledons. When stomata were closed, K+ was detectable in the subsidiary cells of the grass species, Kalanchoe pinnata Pers., C. communis, and, occasionally, in the epidermal cells surrounding the stomata of some ferns. A condition was also observed when virtually no K+ was detectable in the guard or subsidiary cells of C. communis leaves or G. max cotyledons. Commonly, when stomata were closed, K+ was not detectable in any cells of the epidermis. Exceptions were the 'K+ storage cells,' trichomes and epidermal cells of Arachis hypogaea L., and in the more primitive plants.--Copyright 1973, Biological Abstracts, Inc.

FOOD OF LARVAL SEA LAMPREY (PETROMYZON MARINUS) AND AMERICAN BROOK LAMPREY (LAMPETRA LAMOTTEI),
Guelph Univ. (Ontario). Dept. of Zoology.
J. W. Moore, and F. W. H. Beamish.
J Fish Res Board Can. Vol 30, No 1, p 7-15. 1973, Illus.
Identifiers: Achnanthes, *Algae, Amphora, Cyclotella, *Diatoms, Lampetra-Lamottei, Larval stages, Petromyzon-Marinus, *Sea lamprey, *Brook lamprey, *Anadromous fish, Fish diets.

Throughout the year, algae were the most frequently encountered organisms in the gut of larvae of landlocked and anadromous P. marinus and American L. lamottei. Relative abundance of organisms in the gut of both species was similar and did not change with length of larvae. In general, relative abundance of organisms in the gut was similar to that in samples of sediment and water. Occasionally, filamentous and episammic forms were not ingested because of their larger size. The number of algal cells ingested per unit of weight of sea lamprey decreased inversely with size of larvae. In the summer the number of algal cells in the gut was about thrice that found in the winter for larvae of comparable size. Survival among diatoms evacuated from the digestive tract varied from 45% in July (17.8 C) to 90% in Jan. (0 C). Representatives of the Achnanthes had the lowest survival rate (10-20%), while those of Amphora and Cyclotella had the highest (65-100%). Complete evacuation required approximately 54 and 70 hr at 16.0 and 2.5 C, respectively. Evacuation rate did not differ among the organisms consumed. The numbers of algae consumed by larval sea lamprey in a stream relative to their estimated abundance was considered negligible.--Copyright 1973, Biological Abstracts, Inc.

DIFFERENTIAL TOLERANCE OF SOME ARID-RANGE WHEATGRASSES TO SNOW MOLD,
Agricultural Research Service, Logan, Utah.
A. T. Bleak, and W. Keller.
Journal of Range Management, Vol 26, No 6, p 434-435, November 1973. 2 tab, 7 ref.

Descriptors: Resistance, *Fungi, *Wheatgrasses, *Molds, *Range grasses, Snow, Snow cores, Snowmelt, Mortality, *Utah.
Identifiers: *Snow mold, Replicated plot.

Tolerance of four wheatgrass species to snow mold caused primarily by the typhus fungi was determined. A replicated plot containing 30 accessions of wheatgrass was used. On the basis of the percent of 1 year old plants killed, fairway wheatgrass was the most susceptible, followed by crested wheatgrass, Siberian wheatgrass, and intermediate wheatgrass which exhibited no mortality and only moderate injury. This study was a result of an infestation of snow mold in the spring of 1971 on an experimental plot near Logan, Utah. (Mastic-Arizona)

HYDROMORPHOLOGY OF ALLUVIAL CHANNELS OF LOWLAND RIVERS AND TIDAL ESTUARIES,
Nanking Hydrotechnical Scientific Research Inst. (Chinese People's Republic).
K-J. Tou.

Available from NTIS, Springfield, Va 22151 AD-767 029 Price $3.00 printed copy; $1.45 microfiche. Naval Oceanographic Office Translation Report No 535, 1973. 23 p, 4 fig, 2 tab, 22 ref. (Translated from Scientia Sinica, Vol 14, No 8, p 1212-1227, 1965.)

Descriptors: *Alluvial channels, *Channel morphology, Discharge(Water), Particle size, Sediment transport, Bank stability, Stream erosion, Estuaries.
Identifiers: *China.

Theoretical studies of the morphology of the channels of streams and tidal estuaries are verified by measurements of water flow rates, channel width and depth, sediment size and transport (bedload and in suspension), and the mobility and stability of stream banks and bed in the principal streams of China and some in the USSR. Equations are derived relating these parameters to each other and to the cross-sectional and longitudinal profiles of channels. Channels of streams and tidal estuaries are compared. The effects of cyclical fluctuations in flood and tidal flows are discussed. An equation for the index of channel mobility describes the shape of both rivers and tidal estuaries. (Knapp-USGS)

Marine Geology, Vol 15, No 4, p 249-268, November 1973. 8 fig, 1 tab, 27 ref. ONR N00014-68-A-0215-003.

Descriptors: *Submarine canyons, *Valleys, *Atlantic Coastal Plain, Bathymetry, Sounding, Geomorphology, Pleistocene epoch, *Continental shelf, Marine geology, *New England.
Identifiers: Drowned valleys, New England continental shelf.

Seven post-Jurassic drowned or buried drainage systems were found on the southern New England shelf. The basement and younger stream patterns have a dominant southward trend. Fluvial action under stable tectonic conditions is suggested by low valley height/width ratios. Fluvial processes responding to sea-level withdrawals have greatly influenced the shelf's later development. Periodically during post-Paleocene time, sediment from subaerial erosion has been transported to the shelf edge by streams. Deltaic deposition on a subsiding base has controlled outbuilding on the outer shelf. The frequent presence of overlying drainage networks is the result of numerous sea-level regressions. Since Eocene time, sediment has been channelled to the deep sea via Block Canyon and its progenitor. Locally structures created by erosion and glacial deposition have governed drainage direction. On the inner shelf, late Tertiary - early Pleistocene streams were diverted southeastward and southwestward by Long Island's Coastal Plain escarpment and by secondary cuestas between eastern Long Island and Block Island. RIDGE AND SWALE TOPOGRAPHY OF THE MIDDLE ATLANTIC BIGHT, NORTH AMERICA: SECULAR RESPONSE TO THE HOLOCENE HYDRAULIC REGIME,
National Oceanic and Atmospheric Administration, Miami, Fla. Atlantic Oceanographic and Meteorological Labs.
D. J. P. Swift, D. B. Duane, and T. F. McKinney.
Marine Geology, Vol 15, No 4, p 227-247, November 1973. 15 fig, 34 ref. USACE Contract DACW79-69-C-0016; NSF Grants GA-1381 and GA-27305.

Descriptors: *Sedimentary structures, *Bottom sediments, *Continental shelf, Sand waves, Topography, Sand bars, Sands, Currents(Water), Storms, Ocean currents, Atlantic Coastal Plain, Barriers, Barrier islands, Marine geology, Erosion, Sedimentation.
Identifiers: Middle Atlantic Bight.

The ridge and swale topography of the Middle Atlantic Bight consists of longitudinal bed forms. This topography is the response to a regime of intermittent, south-trending storm currents. Ridges may be initiated on the shore face and detached as the coast retreats to form fields of isolated ridges, or they may be molded into the shelf-transverse sand massifs that mark the retreat paths of littoral-drift depositional centers at estuary mouths and off cuspate forelands. The ridge and swale topography is thus a stable end configuration toward which a variety of nearshore constructional topographies have converged during the Holocene transgression. Morphologic evidence for readjustment of ridge topography to the deepening shelf flow field during the Holocene transgression is discernible. (Knapp-USGS)

AN ADDITIONAL LOCATION OF METALLIFEROUS SEDIMENTS IN THE RED SEA,
Imperial Coll. of Science and Technology, London (England). Applied Geochemistry Research Group.
R. D. Bignell, J. S. Tooms, D. S. Cronan, and A. Horowitz.
Nature, Vol 248, No 5444, p 127-128, March 8, 1974. 1 fig, 1 tab, 9 ref.

Descriptors: *Brines, *Sea water, *Trace elements, Heavy metals, Hydrothermal studies, Hot springs, Bottom sediments, Manganese, Mercury, Oceanography.
Identifiers: *Red Sea.

Nereus Deep, in the Red Sea, has brines and metalliferous sediments of distinctive composition. Nereus Deep is situated within the NW-SE trending median valley of the Red Sea, is 40 km long by 12 km wide, and is divided along its length by a saddle into two parallel basins. Each basin contains a number of distinct depressions which either contain brine pools or show evidence of having contained them in the past. An appreciable thickness of iron and manganese-rich sediment contains various minor elements. Sulphide layers rich in zinc, copper, and lead may occur at greater depths. Large concentrations of mercury in the deep support this view and may indicate hydrothermal enrichments of less volatile elements below. (Knapp-USGS)

TRANSPORT OF SOIL PARTICLES BY SHALLOW FLOW,
Agricultural Research Service, Lafayette, Ind.
G. R. Foster, and L. D. Meyer.
Transactions of ASAE (American Society of Agricultural Engineers), Vol 15, No 1, p 99-102, January-February, 1972. 3 fig, 2 tab, 15 ref.

Descriptors: *Erosion, *Soil erosion, *Rill erosion, *Sheet erosion, Sedimentation, Erosion rates, Sediment yield, Sediment load, *Sediment transport, Soil conservation.

The Yalin equation was selected to describe th sediment transport capacity of overland flow fo use in mathematical soil erosion models. Hydrau lic variables in the equation are simply the hydrau lic radius and slope steepness. Soil parameter needed are particle diameter, specific gravity, an the critical tractive force from Shields' diagram When modified to consider mixtures of partic sizes, the equation predicted both the total tran port rate and also the particle size distribution o the transported material. When rilling developed transport rate predictions were within a factor of relative to actual transport rates from a bed o glass spheres. Also, the predicted particle size di tributions often agreed well with observed di tributions. When applied to a field erosion pl where the sediment load was at transport capacity the equation predicted sediment load within a fac tor of 2. (Skogerboe-Colorado State)

COMPUTER ANALYSIS OF OBLIQU ACOUSTIC REFLECTION FOR OCEAN SED MENT IDENTIFICATION,
New Hampshire Univ., Durham. Dept. of Electri cal Engineering.
A. K. Newman.
Available from NTIS as COM 73-11907, $2.7 paper copy, $1.45 microfiche. Sea Grant Publica tion Report No. UNH-SG-110, July 1973. 10 p, fig, 7 ref. NOAA DC 1-36114.

Descriptors: *Acoustics, *Remote sensing *Sediments, *Numerical analysis, Computer Sediment-water interfaces, Particle size.
Identifiers: Greens' function.

IBM 360-50 digital computer subroutines wer prepared in Fortran IV (G-level) to compute th value of the integral as various parameters wer varied, to obtain the information and insigh needed for the optimum system design for remot acoustic sensing of the ocean sediments. Th preliminary investigations of the many possibili ties made available by this approach are reviewed For example, at 5000 Hz, the ratio of the 0 de (normal incidence) acoustic reflections fror coarse sand over those from fine sand is 1.085:1 At a geometric equivalent angle of incidence of 6 deg this ratio is improved to 1.328:1. Further im provements are possible if the system is designed to allow multi-frequency and multi-angle operation using advanced signal processing. Unforeseen capabilities have surfaced from computer-experi ments designed to test the limits of such improve ments. Two different sediments having identica acoustic impedances (acoustic impedance = Den sity x Compressional Wave Velocity), with one sediment having 1.1 greater wave velocity and 1/1.1 less density, have identical acoustical return energy at 0 deg or normal incidence, and were computed to have acoustic returns in a nearly 2:1 ratio at a geometric equivalent angle of incidence of 60 deg at 5000 Hz. Further computer analysis is presented showing increased improvement in remote differential sediment identification via im proved system design. (Sinha - OEIS)

LITTORAL DRIFT COMPUTATIONS ALONG THE COAST OF FLORIDA BY MEANS OF SHIP WAVE OBSERVATIONS,
Florida Univ., Gainesville. Coll. of Engineering.
T. L. Walton, Jr.
Available from NTIS as COM 73-11896 PC$5.25 microfiche $1.45. Coastal and Oceanographic Engineering Laboratory Technical Report No. 15, Sea Grant Publication, February 1973. 97 p, 165 fig, 7 tab, 3 append. NOAA SG NG-3-72.

escriptors: Florida, *Littoral drift, Refraction(Water waves), *Friction, Topography, Coasts.
dentifiers: Shoaling, Ship wave observations.

. large data source of ship wave observations is sed for the computation of littoral drift along segents of Florida's coast. Wave transformation om the observation site to a section of shore inludes effects of shoaling, refraction, friction, and ercolation. Assumptions are made that limit the nalysis to an ideal beach with no anomalies in ffshore topography. The results are presented in series of littoral drift roses which make it possile to find annual rates of littoral drift for sections f Florida having sandy shorelines. A comparison f computed values of drift with existing estimated alues is made for specific locations. Results of he comparison confirm most of the estimated rift directions, however the drift magnitudes iffer significantly. (Sinha-OEIS)

ATES OF QUATERNARY GLACIAL EROSION AND CORRIE FORMATION, MARIE BYRD AND, ANTARCTICA,
Colorado Univ., Boulder. Inst. of Arctic and Alpine Research.
J. T. Andrews, and W. E. LeMasurier.
Geology, Vol 1, No 2, p 75-80, October 1973. 6 fig, tab, 25 ref. NSF Grants GA-4563 and GA-21488.

Descriptors: *Erosion rates, *Erosion, *Glaciers, Antarctic, *Cirques, Melt water, Geomorphology, Frost action, Freezing, Thawing, Ice, Volanoes.
dentifiers: *Marie Byrd Land(Antarctica).

Three volcanoes composed of palagonite breccia n Marie Byrd Land, Antarctica have been extenively modified by glacial erosion and have numerous large cirques. Two of the volcanoes are adiometrically dated, which enables estimates to e made of the rate of erosion. Rates of denudaion of 360 to 460 mm per 1,000 yr were obtained, ut differences in corrie size indicate that local eadward erosion is about 5,800 mm per 1,000 yr nd lateral erosion is about 800 mm per 1,000 yr. The rate apply to relatively incompetent rock. Subaerial flows of comparable age in the same region are not as intensively eroded. Erosion is probably caused by mechanical riving induced by the freezng of meltwater, which is in turn produced by ocal radiation conditions in the corries. Thus, glacial erosion seems to depend upon the existence of edrock exposed above the ice sheet and the production of meltwater. (Knapp-USGS)
W74-05717

COMPOSITIONAL SORTING OF TOPOGRAPHICALLY HIGH TENNESSEE RIVER GRAVELS: A GLACIAL HYPOTHESIS,
Mississippi State Univ., State College. Dept. of Geology and Geography.
J. M. Kaye.
*Glaciation, *Tennessee River, *Glacial sediments, *Mississippi, Pleistocene epoch, Gravels, Sediment sorting, Provenance, Sediment transport.

Compositional sorting of topographically high river terrace gravels along the southwestern portion of the Tennessee River valley may be explained by alternate blanketing and uncovering of the source of metaquartzite by glacial ice in the Blue Ridge province of the southern Appalachians. Glacial meltwater may have caused the Tennessee River to spill over into the Black Belt of Mississippi where metaquartzite cobbles are found associated with a Rancholabrean vertebrate fauna. Heavy minerals associated with the metaquartzite cobbles are similar on both sides of the present Tennessee Valley Divide, adding support for a glacially controlled temporary spillover of the Tennessee River. (Knapp-USGS)
W74-05718

PROPOSAL FOR A PARTICLE-SIZE GRADE SCALE BASED ON 10,
Wisconsin Univ., Kenosha. Dept. of Geology.
J. H. Shea.
Geology, Vol 1, No 1, p 3-8, September 1973. 2 fig, 1 tab, 50 ref.

Descriptors: *Particle size, *Classification, Sampling, *Sedimentology, Sedimentation.
Identifiers: Particle-size scales.

Because the United States will eventually adopt the metric system, geologists should consider abandoning the nondecimal Udden-Wentworth-Krumbein (UWK) grade scale of particle sizes. Most of the advantages claimed for the UWK system also apply to other geometric grade scales that have an associated log-transform scale. A new grade scale is proposed. An associated log-transform scale (the tau scale) is defined so that tau = 12 log 10 d/do, where do is grain diameter in millimeters and do is 1 mm. The proposed scale has easily remembered grade limits and easily calculated log-transform scale, repeating numbers, major classes of equal interval, and good potential for international adoption and application in other fields. (Knapp-USGS)
W74-05719

LATE QUATERNARY SEDIMENTATION IN THE ACTIVE EASTERN ALEUTIAN TRENCH,
Dalhousie Univ., Halifax (Nova Scotia). Dept. of Geology.
D. J. W. Piper, R. von Huene, and J. R. Duncan.
Geology, Vol 1, No 1, p 19-22, September 1973. 7 fig, 8 ref.

Descriptors: *Sedimentation rates, *Sedimentation, *Pleistocene epoch, *Alaska, *Glaciation, Turbidity currents, Bottom sediments, Stratigraphy.
Identifiers: Aleutian trench.

Sediments originally deposited on the Alaskan Abyssal Plain have been depressed to form the eastern Aleutian Trench. Simultaneously, a wedge of horizontally bedded sediments, about 1 km thick at its axis, has been deposited in the trench. The time-transgressive facies change between this wedge of sediment and the abyssal-plain sediment sequence shows up as a discontinuity on seismic records. Sediment is being deposited up to 10 times faster in the trench than on the abyssal plain. Ninety percent of the sediment in the trench arrived there by moving down the trench wall as slumps or in turbidity currents, and has been partly redistributed by turbidity currents flowing in a channel along the trench axis; 7% has come from the Survey or Channel distribution system on the abyssal plain; and 3% is pelagic (mainly ice rafted). Sediments pass from a sandy facies near the trench wall to a silt-mud facies on the abyssal plain. Sediment fill in the Aleutian Trench is abnormally thick as a result of Pleistocene glaciation; Neogene trench-fill sediments would be less than 800 m thick. (Knapp-USGS)
W74-05720

ABRASION IN PLACE: A MECHANISM FOR ROUNDING AND SIZE REDUCTION OF COARSE SEDIMENTS IN RIVERS,
Colorado State Univ., Fort Collins. Dept. of Earth Resources.
S. A. Schumm, and M. A. Stevens.
Geology, Vol 1, No 1, p 37-40, September 1973. 2 fig, 17 ref. NSF Grant GA-38621.

Descriptors: *Bed load, *Abrasion, *Gravels, *Saltation, Sediment transport, Sedimentology, Particle size, Weathering.

Rounding and reduction in size and weight of coarse particles occur over a significantly shorter distance in a stream as compared to the distance of travel required to produce a similar result in tumbling barrel or flume. This suggests that either the known processes of wear are more effective in streams than in the laboratory or that other processes are at work. Investigations of riprap failure by hydraulic engineers provide data on the forces acting on coarse particles and particle behavior prior to downstream movement. The experiments demonstrate that lift forces acting on a submerged cobble are large and vary significantly with time. When this effect of lift is combined with drag forces, a particle vibrates in place without downstream movement. With increased velocity, the particle lifts off the streambed and saltates downstream to a new position of temporary stability. During high-velocity flow, abrasion of cobbles in place and the chipping and fracturing during saltation can be significant factors causing rounding and size reduction of coarse sediments in rivers. (Knapp-USGS)
W74-05721

THE INCOMPLETE FLOOD PLAIN,
Florida State Univ., Tallahassee. Dept. of Geology.
W. F. Tanner.
Geology, Vol 2, No 2, p 105-106, February 1974. 1 fig, 1 ref.

Descriptors: *Flood plains, *Earthquakes, *Sedimentation, Lakes, Topography, Geomorphology, Sedimentation rates.
Identifiers: *Incomplete flood plains.

Incomplete flood plains are warped in such a manner (probably by tectonic deformation) that their upper surfaces are not the two-dimensional planes that alluvial rivers ordinarily build. Incomplete flood plains are not marked by oxbow lakes and other evidence of channel migration, but rather by lakes, ponds, marshes, and swamps of various sizes and shapes. The Magdalena River valley of Colombia has an incomplete flood plain through almost 1,000 km of its length. (Knapp-USGS)
W74-05722

ANATOMY OF A SHOREFACE-CONNECTED SAND RIDGE ON THE NEW JERSEY SHELF: IMPLICATIONS FOR THE GENESIS OF THE SHELF SURFICIAL SAND SHEET,
Dames and Moore, New York.
L. Stahl, J. Koczan, and D. Swift.
Geology, Vol 2, No 3, p 117-120, March 1974. 4 fig, 1 tab, 9 ref.

Descriptors: *Beaches, *Continental shelf, *New Jersey, *Barrier islands, Geomorphology, Sedimentation, Topography.
Identifiers: *Shoreface ridges.

Falling within the site survey area for an offshore nuclear power facility, Beach Haven Ridge, New Jersey, is the most thoroughly investigated shoreface-connected ridge on the Atlantic shelf. Its stratigraphy clearly indicates that it is of Holocene age and was initiated at the foot of the shoreface, after passage of the retreating barrier, as the leading edge of the shelf surficial sand sheet. SLOW MOVEMENT OF EARTH UNDER TROPICAL RAIN FOREST CONDITIONS,
Clark Univ., Worchester, Mass. Graduate School of Geography.
L. A. Lewis.
Geology, Vol 2, No 1, p 9-10, January 1974. 1 fig, 1 tab, 9 ref.

Descriptors: *Mass wasting, *Humid areas, *Tropical regions, Creep, Landslides, Slopes, Degradation(Slope), Erosion rates, *Puerto Rico, National forests.
Identifiers: El Yunque National Forest(P.R.).

In El Yunque National Forest, Puerto Rico, the average rates of soil movement are greater than rates in other forested areas and generally are greater than in other locales. Also, the velocity distribution indicates two zones of maximum movement. This phenomenon is not explained by normal creep behavior. For the wet tropics, theory must include the roles of throughflow and the distribution of plant roots, as well as the interaction between gravity and the individual expansion and constraction of soil particles. DEVELOPMENT OF FLUTE-MARK ASSEMBLAGES: 1. EVOLUTION OF PAIRS OF DEFECTS,
Reading Univ. (England). Sedimentology Research Lab.
J. R. L. Allen.
Sedimentary Geology, Vol 10, No 3, p 157-177, November 1973. 13 fig, 3 tab, 10 ref.

Descriptors: *Sedimentary structures, *Erosion, *Bed load, Ripple marks, Turbidity currents, Density currents, Sedimentation, Sedimentology, Vortices, Mud, Scour.
Identifiers: *Flute marks.

Experiments using a bed of hardened plaster of paris dissolved by a turbulent water stream are a practical analogue of natural mud-bed erosion. Paired defects evolve into compound flute marks which at a critical age become marks indistinguishable from structures developed from single defects. The critical age increases as the relative spacing of the paired defects grows larger but decreases as their alignment approaches the mean flow direction. Growth of the compound marks follows similar laws to single flutes. A natural assemblage of flute marks may be expected during an early stage of development to show a progressive reduction in the number-density of the structures, as a consequence of the merging of marks generated from defects sufficiently closely spaced to have interacted during the time available. (Knapp-USGS)
W74-05726

CHEMICAL WEATHERING OF SERPENTINITE IN THE EASTERN PIEDMONT OF MARYLAND,
Maryland Geological Survey, Baltimore.
E. T. Cleaves, D. W. Fisher, and O. P. Bricker.
Geological Society of America Bulletin, Vol 85, No 3, p 437-444, March 1974. 6 fig, 7 tab, 27 ref.

Descriptors: *Weathering, *Maryland, *Degradation(Slope), Geomorphology, Geochemistry, Water chemistry, Clays, Mineralogy, Erosion, Residual soils, Saprolites.
Identifiers: *Serpentinite, *Schist.

Weathering processes in a small watershed underlain by serpentinite in the Piedmont of Maryland were studied by means of a mass balance technique and were compared with the processes operative in a watershed underlain by schist. The two terranes are downwasting at a rate of 2.4 m per million years, but chemical weathering much more strongly affects the serpentinite (2.2 m per million year) than the schist (1.2 m per million years). The serpentinite lacks a saprolite cover because resistate minerals are absent and alumina in the bedrock is scarce. In contrast, the schist contains both quartz and a source of alumina in the alumino-silicate minerals and, as a result, has a thick saprolite mantle. The hydrologic consequences in the serpentinite terrane compared with the schist watershed are increased flood-flow discharge, greater fluctuation in seasonal, instantaneous base-flow discharge, and pronounced seasonal fluctuations in total discharge. The serpentinite stream water averaged 205 ppm of total dissolved solids in the base flow compared to 25 ppm in the schist. Stream water from the serpentinite is of the magnesium bicarbonate type; that from the schist is sodium-calcium bicarbonate type. On the serpentinite, substantial land-surface reduction (denudation) is effected by chemical weathering; mechanical weathering is secondary. On the schist terrane, mechanical weathering is the primary agent that lowers the land surface, even though chemical weathering has reduced the rock mass by almost one-half. (Knapp-USGS)
W74-05729

FACTORS DETERMINING BED FORMS OF ALLUVIAL STREAMS,
California Inst. of Tech., Pasadena. W. M. Keck Lab. of Hydraulics and Water Resources.
V. A. Vanoni.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 100, No HY3, Paper 10396, p 363-377, March 1974. 8 fig, 2 tab, 33 ref, append.

Descriptors: *Sedimentary structures, *Ripple marks, *Alluvial channels, Bed load, Dunes, Sediment transport, Hydraulic models, Equations, Sedimentation.

Laboratory and field data of bed forms of alluvial channels were analyzed according to similarity methods. The following variables are important in determining the bed forms of sand bed streams: flow depth, mean velocity, density, viscosity, median size of sediment, and the acceleration of gravity. The data thus analyzed are presented in six graphs of depth ratio against Froude number for each of six ranges of Reynolds number. This accounts for the effects of sediment size and water viscosity or temperature. Flume data indicate that the size distribution of the bed sediment also affects bed form. A relation is developed which predicts quite well the occurrence of ripple and dune beds. (Knapp-USGS)

EROSION CONTROL,
Soil Conservation Service, Stillwater, Okla.
W. L. Vaught.
In: Environmental Aspects of Geology and Engineering in Oklahoma; Proceedings of a Symposium of the Oklahoma Academy of Science, December 4, 1970, Stillwater: Annals of the Oklahoma Academy of Science, No 2, p 36-41, 1971.

Descriptors: *Erosion control, *Oklahoma, Soil erosion, Wind erosion, Urban runoff, Land use, Soil conservation.

Soil-erosion problems are of a complex nature. Large amounts of sediment, a product of soil erosion, now come from housing developments, road construction, and other nonagricultural areas. The upstream watershed program in Oklahoma is combating soil erosion on 9 million acres or 20% of the total area in Oklahoma. The 1,450 floodwater-retarding structures built under the programs have trapped 39 million tons of sediment. (Knapp-USGS)

A NEW SHEAR WAVE VELOCITY MEASUR MENT TECHNIQUE IN OCEAN BOTTOM SO SAMPLES,
New Hampshire Univ., Durham. Dept. Mechanical Engineering.
B. Celikkol, and P. M. Vogel.
Available from NTIS as COM 73-11913, $2. paper copy, $1.45 microfiche. Sea Grant Technic Report No. UNH-SG-112, July 1973. 12 p, 6 fig, tab, 19 ref. NOAA SG DC 1-36114.

Descriptors: *Soil investigations, Instrumentatio *Soil properties.
Identifiers: Shear wave velocity, Elastic prope ties, *Marine soils, Visco-elastic wave Velocimeters, *Ocean bottom soil.

An improved and convenient method is describe of obtaining the shear wave velocity of the soil t using inexpensive, portable and durable equi ment. The material seems to be adequate for so that are predominantly course sand or fin material which have a water content of 0.50 to pe haps 0.20. For soils that have a water content le than 0.20 it is difficult to press the probes into th soil. Therefore, if the shear wave velocity and a tenuation is needed for soil of low water conten the soil must be wetted to a higher water conten then the probes inserted, and then dried to th desired water content. For soils of water conte greater than 0.50, it is difficult to evaluate the pe formance of the velocimeter because it is n known whether or not a shear wave propagates soil of this type. If shear waves do propagate, th velocimeter must be judged inadequate for dete

minations of soils of high water content because then a water boundary forms at the surface of the probes. This makes an impenetrable boundary for transverse displacements. The precision of this system is adequate. By using the secondary pulse generator with a stable pulse length and an interval counter which measures time to 0.1 mu second one can obtain the transverse wave speed to three significant figures. RING-DISK ELECTRODE STUDY OF THE ANODIC BEHAVIOR OF GOLD IN 0.2M SULFURIC ACID,
State Univ. of New York, Buffalo. Dept. of Chemistry.
S. H. Cadle, and S. Bruckenstein.
Analytical Chemistry, Vol 46, No 1, p 16-20, January 1974. 5 fig, 2 tab, 13 ref.

Descriptors: *Gold, *Anodes, *Electrochemistry, Zeta potential, *Electrodes, Chemical reactions.
Identifiers: *Ring disk electrodes, Dissolution, Sulfuric acid, Ion selective electrodes, Platinum ring electrodes, Gold disk-gold ring electrodes, Gold disk-platinum ring electrodes.

The dissolution of gold from a rotating disk electrode was studied in 0.2 M H2SO4. Gold dissolution was observed at potentials greater than plus 1.13 V vs SCE. The rate of dissolution was determined as a function of potential by collecting the gold on a platinum ring electrode. Gold dissolution was also observed during the reduction of gold oxide films. The quantity of this cathodically dissolved gold was found to be a function of the electrode rotation speed, and the amount of gold oxide reduced. The increase in cathodically produced soluble gold with increasing rotation speed was shown to obey first order heterogeneous kinetics. The oxidation state of the cathodically produced gold was found to depend on the potential at which the gold oxide was formed. If the disk electrode was oxidized at E sub D less than plus 1.45 V, Au(III) was the predominant species collected at the ring electrode. However, if the oxidizing potential was greater than plus 1.45 V, a significant quantity of Au(I) was also collected at the ring electrode. (Holoman-Battelle)

Descriptors: *Electrochemistry, *Aqueous solutions, *Chlorides, Ions, Adsorption, Sodium chloride, Electrolytes, *Electrodes, *Volumetric analysis.
Identifiers: *Ion selective electrodes, Twin electrode system, Triangular sweep voltammetry, Voltammetry, Gold electrodes, Cyclic voltammetry, Perchloric acid.

The characteristics of a gold twin-electrode system in a thin-layer cell containing 0.1 M perchloric acid, and varying amounts of sodium chloride, were investigated by triangular sweep voltammetry. The 'adsorbed oxygen' layer starts to form above 1 V, and the peak from reduction of this layer shifts from 0.88 V to 0.65 V on changing the turn-around potential from 1.02 to 2.0 V. A distinct adsorption peak appears at 0.5 V, with cathodic peaks at 0.4 V and -0.1 V. Chloride adsorption is observed at 0.6 V, with desorption at 0.4 V. The dissolution of the gold electrode to gold(III) chloride occurs at 1.1 V; but this reaction is blocked above 1.2 V by the formation of the 'adsorbed oxygen' layer. The peak from the reduction of the gold(III) chloride is located at 0.7 V and is separable from the 'adsorbed oxygen' reduction peak. The electrode surface obtained from the reduction of gold(III) chloride shows characteristics different from those obtained by the reduction of the 'adsorbed oxygen' layer. (Little-Battelle)

SEPARATION AND ANALYSIS OF MIXTURES OF CATIONIC SURFACE-ACTIVE AGENTS BY SALTING-OUT CHROMATOGRAPHY,
Kao Soap Co., Wakayama (Japan). Industrial Research Lab.
S. Fudano, and K. Konishi.
Journal of Chromatography, Vol 87, No 1, p 117-124, December 5, 1973. 6 fig, 2 tab, 15 ref.

Descriptors: *Separation techniques, *Volumetric analysis, Salts, Anion exchange, Resins, *Surfactants, *Chromatography, Methodology.
Identifiers: *Salting-out chromatography, *Cationic surfactants, Alkyltrimethylammonium chloride, Dialkyldimethylammonium chloride, Alkylpyridinium chloride, Alkylpyridinium iodide, Alkyldimethylbenzylammonium chloride, Hyamine 1622, Amberlite, Methanol, Elution.

The separation and analysis of mixtures of cationic surface-active agents by salting-out chromatography is described and some aspects of the separation mechanism of salting-out chromatography are discussed. The following cationic surfactants were symthesized and purified by recrystallization from acetone: alkyltrimethylammonium chloride (C12, C14, C16, C18); dialkyldimethylammonium chloride (C12, C14); alkylpyridinium chloride (C12, C14, C16, C18); alkylpyridinium iodide (C12, C18); alkyldimethylbenzylammonium chloride (benzalkonium chloride, C12, C14, C16, C18); and Hyamine 1622. The chromatographic conditions finally adopted were as follows: resin, Amberlite CG-4B; column, Sephadex (25 mm I.D. and 410 mm long); eluent, aqueous 45 percent (or 55 percent) methanol-0.5 M sodium chloride solution; column temperature, 40.0C; flow-rate, 0.7 ml/min; determination, two-phase titration method with bromophenol blue as indicator. Not only could a homologous series of cationic surface-active agents be separated quantitatively, but the separation and determination of the constituents of their mixtures also became feasible. It is presumed that cationic surfactants molecules are present in an ionic state and probably pass through ted by exchange of their counter ions for anions in the eluent. The solubility of a surfactant in an eluent decreases as the chain-length of the alkyl groups in the surfactant increases. Surfactant molecules with long alkyl groups can be easily salted out and adsorbed on the resin, and they therefore have large elution volumes. For this reason, dialkyldimethylammonium salts that have large hydrophobic groups were not eluted under the conditions mentioned above. The adoption of the gradient elution method, however, may not only enable these surfactants to be eluted successfully but also extend further the applicable range. (Mortland-Battelle)

Descriptors: *Geochemistry, *Isotope studies, *Oxygen isotopes, *Deuterium, *Thermal water, Thermal springs, Precipitation(Atmospheric), Air temperature, Permafrost, Water chemistry.
Identifiers: *USSR, *Sayan Mountains, *Baykal Mountains.

The isotopic composition of oxygen and hydrogen in thermal water of the Sayan-Baykal mountain range was investigated to determine their origin and mode of occurrence. Low concentrations of oxygen-18 and deuterium in thermal water attest to the important role of solid and liquid precipitation as sources of water supply. Insignificant enrichment of thermal water in oxygen-18, as evidenced in the Tsipa Depression, is associated most likely with saturation of these waters by deep crustal components. The concentration, if any, of magmatogenic waters in thermal water is extremely small as compared with the total amount of meteoric water and does not exceed 2%. Average air temperature, total atmospheric precipitation, and average annual content of oxygen-18 in precipitation in the Lake Baykal basin in 1904-58 are tabulated. Tabulated results of determinations of the isotopic composition of oxygen-18 and deuterium in thermal and surface waters and in atmospheric precipitation show that the oxygen-18 content in water samples investigated varies between minus 13.2% and minus 19.6% and that of deuterium, between minus 92% and minus 160%. SOURCES AND MOVEMENTS OF WATER--AN INTERIM REPORT.
Geological Survey, Washington, D.C. Water Resources Div.
Available from New England River Basins Commission, 270 Orange Street, New Haven, Conn. 06511. New England River Basins Commission Long Island Sound Regional Study, November 1973. 50 p, 19 fig, 5 tab, 5 append.

Descriptors: *Estuaries, *Sounds, *New York, *Water circulation, Water balance, Climatology, Water resources, Water sources.
Identifiers: *Long Island Sound.

Knowledge about the sources, distribution and movement of water in the Long Island Sound Region is summarized. Climatological factors such as temperature, wind and cloud cover that affect elements of the hydrologic system are also discussed. The region has an abundant supply of freshwater derived from precipitation and from inflowing streams. Of the total precipitation falling on the land each year, about half returns to the atmosphere by evapotranspiration, while the remainder ultimately discharges to streams and the Sound, either directly by overland flow or indirectly by downward percolation to the water table. Long Island is underlain by a large groundwater reservoir of generally good quality. It meets almost all the island's freshwater needs. Long Island Sound is a 1,300 square mile water body with estuarine characteristics in its western and central parts and embayment characteristics in its eastern third. Circulation is controlled principally by tidal currents modified by freshwater inflow, weather conditions and topography. Surface tidal current patterns in the central and eastern Sound are elliptical and counter-clockwise in direction. At the eastern end, surface water flows into Block Island Sound, while more dense and saline bottom waters flow into Long Island Sound. At the western end, surface water from the East River flows into the Sound and bottom waters move into the East River. (Knapp-USGS)

J Fish Res Board Can. Vol 29, No 12, p 1749-1759. 1972. Illus.
Identifiers: *American plaice, Annual, *Canada(St. Margaret's Bay-U.S.), *Energy storage, *Gonad maturation(Fish), Growth, Hippoglossoides-platessoides, Summer, Winter, *Fish metabolism.

American plaice (H. platessoides) in St. Margaret's Bay, Nova Scotia had an annual energy storage cycle in which a mature 35 cm female stored 92 kcal during the summer period and used this energy for metabolism (72 kcal) and gonad maturation (20 kcal) in winter months. An additional 21 kcal was stored in the ovary during the summer period. These energy changes occurred in a fish with a total energy content of approximately 300 kcal and an annual energy increment of 51 kcal due to growth in length. The annual energy variation in immature females and males was less than in mature females. A comparison of summer production (143 kcal, excluding gonad energy) with net annual production (51 kcal) for a 35 cm female plaice indicated that higher yields would be obtained by harvesting at the end of the summer period than by taking the same fish at the end of the overwintering period.--Copyright 1973, Biological Abstracts, Inc.

A HYDROGRAPHIC INVESTIGATION OF WINYAH BAY, SOUTH CAROLINA AND THE ADJACENT COASTAL WATERS,
Georgia Inst. of Tech., Atlanta.
D. R. Bloomer.
Skidaway Institute of Oceanography Annual Progress Report (EPA Project No R-800372), Appendix D, p 171-235, January 1974. 32 fig, 17 ref.

Descriptors: *Currents(Water), *Estuaries, *Atlantic Coastal Plain, Water circulation, *Saline water intrusion, Tides, Winds, Path of pollutants, *South Carolina.
Identifiers: *Winyah Bay(SC).

Current measurements as well as temperature and salinity data were taken in the Winyah Bay estuary, South Carolina, and the adjacent coastal waters. The water motion in this area is controlled primarily by the dominant wind conditions and secondarily by the tide. Only during calm wind conditions (less than 10 knots) will the tidal effects alone be large enough to cause reversal of the shelf currents. There is evidence that an interaction between shelf and estuarine water motion may cause temporary interruptions in the otherwise smooth current variation following the change in the tide. The estuary may best be classified as partially mixed although these conditions may fluctuate greatly depending on position in the bay, stage in the tide, and rate of freshwater inflow. The Western Channel appears to be predominantly an ebb channel, particularly during periods of high runoff. The limit of saltwater intrusion proceeds beyond the confluence of the Peedee and Waccamaw Rivers during average runoff. Even during high runoff the wedge was never completely expelled from the estuary. (See also W74-05501) (Knapp-USGS)

THE OCCURRENCE AND DISTRIBUTION OF THE HYDROIDS OF THE GALVESTON BAY, TEXAS, AREA,
Texas A and M Univ., College Station. Dept. of Biology.
R. E. Defenbaugh, and S. H. Hopkins.
Available from NTIS Springfield, Va. 22151 as COM 73-11410, for $3.00 printed copy; $1.45 microfiche. Texas A and M University Sea Grant College Report TAMU-SG-73-210, June 1973. 202 p, 64 fig, 8 tab, 128 ref, 3 append. TAMU-SG-73-210.

Descriptors: *Aquatic animals, *Biological communities, Benthos, Aquatic life, Habitats, Systematics, Animal groupings, Phylogeny, Speciation, Varieties, *Texas.
Identifiers: *Hydroids, *Galveston Bay(Tex).

Examination of approximately 210 collections of hydroids from the Galveston Bay, Texas, area resulted in the identification of 29 species representing 19 genera in 10 families. Three of these species are provisionally described as new. Nine species are new records for Texas waters, one species is new for the Gulf of Mexico, and one species is new for the Atlantic coast, having been previously reported only from the North American Pacific coast. The species collected belong to one or more of three hydroid faunas: a sargassum fauna (restricted to or common on sargassum); an invertebrate epifauna; and a typical hydroid fauna (occurring on any suitable substrate. It is concluded that the hydroid fauna of the area has affinities with both the southern U.S. Atlantic coast and the Caribbean, but is closer to the Atlantic coast. (Knapp-USGS)

DISCHARGE PATTERNS IN TWO CREVASSES OF THE MISSISSIPPI RIVER DELTA,
Wisconsin State Univ., Oshkosh. Dept. of Geography.
D. J. Arndorfer.
Marine Geology, Vol 15, No 4, p 269-287, November 1973. 12 fig, 6 tab, 14 ref. ONR Contract N00014-69-A-0211-0003.

Descriptors: *Mississippi River, *Deltas, *Discharge(Water), *Sedimentation, Sediment transport, Tides, Alluvial channels, Bayous, Sedimentology, Levees, Floods.
Identifiers: Crevasses(Mississippi delta), Natural levees.

Variables which control water discharge in Rattlesnake Crevasse and, to a lesser extent, Little Lake Pond Crevasse, in the Mississippi River Delta are evaluated. Multiple-regression and analysis-of-variance procedures were used to assess the spatial and temporal interaction and changes in intensity of the variables. River stage, local drainage conditions, semi-monthly tide, diurnal tide, and wind determine discharge patterns in these two delta crevasses. The discharge of Rattlesnake and Little Lake Pond crevasses complements that of the primary distributaries of the Mississippi River Delta. During flooding tide, when seaward flow is inhibited in delta distributaries, the two crevasses attain maximum discharge. Flow in Rattlesnake Crevasse reverses direction during moderate and low river stages. (Knapp-USGS)

DEVELOPMENT OF A COMPUTER PROGRAM TO SIMULATE WIND WAVE GENERATION, REFRACTION, AND SHOALING IN THE GULF OF MAINE,
New Hampshire Univ., Durham. Engineering Design and Analysis Lab.
D. E. Thrall.
Available from NTIS as COM 73-11036, $3.00 paper copy. Sea Grant Publication UNH-SG-106, EDAL Report No. 113, March 1973. 48 p, 10 fig, 29 ref, 3 append. NOAA SG 2-35244.

Descriptors: *Computer programs, *Refraction(Water waves), *Winds, Maine.
Identifiers: *Wind wave generation, *Shoaling, Gulf of Maine, Wave paths.

The modification of an existing wave refraction program to include the effect of wind and its application to the Gulf of Maine is described. The selected refraction program plots the predicted wave paths, in addition to presenting them in numerical form. This feature makes the program valuable for teaching a coastal engineering class or for demonstrating coastal processes to the public domain in site selection hearings on offshore construction. Such graphic demonstration permits a much better conceptual understanding by the general public than is possible through numerical presentation of data. Judiciously used in conjunction with other decision-making tools, the graphic computer model should greatly improve mutual understanding between the technocrats and the public on coastal questions. A WAVE AND CURRENT INVESTIGATION IN THE NEARSHORE ZONE,
Purdue Univ., Lafayette, Ind. Dept. of Geosciences.
W. L. Wood, Jr.
Available from NTIS as AD-768 318, $4.75 paper copy, $1.45 microfiche. Final Report, June 1973. 149 p, 37 fig, 73 ref, 2 append. ONR N00014-68-A-0109-0002.

Descriptors: *Turbulence, *Waves(Water), *Wavelengths, *Surf, Currents(Water).
Identifiers: Nearshore, *Bottom friction, *Breakers, Prediction equation, Wave height, Surface waves.

A spatial resolution method was developed for determining wave lengths in the surf. It prevents the error introduced due to rapidly transforming waves which arises in conventional calculated wave length determinations. Subsurface photographic studies on particle velocities in breaking waves indicated both horizontally dominant and vertically dominant flow paths beneath the crests of breaking waves. Breaker height decay analysis shows that turbulence due to breaking dominates bottom friction. A prediction equation is generated which will predict the exponential decay of wave height as a function of distance shoreward from the break point. A complete wave shape classification system was developed for evaluating stability and energetics of the surf zone. It is used in conjunction with a two dimensional time projection of the free surface to evaluate nearshore surface wave behavior. (Sinha - OEIS)
W74-05699

MIXING OF SALINITY-STRATIFIED WATER BY PNEUMATIC BARRIERS. REPORT I: PRELIMINARY INVESTIGATIONS. HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss. Hydraulics Lab.
W. H. McAnally, Jr.
Available from NTIS as AD-762 132, paper copy $3.00, microfiche $1.45. Research Report H-73-4, June 1973. 23 p, 7 fig, 1 tab, 3 ref.

Descriptors: *Estuaries, *Mixing, *Salinity, Sedimentation, Bubbles, *Saline water barriers, *Stratification.
Identifiers: *Bubble screens, *Pneumatic screen.

Preliminary tests were conducted to identify the process involved in mixing salinity-stratified bodies of water by means of a pneumatic (bubble) screen. Salinity, velocity, and photographic data from these tests serve as a basis for planning experiments that will ultimately develop scaling relations for the use of pneumatic screens as mixing devices. In a two-dimensional flume with an initially two-layer, density-stratified system the flow pattern created by the operation of a pneumatic screen is a three-layer system. This flow was shown by flume tests using dye tracers on each side of the screen. A circulation cell is formed that draws water toward the pneumatic screen in the upper and lower layers, mixes the different-density waters in the immediate vicinity of the screen, and discharges the mixture as an intermediate-density wedge flowing away from the screen along the initial density interface. The results suggest that the pneumatic screen may be modeled by producing scaled currents in a hydraulic model by whatever means is convenient, thus avoiding problems of scaling the pneumatic screen apparatus. (Sinha-OEIS)

THE STRUCTURE OF MANAGEMENT AND PLANNING FOR THE COASTAL ZONE,
Michigan Univ., Ann Arbor. Dept. of Civil Engineering.
J. M. Armstrong.
Available from NTIS as COM 73-11551, PC$3.25, microfiche $1.45. Sea Grant Publication. Paper presented at Woods Hole National Workshop on Critical Problems of the Coastal Zone, Woods Hole, Massachusetts, June 2, 1972. 25 p.

Descriptors: *Coasts, *Natural resources, Management, Planning.
Identifiers: *Coastal zone.

Coastal zone management is the process of developing an understanding of the coastal zone as a system, using this knowledge to create a dynamic plan for its best use, and implementing and enforcing that plan. Since the coastal zone is a national resource, a national coastal zone management policy responsive to the needs and values of the citizenry should be established by the federal government. Consideration should be given to making provisions for such a policy to be administered by a single federal agency with coordination responsibility for other federal agencies with coastal zone responsibilities. The proposed policy should result in the enactment of appropriate and adequate legislation. (Sinha-OEIS)
W74-05702

MARINE STUDIES OF SAN PEDRO BAY, CALIFORNIA. PART I: CIRCULATION PATTERNS IN LOS ANGELES-LONG BEACH HARBOR DROGUE STUDY ATLAS AND DATA REPORT,
University of Southern California, Los Angeles.
D. F. Soule, and M. Oguri.
Available from NTIS as Com 73-11466 PC$4.25 microfiche $1.45. Sea Grant Publication No. USC-SG-6-72, December 1972. 113 p, 3 ref, numerous charts and tables.

Descriptors: California, *Circulation, *Harbors, *Water circulation, Data collections, Maps.
Identifiers: San Pedro Bay(Calif), Drogue study atlas.

A drogue study was carried out on June 13-14, 1972. The reduced data are presented from that study. A total of 57 drogues were deployed, of which 47 were recovered. Three sightings taken for each drogue on approximately half hour intervals were used to calculate by computer program and by manual triangulation the most probable positions. Elapsed time, wind and speed measurements are also entered in the computer print-out. Data are presented for each of the 47 drogues for which adequate sightings were obtained. Each data sheet is accompanied by a computer plot of the drogue track in the harbor. Summary plots of all drogues released in the morning, in the afternoon, at the surface, at 10-ft depths or at 20-ft depths are presented. Plots are included of the net movements of one morning drogue and one afternoon drogue from each station for each depth. Net movements indicate the over-all movement of water throughout the entire period given. The area of Fish Harbor and the region east of it show a high level of incursion and little circulation. This is of particular importance since the cannery and sewer outfalls are presently located to the east of the Fish Harbor area, and recreational installations are planned as extensions of the Fish Harbor east jetty. (Sinha-OEIS)

EFFECTIVENESS OF SEQUENTIAL PHOTOGRAPHY FOR COASTAL OCEANOGRAPHY,
Virginia Inst. of Marine Science, Gloucester Point.
M. Nichols, G. Thompson, M. Kelly, and L. Castiglione.
Available from NTIS as AD-760 713 PC$3.00 microfiche $1.45. Final Report Prepared for NOAA Spacecraft Oceanography Project and Office of Naval Research, November 1972. 167 p, 5 tab, 65 ref, 5 append. ONR N00012-71-C-371, N00014-72-C0268.

Descriptors: Chesapeake Bay, *Photography, Plankton, Phytoplankton, Environment, *Color, *Remote sensing, Suspended solids, Sediments, Oceanography, Plankton.
Identifiers: James River Estuary, *Densitometry, Water masses, Scientific satellites, *Time sensing, Temporal changes, *Tonal patterns.

Dynamic features of coastal waters can be detected and monitored in sequential photography by: (1) pattern interpretation, (2) simple comparative analyses, (3) matching of positive-negative pairs, and (4) comparative densitometry. Procedures for densitometric analyses of temporal changes are given. Application of the procedure is demonstrated by analyses of tones representing suspended sediment and plankton in the James estuary and lower Chesapeake Bay. Field and photographic studies revealed four types of water color boundaries that form either in local convergence zones of secondary currents or where water masses of different origin meet. Color changes were partly due to sediment concentration differences and were sometimes manifest by microplankton community changes, but the relationships are complex and variable. (Sinha-OEIS)

THE NET CIRCULATION IN THE WEST PASSAGE OF NARRAGANSETT BAY,
Rhode Island Univ., Kingston. Graduate School of Oceanography.
R. H. Weisberg, and W. Sturges, III.
Available from NTIS as AD-764 646 PC$4.25 microfiche $1.45. Technical Report Ref. No. 3-73, March 1973. 96 p, 46 fig, 18 tab, 25 ref, 4 append. ONR N00014-68-A-0215-0003.

Descriptors: Rhode Island, *Estuaries, Bays, *Water circulation, *Winds, Stratification, Sea breezes.
Identifiers: Narragansett Bay(RI), Water transport.

Narragansett Bay is a weakly stratified estuary comprised of three connecting passages of varying depths. The vertical distribution of horizontal velocity was observed in the West Passage using moored current meters. The primary objective was the analysis of the net circulation, i.e., the motion exclusive of the periodic tides. The net transport of water through the West Passage was observed to be seaward or landward over the entire water column for several days duration, with typical wind induced transport fluctuations of plus or minus 500 cu m/s. Hence, a net transfer of water flowing either way in response to the wind. Wind is concluded to be the dominant mechanism driving the net circulation in the West Passage of Narragansett Bay. This is in contrast with the classical views of gravitationally convected net estuarine circulation. (Sinha-OEIS)

MASS PROPERTY VARIABILITY OF SOME ESTUARINE SEDIMENTS,
Lafayette Coll., Easton, Pa. Dept. of Geology.
R. W. Faas.
Sedimentary Geology, Vol 10, No 3, p 205-213, November 1973. 3 fig, 3 tab, 13 ref.

Descriptors: *Bottom sediments, *Estuaries, Shear strength, Chesapeake Bay, Moisture content, Specific gravity, Physical properties, Density, Mass, Statistics, Statistical methods, *Virginia.
Identifiers: *York River estuary(Va).

Bottom sediments from two areas of the York River Estuary of southeastern Virginia were systematically sampled to depths of 40 cm and analyzed for water content, unit weight, and shearin

rength. The samples fell into: (1) a coarse-ained group of clayey sands, silty sands, and nd-silt-clays; and (2) a fine-grained group of silty ays and clayey silts. Analysis of variance etween both groups revealed distinct differences the mass properties. Means, variances, and efficients of variation for each parameter were termined and made possible a statistical charac-rization of each sediment type. The data esented may be used to predict expectable lues of mass properties for similar sediments, ving experienced similar depositional histories. napp-USGS)

LUSHING OF COASTAL EMBAYMENTS BY HANGES IN ATMOSPHERIC CONDITIONS,
edford Inst., Dartmouth (Nova Scotia). Atlantic ceanographic Lab.
. A. Heath.
imnology and Oceanography, Vol 18, No 6, p 9-862, November 1973. 8 fig, 7 tab, 10 ref.

escriptors: *Water circulation, *Bays, Estuaries, *Canada, Currents(Water), Winds, eteorology, Tides, Waves(Water), Surges, iches, Tidal effects.
entifiers: St. Margaret's Bay(N.S.), Halifax Har-r(N.S.), Strait of Canso(N.S.).

e circulation in several coastal embayments on e east coast of Nova Scotia, Canada, is induced changing atmospheric conditions. In summer d fall when the bays have essentially a two-yered vertical density distribution, quasi-riodic changes in wind and atmospheric pres-re associated with moving atmospheric sturbances produce a quasi-periodic flow which out of phase between the layers. Correlation tween the observed flow and atmospheric rameters together with results from a simple o-layered model indicate that the flow is obably produced by wind forcing. The observed eeds in the flow are of the same size as those in e mean circulation. The generation of the fluc-ating flow does not depend on the form of the ys and, therefore, this type of flow should be oduced in bays on other coasts where periodic anges in atmospheric pressure associated with nd variation are observed. THE VALUE OF THE TIDAL MARSH,
Georgia Univ., Athens. Inst. of Ecology.
J. G. Gosselink, E. P. Odum, and R. M. Pope.
Work Paper No. 3, May 1, 1973. 32 p, 6 tab.

Descriptors: *Tidal marshes, *Coastal marshes, *Aquatic environment, *Marsh management, *Land management, Wildlife management, Drainage, Watersheds, Estuary, Estuarine environment, Land development, Land reclamation, Surface waters, Swamps, Tides, Waste disposal, Sewage disposal, Pollution control, Sewage treatment, Fishlife, Fisheries, Shellfish, Nutrients, Nutrient requirement, Essential nutrients, Water quality.
Identifiers: *Coastal zone management.

Tidal marshlands depend in great part for their biological richness on fresh water nutrients. The value of the tidal marsh is dependent on the normal quality and quantity of nutrient feeding systems from inland or upland sources. For this reason land use planning and development for both agricultural and urban purposes must consider the stability and growth of the tidal marsh areas. Because of the tidal activity which faces these marshes daily it has been estimated that over 50% of the organic matter and nutrients which feed and support surrounding estuarine environments are produced in the tidal marsh. These nutrients support wildlife, plants and trees, fish and shellfish, all of which could not survive in the nursery stage without the life-substances derived from the tidal marshes. Land developers and population increases are exerting strong pressures to fill marshlands for commercial, industrial and residential use. Among the uses which most threaten the tidal marsh are careless planning; industrial, agricultural and urban sewage disposal; and chemical pollution. (Silber-Florida)

LAFAYETTE PUBLIC HEARING TESTIMONY.
Louisiana Advisory Commision on Coastal and Marine Resources, Baton Rouge.
September 7, 1972. 30 p.

Descriptors: *Louisiana, *Marshes, *Coasts, *Management, *Planning, State governments, Administrative agencies, Pollution, Pollution control, Environment, Environmental effects, Environmental sanitation, Wildlife habitats, Fishlife, Fisheries, Water quality, Water quality control, Land use, Land management, Land development, Drainage, Floods, Flood control, Flood prevention, Waste disposal, Sewage disposal, Channelization, Estuaries, Watersheds, Groundwater, Agriculture, Industry, *Coastal zone management.

Various agricultural, industrial, governmental and citizens' groups addressed the Coastal and Marine Resources Commission hearing on coastal zone and resource problems. Management and development of the region were keynote topics. Rivers, seaports, shipping, oil and mineral industries, wildlife, watersheds and estuaries, fisheries and canneries, recreation and scenery, drainage, flooding and conservation are all competing and must be contended with in planning the future development and management of the region. Pollution control and environmental preservation were the primary concerns of the citizens' groups, as were land development policies. Water resources development and the marine sciences were also of concern, particularly the vast food potential yet to be harvested from the sea. Consideration of the public health, welfare and livelihood was also brought to the Commission's attention. Soil and water conservation, erosion control, wildlife protection and pollution control and waste disposal were considered. (Silber-Florida)

LAKE CHARLES PUBLIC HEARING TESTIMONY.
Louisiana Advisory Commission on Coastal and Marine Resources, Baton Rouge.
October 5, 1972. 38 p.

Descriptors: *Louisiana, *Coasts, *Marshes, *Management, *Planning, State governments, Administrative agencies, Pollution, Pollution control, Environment, Environmental effects, Environmental sanitation, Wildlife, Wildlife habitats, Fishlife, Fisheries, Water quality, Water quality control, Land use, Land management, Land development, Drainage, Floods, Flood control, Flood protection, Waste disposal, Sewage disposal, Channelization, Estuaries, Watersheds, Oily water, Groundwater, Contaminants, Agriculture, Industry.
Identifiers: *Coastal zone management.

The problems and importance of the Lake Charles region are considered. In a hearing held October 5, 1972, the uniqueness of the state's 7 million acres of coastal lands and its renewable natural resources and abundant mineral resources were stressed. The commercial fishing industry of the state depends upon the perpetuation of this coastal zone and is of national importance, representing 23% of the country's production of fish. The conflict arises between those interests dependent upon undisturbed natural resources and those which require disturbance of the environment to obtain their resources. Testimony and suggestions concerning the development and coastal zone management plans of the region were received from various governmental, agricultural and industrial interests familiar with the region, including the rice and soybean industries, drainage districts, fisheries and canneries, the League of Women Voters, shipping and dock facilities, and the State Conservation Commission. Some subjects of intensive study include: salt water intrusion, wildlife habitat preservation, pollution control, water quality, land use control, drainage, flooding, solid waste management, shipping, spills, channelization, estuary and watershed preservation and ground water contamination. (Silber-Florida)

CAN WE SAVE OUR SALT MARSHES,
Connecticut Agricultural Experiment Station, New Haven.
S. W. Hitchcock.
National Geographic, Vol 141, p 729-765, June 1972. 2 illus.

Descriptors: *Coastal marshes, *Salt marshes, *Marsh management, *Wildlife conservation, *Fish reproduction, *Commercial fish, Tidal marshes, Shallow water, Erosion, Mudflats, Water level fluctuations, Estuaries, Ocean currents, Tidal waters, Chemicals, Sewage, Wetlands.
Identifiers: Coastal zone management.

Salt marshes are disappearing before the onslaught of factories, dump and fill, and homes with a seaward view. Chemicals and sewage pollute the wetlands and developers rout the sportsmen and commercial fishermen. Seventy-five species of fish, at least, spend part of their lives in the salt marshes. The grass that developers destory is the basis of marsh life. The marsh vegetation supplies food and nutrition to many species including fiddler and blue-claw crabs. Many species gow in the confines of the marsh and then go out into the oceans. The marsh forms when waves shape sands into offshore barriers. Tidal creeks cut through these bars, flooding the coves behind them twice daily with seawater. Cordgrass sprouts in the shallows which slows tidal currents causing them to deposit their silt. This forms a floor of nutritive mud. During low tide many nutrients are flushed out to marine life offshore. Salt hay is grown in marshes and is in demand as mulch for gardens and strawberry beds. Wetlands are prime areas for development and are worth up to $110,000 an acre. Already many marshes have been destroyed. Still others are being used as garbage dumps and factory sites. (Sperling-Florida)

JACK AND THE DRAGLINE,
W. Blassingame.
Audubon, Vol 75, No 3, p 53-59, May 1973. 1 map, 1 photo.

Descriptors: *Florida, *Salt marshes, *Coastal marshes, *Estuaries, Aquatic hibitats, Channel improvement, Dredging, Administrative agencies, Gulf coastal plain, State governments, Regulation, Permits, Federal government, Economic aspects, Political aspects, Legal aspects, Legislation.
Identifiers: *Coastal waters, *Fill permits, Administrative regulations.

The development of the Big Bend area of North Florida is discussed. The Big Bend is a stretch of about three-hundred miles of saltwater marshes and winding creeks. These marshes produce and shelter more sealife than all the rest of Florida including the Everglades. They are presently being threatened by dredging and filling operations which destroy the estuarine life. Many dredging operations were taking place without the proper permits although both a state and federal permit are required to dredge. The developers have great influence over county commissions, and high state officials. Additionally, even environmentally-minded officials cannot prevent what old laws allow. For example, a Florida statute defines the position of the mean high-tide line at 1.4 feet above sea level. Along the table-flat coast, an inch may mean a half-mile or more of salt marsh. A better solution might be like that of the Georgia statute which defines its estuarine areas as all tidally influenced waters, marshes, and marshlands lying within a tide elevation range of 5.6 feet above mean tide level and below. (Sperling-Florida)

HYDRODYNAMICAL STABILITY OF SALT WEDGE,
Washington Univ., Seattle. Dept. of Oceanography.
F. A. Lee.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 100, No HY1, Paper 10276, p 17-24, January 1974. 4 fig, 6 ref, append. NSF Grant GA-30745X.

Descriptors: *Saline water intrusion, *Estuaries, *Stratified flow, Streamflow, Open channel flow, Hydraulics, Hydrodynamics, Mixing, Saline water-freshwater interfaces, *Shear, Fluid mechanics.
Identifiers: *Salt wedges.

The hydrodynamical stability of a salt wedge is described in terms of a simple example consisting of two layers of fluids in uniform shear. The upper fluid is lighter than the lower fluid and is bounded by a free surface at the top. Salt wedge stability was studied through the growing and decaying modes of the system. Neutral stability curves are given in terms of the wave number and the thickness ratio of the upper layer to the shear layer. The stabilizing influences of the free surface and the interface are dependent on the wave number. Critical values of the dimensionless parameter are predicted to occur between 0.1 and 0.6 (depending on the thickness of the upper layer), below which stable flows can persist; its minimum value (0.1) agrees with experimental measurements. 3A. Saline Water Conversion

HIGHLY MINERALIZED GROUNDWATER AND ITS UTILIZATION (PODZEMNYYE VODY POVYSHENNOY MINERALIZATSII I IKH ISPOL'ZOVANIYE),
M. R. Nikitin.
Akademiya Nauk SSSR Vestnik, No 11, p 52-58, November 1973. 3 fig.

Descriptors: *Water utilization, *Desalinatio *Saline water, *Brackish water, *Groundwate Groundwater resources, Freshwater, Maps.
Identifiers: *USSR, *Mineralization.

The vast resources of freshwater in the Sovi Union are unevenly distributed. As a result, ma regions in southern European Russia, We Siberia, Kazakhstan, and Soviet Central Asia a experiencing a water deficit. This deficit can remedied or alleviated by (1) more rational use local freshwater resources; (2) introduction of e cess water supplies from other regions; and maximum utilization of local brackish and sali waters with a dissolved-salts content in the 1 to g/liter range. First generalizations of data brackish and saline groundwater in the USSR as possible water-supply source were made by i stitutes of hydrogeology and engineering geolo in Moscow (VSEGINGEO) and in Tashke (GIDROINGEO) in 1965-69. Prospects of usi highly mineralized groundwater depend mainly progress in saline water conversion. Although t cost of desalting is still relatively high, interest removal of salts from water has been stimulat by the degree of development and industrial app cation of distillation, freezing, electrodialysis, a reverse osmosis. Schematic maps show the di tribution of brackish and saline groundwater in t USSR and the division of the country in provinces based on the geographic and stra graphic occurrence of groundwater. METHOD FOR MAKING A HOLLOW FIBE SEPARATORY ELEMENT,
Dow Chemical Co., Walnut Creek, Calif.
H. I. Mahon, G. C. Doss, D. A. Gavin, and D. B. Vang.
Available from NTIS as PB-220 737, $3.00 pap copy; $1.45 microfiche. Department of the Inte or, Office of the Solicitor Patent Application Se al Number 206 793, December 1971. 16 p.

Descriptors: *Patents, *Desalination, Brine *Separation techniques.
Identifiers: *Hollow fiber elements.

A process for making hollow fiber tube bundl which are usefully employed as separatory el ments in various fluid separation devices f desalination of brines and like dialytic and osmot separation purposes is described. Similar tul bundles prepared from plastic hollow fibers m also be used for heat exchange and other purpose It is of special interest to prepare tube bundl composed of a large number of permeable, hollo fibers of very small diameter for desalination ar other medical purposes such as a blood oxygen tor, artificial kidney and the like. A moving belt hollow fibers is prepared by winding a continuo length of hollow fiber (or fibers) transverse around a pair of moving guide members. The mo ing fiber belt is convolutely wound upon an ax generally transverse to the direction of moveme of the belt to form a fiber bundle. A band of res is applied to at least one transverse section of t hollow fiber and subsequently solidified to form tube sheet. The separatory element is the prepared by cutting the tube sheet in a plar generally perpendicular to the bundle axis to for a tube sheet face portion having open fiber en terminating therein. METHOD OF MAKING SODIUM CHLORID CONCENTRATE FROM SEA WATER,
Dow Chemical Co., Midland, Mich.
J. S. Best.
U.S. Patent No. 3,779,030, 3 p, 1 fig, 9 ref; Offici Gazette of the United States Patent Office, V 917, No 3, p 865, December 18, 1973.

Descriptors: *Patents, *Arctic, Ice, *Sea wate Freshwater, *Sodium chloride, Potable wate Equipment, *Desalination processes.

The method comprises the following steps: (a) adding sodium chloride to sea water to form an admixture having a concentration of sodium chloride within the range of 15 to 25 weight per cent; (b) cooling the admixture to a temperature within the range of 0 deg F to -8 deg F, whereby ice crystals are formed; (c) separating the ice crystals from the residual sodium chloride concentrate; (d) adding fresh sea water to the residual concentrate to form a second admixture having a sodium chloride concentration within the range of 15 to 25 weight per cent; and (e) recycling the second admixture through steps (b) - (e). In the Arctic the sodium chloride can be used as an additive to crude oil in Arctic pipelines to prevent freezing; the water may be used as drinking water. (Sinha-OEIS)

METHOD AND APPARATUS FOR DISTILLING FRESHWATER FROM SEAWATER,
E. E. H. Koivisto, and R. V. J. Saari.
U.S. Patent No. 3,783,108, 5 p, 5 fig, 5 ref; Official Gazette of the United States Patent Office, Vol 918, No 1, p 413, January 1, 1974.

Descriptors: *Patents, *Desalination, *Evaporation, *Condensation, *Distillation, Seawater, Freshwater, Equipment, Desalination apparatus.

Seawater pumped from the warm surface layers of the sea, or from a basin warmed by the sun or warmed by the low-temperature waste heat of a power plant or industrial process, is evaporated and the vapor produced is condensed by colder seawater. Non-condensable gasses dissolved in the water to be evaporated are removed before the water enters the evaporators and after the gasses have passed through the condensers. The water to be evaporated flows through a plurality of consecutive evaporators located at a roughly barometric height above sea level, in which part of it is evaporated and the rest returned to the level from which it was pumped into the evaporators. The vapor produced in the evaporators is condensed in corresponding condensers, which are cooled by colder seawater. The non-condensable gasses can be pumped out by mixing them with the cooling water leaving the condensers. (Sinha-OEIS)

THE MODIFICATION OF GREAT LAKES WINTER STORMS,
National Oceanic and Atmospheric Administration, Boulder, Colo. Environmental Research Labs.
I. K. Weickmann.
Technical Report ERL 265-APCL 26, January 1973. 103 p, 84 fig, 7 tab, 49 ref.

Descriptors: *Snowfall, *Weather modification, Great Lakes, Great Lakes Region, Cloud seeding, Mathematical models, Snow.

The mesoscale structure of Great Lakes winter storms shows that the heaviest precipitation falls near the shorelines and decreases in intensity further downwind. This is partly caused by the diminishing intensity of the convective cloud systems as they move inland and away from the warm convective moisture source, and partly because the more intensive convective clouds produce heavy precipitation particles, like graupel and rimed snowflakes, that fall close to the shore while the lighter particles are carried farther inland. Consequently, if lighter precipitation particles could be formed through overseeding the clouds, the snow would be carried away from the shorelines and advected over a larger inland area. This was tested by seeding from the ground and air, tracking the seeding agent through the cloud system with an airborne freezing nucleus counter, and analyzing AgI nuclei in the precipitated snow crystals. Snowfall can probably be affected in the desired manner. However, there is a strong dependence on the cloud top temperature, which indicates that snowfall can be initiated, redistributed, or not be affected at all. No objective analysis of the seeding effect can be devised due to the great difficulties in accurately measuring the rate of snowfall. Unless the seeding efficiency of the generator used produces enough nuclei at the location in the cloud system where nuclei are needed, the effect is most likely irrelevant or lost in the background. Through application of comparative snow-crystal analysis, the plausibility that the Great Lakes winter storms belong to a more general category of shallow winter storms for which boundary layer flow constitutes an important origin was examined. This storm type occurs frequently not only in large-scale orogenic precipitation but also in large-scale cyclonic warm-front type snowstorms. (Knapp-USGS)

BOOM IN THE U.S. DESERT--CAN IT KEEP ROLLING.
U.S. News and World Report, Vol 75, p 51-56, September 17, 1973. 1 tab, 12 photo.

Descriptors: *Arizona, *Arid lands, *Reservoir operation, *Water conveyance, *Water distribution(Applied), Water shortage, Desalination plants, Forecasting, Pipelines, Aquifers, Irrigation systems, Aqueducts, Damsites, Hydroelectric plants, National monuments, Semiarid climates, Water supply development, Water resources development, Pumping, Water storage, Dams, Water utilization.
Identifiers: *Energy crisis.

The boom in the Southwest United States is discussed, and whether water and energy supplies will be available to enable the growth to continue. To date, attempted solutions to water supply problems have been long pipelines, reservoirs, and aqueducts. Problems are arising due to the energy crisis, since electricity is essential for pumping and there are no more major dam sites available for hydroelectric power. Phoenix obtains its water from a 70 year old irrigation project. Homes, offices, factories, and shopping centers have simply moved into the irrigated fields, taking over the water rights. These activities will probably cause food prices to rise. Presently under construction and due for completion in 1980 is an aqueduct from the Colorado River. One recent conflict between growth and the environment arose over Glen Canyon Dam. It provides peaking power to Southwest cities but the filling of Lake Powell behind the dam for storage of water would flood Rainbow Bridge National Monument. Problems such as this are everpresent, but they are recognized, and plans are being formulated to overcome them. (Sperling-Florida)

AUGMENTING WATER SUPPLIES OF THE VOLGA RIVER AND DIVERTING PART OF THE RUNOFF OF NORTHERN RIVERS SOUTHWARD (O POVYSHENII VODOOBESPECHENNOSTI R. VOLGI I PEREBROSKE CHASTI STOKA SEVERNYKH REK NA YUG),
I. A. Gerardi.
Gidrotekhnika i Melioratsiya, No 11, p 112-117, November 1973. 1 fig, 1 tab.

Descriptors: *Streamflow, *Flow augmentation, *Diversion, *Alteration of flow, *Water management(Applied), Water utilization, Water resources, Water resources development, Planning.
Identifiers: *USSR(Volga River).

In all important economic regions of the RSFSR, the Ukraine, republic of Soviet Central Asia, the Transcaucasus, Kazakhstan, and even Belorussia, the scale and tempo of development of productive resources in the next 20-30 years will depend, to a great extent, on measures to increase natural water resources. Annual renewable streamflow in these regions (including the Volga, Dnieper, Kuban' and Terek Rivers) is about 480 cu km or 10.5% of total streamflow in the USSR. In relatively dry (75% probability) and dry (95% probability) years, total streamflow in the European south of the USSR decreases to 417 cu km and 346 cu km, respectively. Normal supply of water to all branches of the national economy in river basins of southern European Russia can be achieved only through diversion of flow from other river basins. In European Russia there is an acute need for a single water management system of regulation and interbasin redistribution of flow, based on water resources of the Volga and on diversion of part of the flow of northern rivers into it. The main contributors to this system should be the northern rivers and lakes of northwest European Russia. Two plans are envisaged for diverting northern waters to the south: (1) the western plan which provides for transfer of part of the flow of northern rivers into upper reaches of the Volga River and into the Rybinsk Reservoir; and (2) the eastern plan, whereby water is redirected into upper reaches of the Kama River. TECHNOLOGICAL MODIFICATION OF THE SEEDLING METHOD AND ANALYSIS OF ITS USEFULNESS FOR EVALUATION OF SALT TOLERANCE IN PLANTS,
Y. M. Ivanov, and G. V. Udovenko.

Available from the National Technical Information Service as TT-72-51131 $3.25 in paper copy, $1.45 in microfiche. Translation, TT-72-51131, 1973, 22 p, 2 tab, 31 ref. Trans. from Russian.

Descriptors: *Salt tolerance, *Resistance, *Seeds, *Germination, *Salinity, Saline soils, Salts, Metabolism, Reproduction, Plant growth, Viability, Plant physiology, Stress, Plant growth, Crop response, Growth rates, Plant growth regulators, Soil-water-plant relationships. Saline water, *Reviews.

A literature review is presented of the seedling method of salt tolerance in plants. This method involves the germination of seeds in a saline solution since the study of germination under field salinity conditions is impossible. The salt tolerance of the variety may thus be determined in light of specific environmental constraints placed upon the seedling. Several variations of the method include growth media, salinities, temperature, light, and nutrient considerations. Emphasis is placed on recent developments and modifications in the seedling method which has appeared in Russian literature. (Muller-Arizona)

WATER FOR INDUSTRIAL DEVELOPMENT IN CALHOUN, CHICKASAW, CHOCTAW GRENADA, MONTGOMERY, WEBSTER, AND YALOBUSHA COUNTIES, MISSISSIPPI,
Geological Survey, Jackson, Miss.
R. Newcome, Jr., J. M. Bettandorff, and D. E. Shattles.
Mississippi Research and Development Center Publication, 1973. 64 p, 31 fig, 13 tab, 24 ref.

Descriptors: *Water supply, *Industrial water *Mississippi, Surface waters, Groundwater Hydrologic data, Data collections, Water yield Streamflow, Transmissivity, *Water wells.

An investigation of the water resources of the area comprising Calhoun, Chickasaw, Choctaw Grenada, Montgomery, Webster, and Yalobusha Counties, in north-central Mississippi, was begun in April 1970 to gather and disseminate facts on the quality and quantity of the water available for industrial use. The area represents six of the State's physiographic provinces, four of its large river basins, and most of its freshwater-bearing geologic units. The area also contains two major flood-control reservoirs, Grenada and Enid Lakes. Present water use is 17 mgd, practically all obtained from wells. A much larger usage could be supported by the streams, lakes and aquifers. The largest streams are the Yalobusha, Big Black, and Skuna Rivers, and the long-term average runoff from the area is 0.8 mgd per sq mi. Sustained dry-weather flow ranges from 0 to 0.04 mgd per sq mi. The chemical quality of the surface water in the study area is suitable without treatment for most industrial purposes. The fresh-groundwater section is 500 to 2,500 feet thick and contains aquifers ranging in age from Cretaceous to Pleistocene. The principal aquifers are confined and many are capable of yielding moderate to large supplies to wells. Permeabilities of 100 to 500 gpd per sq ft are common; transmissibilities of 2,000 to 55,000 gpd per ft were determined from pumping tests. The most productive wells are in the Meridian-upper Wilcox aquifer and several are pumped at nearly 1,000 gpm. Groundwater in the Cretaceous aquifers is highly mineralized and commonly has high concentrations of fluoride. The Tertiary aquifers have softer, less mineralized water. High concentrations of iron are present in water from all the aquifers. Most of the groundwater is alkaline. Temperatures of water from shallow aquifers are about 20 deg C from the deepest aquifers about 4 deg C. (Knapp-USGS)

DEVELOPMENT OF PREDICTION RELATIONSHIPS FOR WATER REQUIREMENTS WITH IRRIGATION COOLING,
Kentucky Water Resources Inst., Lexington.
B. J. Barfield, J. N. Walker, and F. A. Payne.
Available from the National Technical Information Service as PB-229 791; $3.25 in paper copy, $1.45 in microfiche. Research Report No. 70, 1974. 49 p, 13 fig, 2 tab, 1 graph, 29 ref, 2 append. OWRR A-028-KY(1). 14-31-0001-3217 and 14-31-0001-3517.

Descriptors: Irrigation, *Evapotranspiration, *Energy budget, Leaves, Temperature, Model studies, Mist irrigation, *Forecasting, Cooling, Sorghum, *Water requirements.
Identifiers: Plant temperatures, Energy balance, *Leaf temperatures, Arizona sorghum.

A model for predicting leaf temperatures during an off-on mist cycle is presented. The model uses a combination of energy budget and aerodynamic techniques. The model was tested for dry leaf temperature and evapotranspiration predictions using average hourly data from Arizona. The accuracy was good. It was also tested for dry leaf temperature predictions using two to three minute data with a widely varying net radiation. When reasonable values of stomatal resistance were used, the agreement was again good. The model was tested for prediction of wet leaf temperature with a ten minute on, fifty minute off mist irrigation cycle. The agreement was fair when using reasonable input parameters. The poorest predictions were during the mist on cycle. (Grieves-Kentucky)

WATER-USE EFFICIENCY AND ITS RELATION TO CROP CANOPY AREA, STOMATAL REGULATION AND ROOT DISTRIBUTION,
Kansas Agricultural Experiment Station, Manhattan, Evapotranspiration Lab.
I. D. Teare, E. T. Kanemasu, W. L. Powers, and H. S. Jacobs.
Agron J. Vol 65, No 2, p 207-211. 1973. Illus.
Identifiers: *Crop canopy, Distribution, *Evapotranspiration, Glycine-Max, *Root system, *Sorghum, *Stomatal, Transipiration, *Soybeans, Water utilization.

The differences in water-use efficiency between sorghum (Sorghum bicolor (L.) Moench) and soybean (Glycine max (L.) Merrill) were compared in terms of leaf area index (LAI), size of root system, canopy stomatal resistance (Rc), net assimilation rate (NAR), and evapotranspiration (ET). The field water budget was measured by recording the rainfall and irrigation water applied in relation to the ET as measured with 2 weighing lysimeters. The evapotranspiration rates of the 2 crops began to diverage about Aug. 15. This was the period when the soybean canopy began to close and the soybean LAI increased to about 1.5 times that of sorghum. NAR for sorghum during stalk elongation and heading (Aug. 15) was nearly 4 times that of soybeans during that time. Divergence of the 2 evapotranspiration curves coincided with observed differences in canopy stomatal resistance. In Aug. after a stress period, the Rc for sorghum at 1 and 3 pm was nearly 3 times the Rc for soybeans. The increase in Rc for sorghum was concomitant with an air temperature increase of 3C above the air temperature near soybeans. Sorghum had approximately twice the weight of roots per volume of soil as soybeans. Even though atmospheric demand for water was similar for the 2 crops, sorghum was able to close its stomata more than soybeans, and thus conserve soil water even with a larger root system and more water in the soil profile rsulting from reduced evapotranspiration. Water-use efficiency of sorghum (g DM/kg H2O) was approximately 3 times that of soybeans on dry matter or grain yield bases.--Copyright 1973, Biological Abstracts, Inc.

Identifiers: Water deprivation, Agricultural products.

The relationship between soil moisture stress, evapotranspiration, and marketable yield of crops - where the yield is a reproductive organ or associated product - is examined. Under conditions of constant stress, yield is reduced as a linear function of stress. Where stress is applied at different stages in the development of the crop, no simple reltionship exists. To predict yield from the water available or from evapotranspiration, the severity of stress and the physiological stage of development must be defined. A disproportionate reduction in yield is induced by water stress during the phases of reproduction corresponding to the period of peak evapotranspiration. Therefore, if irrigation engineers cannot plan their systems for times of peak demand, cost-benefit analyses should reflect probable yield reductions. (Skogerboe-Colorado State)

W. E. Hart.
Transaction of the ASAE (American Society of Agricultural Engineers), Vol 15, No 4, p 656-661, July-August, 1972. 14 fig, 1 tab, 13 ref.

Descriptors: *Irrigation practices, *Irrigation design, *Sprinkler irrigation, *Irrigation systems, Uniformity coefficient, Computer models, Application methods, Application equipment, Sprinkling, Crop production.

Sprinkler irrigation systems are evaluated by determining the uniformity of water as it is applied to the surface of the ground. The plant responds to the distribution of the water as it occurs within the soil. The gradients existing within the unevenly wetted soil move moisture laterally (and vertically) within the profile, causing the water within the soil to be more uniformly distributed than indicated by the initial, surface-measured distribution. The extent of this movement throughout the soil, within a reasonable length of time, appears to be a function of the following variables: initial moisture content, average application rate, distribution of water as applied to the surface, length modulus, soil type, and total applied water. Current methods of designing irrigation systems, which are based almost exclusively on anticipated initial uniformity, are inadequate if the aim of the design is to provide the most economical system possible. VOLUME BALANCE METHOD FOR COMPUTING INFILTRATION RATES IN SURFACE IRRIGATION,
Orissa Univ. of Agriculture and Technology, Bhubaneswar (India).
R. Lal, and A. C. Pandya.
Transactions of the ASAE (American Society of Agriculture Engineers), Vol 15, No 1, p 69-72, January-February, 1972. 4 fig, 2 tab, 7 ref.

Descriptors: *Irrigation practices, *Irrigation efficiency, Infiltration, *Surface irrigation, Irrigation design, *Infiltration rates, Unsaturated flow, Irrigation, Irrigation engineering.

Based upon the equation of continuity an empirical infiltration equation can be developed from the water measurements during surface irrigation. This so called volume balance method of calculating infiltration rate from surface irrigation data is most practical as it presents the actual mean conditions that exist during irrigation application. For high degree of accuracy, small time increment may be taken and calculations involved can be conveniently done by using computer techniques. An example of computation based upon field data collected at the Indian Institute of Technology, Kharagpur, India, is presented to show how the method is used. Copies of the computer program are available on request from the authors. (Skogerboe-Colorado State)

Water Resources Research, Vol 8, No 2, p 291-300, April, 1972. 6 tab, 4 fig, 21 ref.

Descriptors: *Salinity, *Irrigation practices, *Crop response, *Soil-water-plant relationships, Soil moisture, Soil chemistry, Crop production, Soil environment, Soil management, Agricultural engineering, *Soil water, Estimating.

The specification and estimation procedures of the response functions of crops to soil water content and salinity are presented. The conceptual framework is discussed, and the application of the suggested procedures is illustrated by an analysis of two irrigation experiments. The possibility of positive correlations between soil salinity, soil water content, and crop yield is discussed, and possible erroneous evaluations of the effect of salinity on crop yield in such situations are pointed out. SHAPE FACTORS IN IRRIGATION WATER ADVANCE EQUATION,
Uttar Pradesh Agricultural Univ., Naini Tal (India). Dept. of Agricultural Engineering.
P. Singh, and H. S. Chauhan.
Journal of the Irrigation and Drainage Division, American Society of Civil Engineers, Vol 98, No IR3, p 443-458, September, 1972. 10 fig, 1 tab, 9 ref.

Descriptors: *Irrigation practices, *Irrigation design, Hydraulics, *Surface irrigation, Flow, Irrigation engineering, *Infiltration rates, Soil mechanics, Soil physics, Irrigation.

Utilizing empirical advance and infiltration functions, relationships for surface and subsurface storage shape factors have been obtained. The surface and subsurface shape factors as expressed by these relationships are functions of time and infiltration characteristics of soil. Incorporating these relationships, a continuity equation has been written for advance in surface irrigation. The equation for advance of water compares well with field data and relationships of other workers. (Skogerboe-Colorado State)

ELEMENTAL COMPOSITION AND RESPONSE TO NITROGEN OF SUNFLOWER AND CORN,
Minnesota Univ., St. Paul. Dept. of Agronomy and Plant Genetics.
R. G. Robinson.
Agron J. Vol 65, No 2, 318-320, 1973.
Identifiers: *Corn(Field), Depletion, Irrigation, *Nitrogen, Nutrients, Soils, *Sunflower, *Fertilizers, Crop yield.

Comparison was made between sunflower (Helianthus annuus L.) and corn (Zea mays L.) yield, elemental composition, response to N fertilizer and removal of nutrients from the soil. The crops were grown on silt loam soil with and without N applied at various times and on sandy soil with and without N and irrigation. N at 75 to 150 kg/ha failed to significantly increase yield of either crop on fertile silt loam soils. On drought sand, N at 224 kg/ha increased sunflower yield but both irrigation and N were needed to significantly increase corn yield. Treatments within a trial did not affect elemental composition except where treatment altered yield. Sunflower achenes and vegetative parts had greater concentration of most elements than did corn. However, the higher yield of corn offset this and resulted in greater depletion of most elements. Concentrations are given of N, P, K, S, Ca, Mg, Na, Sr, Al, Fe, Mn, Cu, Mo, Mn, and B in corn and sunflower stover and leaves in prebloom stage and in mature sunflower achenes, sunflower stover, corn caryopses, and corn stover. Sunflower yields were 35-40% those of corn under favorable soil fertility and moisture conditions. Sunflower ranks below corn as a soil-depletive crop.--Copyright 1973, Biological Abstracts, Inc.

Identifiers: *Coastal waters, *Prawns.

Fish farming is one potential food source for the future. Some forms of seafood cultivation have been practiced since 475 B.C. Genetic control of aquatic creatures is important to produce fast growing animals on lesser amounts of food. First, the goal of aquaculturists is to raise fish from one generation to the next under controlled conditions. The few ventures in commercial aquaculture in the United States have concentrated on high priced luxury seafood items, grown from larvae captured in the wild. From 1954 to 1968 the ocean's fish yield tripled, but in 1969 the catch was over a million tons less than in 1968 even though there were more fishing vessels. Despite the fact that fish farming has been practised for centuries very little research has been carried out. If the ocean is to provide a new food source for the future, its yield must be increased by aquaculture. Research is needed with regard to particular species in order to determine the maximum yields. COMPLEX USE OF VOLGA WATER RESOURCES (KOMPLEKSNOE ISPOL'ZOVANIYE VODNYKH RESURSOV VOLGI),
I. N. Lisitsyna, and V. L. Ronin.
Gidrotekhnika i Melioratsiya, No 11, p 109-12, November 1973. 1 fig.

Descriptors: Water resources, *Water utilization, *Water control, *Irrigation systems, *Irrigation programs, Agriculture, Water conservation, Water pollution control.
Identifiers: *USSR(Volga River).

Average long-term runoff of the Volga River is more than half of all the water resources of river basins in the European south of the USSR. Principal water users in the Volga River basin are agriculture, the fishery economy, hydroelectric

wer, navigation, and industry. A total of 96 ir-ation and flood-irrigation systems have already en constructed or are scheduled for construc-n in the Volga River region. Water conservation easures deemed essential to the Volga basin in-ude: (1) industrial water recycling; (2) improve-nt in production technology and introduction of tional industrial processes; and (3) maximum rtailment of discharges of both treated and un-eated sewage into rivers and water bodies. The SU Central Committee and USSR Council of inisters in a 1972 decree 'On Measures to event Pollution of the Volga and Ural River sins With Untreated Sewage' have formulated easures aimed at complete treatment of sewage the basin by 1980. Continued growth of all anches of the national economy in the basin will sult in large irretrievable withdrawals of runoff. 1985, water consumption in the basin may ch 42 cu km/yr, and lead to changes in the ter balance of the Caspian Sea and to a decline sea level. Measures are outlined for stabilizing level of the sea and for preserving the rthern Caspian as a highly productive water dy. (Josefson-USGS)

Bot (Lond). Vol 37, No 149, p 225-232. 1973,
ntifiers: Membranes, *Organic molecules, rmeation, *Root systems, *Tomato roots, m, Glycols, Glucose, Raffinose.

neation of ethylene glycol, D-mannitol, L-glu-, and raffinose through excised tomato roots investigated. Solute transport from external tion to the xylem sap was determined at vari-rates of exudate flow achieved in turn by ap-ation of different pressures to the solution sur-ding the roots. At an applied pressure of 2 bar, dy-state solute concentrations expressed as a entage of external concentrations were, 52% ethylene glycol, 3-4% for mannitol and glu-cose, and 1% for raffinose. Such relationships between the chemical structure of the solute and its concentration in the xylem sap are similar to those demonstrated by other workers for solute permeation into single cells. Thus in the present experiments most of these solutes presumably flowed through at least one membrane before reaching the xylem. The data also indicate that the flow of water via wholly extracellular pathways was slight, at most, 1% of the total flow reaching the xylem via this route.--Copyright 1973, Biological Abstracts, Inc.

AN ECONOMIC ANALYSIS OF ALTERNATIVE SPRINKLER IRRIGATION DISTRIBUTION SYSTEMS ON THE SOUTHERN HIGH PLAINS OF TEXAS,
Texas A and M Univ., College Station. Dept. of Agricultural Economics and Rural Sociology.
R. D. Lacewell, and J. C. Pearce.
Resource Development Workgroup, Departmental Technical Report 73-4. September 1973. 91 p, 5 fig, 12 tab, 29 ref, 5 append.

Descriptors: *Irrigation systems, *Sprinkler irrigation, *Economic feasibility, Irrigation water, Pumping, Model, Recharge, *Texas, Water distribution(Applied).
Identifiers: *Ogallala Formation(Tex), Southern High Plains(Tex).

A model is presented for evaluating sprinkler irrigation distribution systems relative to their effect on the economic life and value of an exhaustible irrigation water supply. The model traces the beginning water resource situation and sequentially allocates irrigation water annually until economic exhaustion of irrigation water occurs. The area of study was the Ogallala Formation in the Southern High Plains of Texas which was determined to be an exhaustible aquifer because of a small annual recharge in comparison with the quantity of water pumped annually for irrigation use. Alternative systems investigated included the hand-move, side-roll, and pivot irrigation distribution systems. (Mastic-Arizona)

IRRIGATION SYSTEM,
R. P. Hammond, and J. W. Michel.
Available from the National Technical Information Service as PAT APPL-228 676(70), $3.00 in paper copy, $1.45 in microfiche. Atomic Energy Commission Patent Application Serial Number 228, 676(70), February 1972. 8 p, 3 fig.

Descriptors: *Patents, *Irrigation systems, *Subsurface irrigation, Arable land, Irrigation design, Irrigation efficiency, Irrigation systems, *Irrigation engineering, Pipes, Water distribution(Applied), Design.
Identifiers: *Trickle Irrigation.

Subsurface and trickle irrigation techniques have received attention in recent years as potential methods for increasing irrigation efficiency in the agriculture of arid lands. A spring mechanism is used on slits in plastic distribution pipe to control the size of the aperture at operating water pressures. Such a spring assures the opening of the slit at a given pressure and also increases the closing pressure. A detailed description of the system is presented as are several preferred embodiments. The system tends to make all the slits operate simultaneously in response to pressure pulses, which also clean the slits of debris. The length of pipe in each system may be increased due to the higher operating pressure, and gaseous fertilization may be introduced through the system. The system is economical in that it may be installed mechanically at low cost and it employs a smaller amount of irrigation water than other methods. (Muller-Arizona)

THE INFLUENCE OF DROUGHT ON THE GROWTH, YIELD AND COMPOSITION OF THE FIELD BEAN, (IN FRENCH),
Institut National de la Recherche Agronomique, Dijon (France).
S. Meriaux.
Ann Agron (Paris). Vol 23 No 5, p 533-546. 1972. Illus. English summary.
Identifiers: *Bean, *Drought, *Growth(Beans), Photosynthesis, Transpiration, *Crop yield, Crop production.

The plant shows a high rate of growth during pod formation. Drought does not affect the biochemical composition of the plant, apart from transient accumulative phenomena in a number of simple synthesis compounds. The yield of seeds and net photosynthesis are closely associated with transpiration. Seed yield depends on the duration of drought especially during the fruiting stage.--Copyright 1973, Biological Abstracts, Inc.

GUIDELINES FOR DEALING WITH FLOODS ON HAY CREEK.
Army Engineer District, Philadepa.
January 1973. 8 p, 3 fig.

Descriptors: *Floods, *Flood protection, Flood control, *Pennsylvania, *Flood plain zoning, Flood plain insurance, Non-structural alternatives.
Identifiers: Hay Creek(Penn).

The Hay Creek Watershed drains 22.2 square miles in Berks County. From its source, the stream flows in a northerly direction through Birdsboro into the Schuylkill River. The Borough of Birdsboro, located along the downstream reach, is completely urbanized with commercial properties, transportation facilities, and private residences and has been subjected to frequent flooding. The flooding problem can be attributed to the following causes: insufficient in-bank capacity to contain the quantity of flow which accompanies heavy rainfall; inadequate capacity of bridges to pass the quantity of flow which accompanies heavy rainfall; and backup from high stages in the Schuylkill River. Despite the expenditure of tax funds running into billions of dollars for flood-control works, the increase in flood damages has led to a new approach for reducing these damages. This approach is the application of control over the use of land lying adjacent to the river through the planned development and management of flood-hazard areas. While flood-plain areas can probably never be considered floodfree, planning will allow selection of a flood risk according to the type of development desired. This will assure a reasonable level of protection during initial construction of a project. In addition, measures are given for reducing or preventing flood damages. (Knapp-USGS)

EXTENDED PERIOD SIMULATION OF WATER DISTRIBUTION NETWORKS,
Systems Control, Inc., Palo Alto, Calif.
H. S. Rao, D. W. Bree, Jr., and R. Benzvi.
Available from the National Technical Information Service as PB-230 148; $5.00r copy, $1.45 in microfiche. Final Report, February 1974. 150 p, 29 ref, 1 append. OWRR-C-4164(9027)(1).

Descriptors: *Simulation analysis, *Water distribution(Applied), *Control systems, *Computer programs, *Networks, Model studies, California, *Reservoir operation, Design data, Pumps, Valves, Storage, Municipal water.
Identifiers: *Extended period simulation, San Jose(Calif).

An extended period simulation procedure was developed for metropolitan water distribution networks. Efficient sparsity programming techniques were applied to obtain static network balances using a modified Newton-Raphson technique. An integration scheme was developed to link several static solutions each representing an interval of time. A program, called WATSIM, was developed and tested using field data provided by the San Jose Water Works, San Jose, California. Data included network data, switching data, parabolic characteristics of pumps, reservoir curves, and time varying demand patterns. Three cases were simulated: normal operation, emergency operation, and pump outage conditions. A 24-hour simulation of a 325 node, 450 line network was performed on UNIVAC 1108 computer and took 8.5 minutes of execution time and included approximately 100 static balances. An analysis was also performed to determine research needs for computer control of water distribution systems. It was concluded that the development of extended period simulation capability is an important step in providing tools for analysis and control of water networks.

INTERNATIONAL MANAGEMENT OF TH RIO GRANDE BASIN - THE UNITED STA AND MEXICO,
University of Western Ontario, London. Dept Geology.
J. C. Day.
Water Resources Bulletin, Vol 8, No 5, p 935-
October, 1972. 3 fig, 18 ref.

Descriptors: *International waters, *Rio Gra River, *International Bound and Water Com *Water management(Applied), *United Sta *Mexico, Interstate rivers.
Identifiers: International water management.

Mexico and the United States forged a comm program to manage water and related land one Rio Grande. Actions of Rio Grande Commissa related to stream gaging, boundary definition, d multiple-purpose construction projects are amo the more successful international water-mane ment efforts in the world. Cost-sharing arra ments promoted rapid completing of internatial works. Joint action accomplished only part of expectations. International developments were co

petitive rather than complementary until basin water appropriation was virtually complete. Commissions were not employed to consider long-range competitive water needs, or regional water requirements, throughout the basin. International groundwater use coordination does not exist. International structures produce less than anticipated benefits. Hydroelectric generators are financial liabilities, irrigated acreage exceeds dependable streamflow, and soil salinization is experienced. Unanticipated environmental changes occurred in every major program. The Rio Grande experience points to the need for society to specify goals to which the use of water should contribute and specify priorities for water use among different sectors of river basins and various segments of society. RECESSION FLOW IN SURFACE IRRIGATION,
Hawaii Univ., Honolulu. Dept. of Agricultural Engineering.
T. Wu.
Journal of the Irrigation and Drainage Division, American Society of Civil Engineers, Vol 98, No IR1, p 77-90, March 1972. 6 fig, 1 tab, 9 ref.

Descriptors: *Surface irrigation, *Irrigation efficiency, *Surface runoff, *Recession curves, Furrow irrigation, Border irrigation, Irrigation systems, Irrigation engineering, Irrigation practices, Water storage, Flow.
Identifiers: *Recession flow.

The recession flow of furrow or border irrigation can be expressed as a simple power function which is derived by assuming a linear storage of recession flow. The flow length is expressed as a function of recession time and a constant. The knowledge of the length of recession flow profile and recession time is important in the evaluation of irrigation efficiency, especially in the border irrigation which has a relatively large volume of surface storage at the time when the inflow is shut off. Laboratory experiments were conducted and field data of sugarcane furrow experiments were applied to check the validity of the derived mathematical models. A simple recession flow equation is also derived by considering the recession flow as depleting water from a single shallow linear reservoir. For a relatively short length and small slope of furrow or border, the simple recession flow equation seems to be applicable. (Skogerboe-Colorado State)

GATHRIGHT LAKE, JACKSON RIVER, JAMES RIVER BASIN, VIRGINIA (FINAL ENVIRONMENTAL IMPACT STATEMENT).
Army Engineer District, Norfolk, Va.
Available from National Technical Information Service, Springfield, Va, 22151, as EIS-VA-73-0178-F, $1.45 microfiche. January 19, 1973. 501 p, 14 map, 2 chart, 9 tab, 12 illus.

Descriptors: Environmental effects, *Reservoirs, Surface waters, *Dams, Flooding(Intentional inundation), Backwater, *Flood control, Reservoir fisheries, Recreation, Water pollution, Flood flow, Floodways, Spillways, Water control, Damsites, Dam construction, *Virginia.
Identifiers: *Environmental Impact Statements, *Gathright Lake(Va).

The project is a complete construction of a multipurpose reservoir on the Jackson River, James River Basin, Virginia. A dam will provide a combination flood control, water quality control, area redevelopment, and recreation project within Bath and Allegheny Counties. A cold-water trout habitat will be created in the Jackson River, and a permanent warm-water fishery in the reservoir. About 2,530 acres of land will be permanently inundated removing from effective production all agricultural lands within the Gathright Wildlife Management Area. Approximately 400 people have been relocated. About 12 miles of the Jackson River will be foregone for such things as fishing, canoeing, etc. Wildlife habitats beneficial to turkey and deer production will be reduced. Twenty alternatives were considered. Among them were alternative dam sites, a system of small dams, flood plain zoning, flood insurance, purchase of flood plain, lagooning of pollution wastes, complete removal of pollutants and abandonment of the Gathright project. (Conko-Florida)
W74-05808

BIRCH LAKE, BIRCH CREEK, OKLAHOMA (FINAL ENVIRONMENTAL IMPACT STATEMENT).
Army Engineer District, Tulsa, Okla.
Available from National Technical Information Service, Springfield, Va, 22151, as EIS-OK-72-5319-F, $1.45 microfiche. September 1972. 183, 12 map, 48 tab, 27 chart.

Descriptors: *Environmental effects, *Dams, Surface waters, *Reservoirs, Flooding(Intentional inundation), Dam construction, Fisheries, Water control, Backwater, Water supply, Water storage, Water transfer, *Flood control, Water utilization, Recreation facilities, Wildlife habitats, *Oklahoma.
Identifiers: *Environmental Impact Statements, *Birch Lake(Okla).

This project is located on Birch Creek in Osage County about two miles south of Barnsdall, Oklahoma. It includes the construction of a dam and reservoir for purposes of flood control, water supply, water quality control, recreation, and fish and wildlife habitat preservation. The lake will significantly reduce annual flood damage and will provide a high quality water supply for the area. Low flow augmentation will enhance the downstream environmental setting by providing a more constant and stable flow of good quality water. The lake will provide an excellent recreational resource situated in scenic surroundings, readily available to large and growing urban areas. The lake will result in increased fishery but about 1,137 acres of wildlife habitat will be lost. Some oil recovery operations will be affected as well as county roads, pipelines, utility lines, and about 25 graves will have to be relocated. Possible alternatives included diversion of floodwaters, flood protection by levees, channel enlargement, development of Birch Creek as a recreational stream, and no action. (Conko-Florida)
W74-05809

NEW MELONES LAKE, STANISLAUS RIVER, CALIFORNIA (FINAL ENVIRONMENTAL IMPACT STATEMENT).
Army Engineer District, Sacramento, Calif.
Available from National Technical Information Service, Springfield, Va, 22151, as EIS-CA-72-4903-F, $15.75 paper copy, $1.45 microfiche. July 1972. 274 p, 25 chart, 8 map, 8 photo.

Descriptors: Environmental effects, *Reservoirs, Surface waters, *Dams, Flooding(Intentional inundating), Dam construction, Damsites, Water control, Backwater, *Flood control, Water utilization, Water supply, Water storage, Water transfer, Hydroelectric power, *California, Wildlife, Recreation.
Identifiers: *Environmental Impact Statements, *New Melones Lake(Cal).

This project consists of a dam across the Stanislaus River at New Melones Lake, California, to impound up to 2,400,000 acre-feet of water. The river below the dam will be maintained at a capacity of 8,000 cubic feet per second and provide for the protection of fish and wildlife resources. Flood protection will be provided for existing and potential agricultural lands and suburban areas of several communities. Other project benefits include general recreation, conservation yield, hydroelectric power generation, water quality control flows, and fish and wildlife. About 10,700 acres of land, much of which is used by wildlife, will be inundated along with 16 miles of river including the existing Melones Dam. The portion of the river that is presently used by whitewater boating enthusiasts will be inundated. There will be an overall net loss in wildlife population and a number of caves and archeological sites will be inundated. Project benefits will induce development in the region resulting in further loss of natural resources. Other alternatives considered were a smaller reservoir, reservoir at a different site, channel and levee improvement, flood plain management, and no action. (Conko-Florida)

THE ESTIMATION OF FLOOD FLOWS FROM NATURAL CATCHMENTS,
Transport and Road Research Lab., Crowthorne (England).
C. P. Young, and J. Prudhoe.
Available from NTIS, Springfield, Va 22151 PB-223 110; Printed copy $5.50 printed copy; $1.45 microfiche. Report LR-565, 1973. 63 p, 27 fig, 5 plate, 5 tab, 14 ref, 2 append.

Descriptors: *Peak discharge, *Rainfall-runoff relationships, *Runoff forecasting, Streamflow forecasting, Storm runoff, Flood forecasting. Identifiers: Road Research Laboratory method.

A method of estimating floodflows from natural catchments at desired return periods is based on rainfall and runoff data recorded on a continual basis for several years at natural catchments adjacent to motorways. A statistical analysis of the rainfall and streamflow data was used to determine the significant factors in an equation relating a time of concentration to catchment features. Peak rates of flow may then be calculated using the Bilham rainfall formula, the average annual rainfall fo the catchment, and the catchment area. The method is based on data from natural catchments with an underlying stratum of clay or boulder clay and, when tested on similar gaged catchments, gives reasonable agreement between the calculated and observed flows. The method is primarily for the calculation of peak rates of flow and is not intended for the determination of complete hydrographs. (Knapp-USGS)

LONG-DISTANCE TELEMETRY OF DATA FOR FLOOD FORECASTING,
Institute of Hydrology, Wallingford (England).
I. C. Strangeways, and L. Lisoni.
Nature and Resources, Vol 9, No 4, p 18-21, October-December 1973. 2 fig.

Descriptors: *Flood forecasting, *Telemetry, *Warning systems, Water levels, Floods, Data transmission.
Identifiers: *Brazil.

Telemetry methods are used in forecasting of floods in the Pantanal region of Brazil. The system is an easily maintained, reliable and comparatively low-cost radio telemetry system capable of transmitting measurements of river level and rainfall over large distances in areas difficult of access. It will permit forecasts of the level of the Paraguay River to be made, and is well suited to use in similar large undeveloped areas. (Knapp-USGS)
W74-05859

NATIONAL WEATHER SERVICE RIVER FORECAST SYSTEM, FORECAST PROCEDURES.
National Weather Service, Silver Spring, Md.
Available from NTIS, Springfield, Va. 22151 as COM-73-10517. Price $3.00 printed copy; $1.45 microfiche. NOAA Hydrologic Research Laboratory Technical Memorandum NWS HYDRO-14, December 1972. 252 p, 21 fig, 8 tab, 10 ref, 9 append.

Descriptors: *Streamflow forecasting, *River forecasting, *Model studies, *Digital computers, *Computer programs, Systems analysis, Input-output analysis, Hydrologic data, River basins, Methodology, Runoff forecasting, Weather forecasting, Hydrology.

The National Weather Service River Forecast System (NWSRFS) consists of several components such as data acquisition, forecast procedures, and forecast dissemination. This report describes a complete river forecast procedure and purposes: (a) a guide for implementation of conceptual river forecasting models by field offices, (b) a tool for use in testing and evaluating new concepts and procedures by the Hydrologic Research Laboratory (HRL), Silver Spring, Maryland, and (c) a vehicle for providing the results to others in the hydrologic community. Described are the techniques and programs needed for developing operational river forecasts based on the use of a continuous conceptual model, from the initial processing of basin data to the preparation of forecasts. The programs are written for a large-capacity digital computer and are generalized for use on any river system. Thus, they may or may not be the most efficient programs for use in a particular situation. (Woodard-USGS)
W74-05861

FLOOD PLAIN INFORMATION-BACK CREEI IN ROANOKE COUNTY, VIRGINIA.
Army Engineer District, Wilmington, N.C.
Prepared for Fifth Planning District Commissior May, 1972. 24 p, 12 figs, 16 pl, 5 tab.

Descriptors: Floods, Flooding, *Flood data *Flood forecasting, *Flood plains, *Virginia Flood control, Flow characteristics, Floo frequency, Flood recurrence interval, Maximur probable flood, Land use, River flow.
Identifiers: *Roanoke County(Virginia), *Bac Creek floodplain(Virginia), Intermediate Region Flood(IRF), Standard Project Flood(SPF), Floo Plain Management(FPM).

The Back Creek floodplain, approximately 3 mile south of the City of Roanoke, is largely ur developed. The Back Creek Basin is about 1 miles long with an average width of 3.5 miles. appears future development will include re sidences and small businesses. Agricultur development, some residences, small businesse and an auto raceway now exist. This report is in tended as an aid in future land-use planning an for management decisions concerning plain utiliz tion. Floods usually occur in the summer, fall, an winter, appearing quickly and with short duratior Most of the 35 bridges and culverts crossing th streams will be obstructive to floodflows. The Cit of Roanoke has placed some restrictions upo development in flood plain areas with agricultur facilities, public recreational areas, horse acade mies and stables being permitted. No flood contr projects exist or are authorized for the study are or upstream in the watershed. Floods occurred i 1948 and 1959, with floods of greater magnitud predicted since larger floods occurred in the pa on streams in the same geographic region and wit similar physiographical characteristics. Bac Creek areas inundated by an Intermediate Re gional Flood would include residences, bus nesses, and public utilities near Starkey, wit more severe problems in a Standard Project Floo Most of the 35 area bridges are high enough t escape inundation. In an Intermediate Proje Flood, water velocity would be 7-20 feet/second causing streambank and bridge abutment erosio slightly higher velocities would accompany a Star dard Project Flood. (Grden-North Carolina)
W74-05866

FLOOD PLAIN INFORMATION: NEUS RIVER-ADKIN BRANCH, CITY OF KINSTON NORTH CAROLINA.
Army Engineer District, Wilmington, N.C.
April, 1972. 34 p, 10 fig, 15 pl, 6 tab.

Descriptors: Floods, Flooding, *Flood data *Flood forecasting, *Flood plains, *North Carolina, Flood control, Flow characteristics Flood frequency, Flood recurrence interval, Maximum probable flood, Flood damage, River flow Floodwater.
Identifiers: *Kinston(N.C.), *Neuse River(N.C Intermediate Regional Flood(IRF), Standard Pro ject Flood(SPF).

Located on the Neuse River, Kinston is becomin an important eastern N.C. manufacturing an commercial center. The Neuse floodplain is broa and partially developed, with 40% of the lan woodland and 25% agricultural land. Pressure ex ists to develop land adjacent to highways in th floodplain for commercial and industrial use Major floods occur during all seasons, with th worst flood occurring in July, 1919. Under existin conditions future flood flow would cover a large part of Kinston. Quantities of floatable materia stored on floodplain lands may be carrie downstream causing severe damage to structure and clogging openings of bridges and culverts During an Intermediate Regional Flood wate velocity would reach 5 ft./second causing stream bank erosion; slightly higher velocities woul occur for a Standard Project Flood. Floodwater rise slowly and remain high for long periods. N

city or county regulatory measures specifically for the reduction of flood damage exist. Channel improvements along Adkin Branch which has a highly developed floodplain are expected to provide maximum protection from flooding from local runoff but will not materially reduce flood stages in the stream created by Neuse River floods. Construction of the Falls Lake project, a multi-purpose reservoir, to be located about 145 miles upstream from Kinston on the Neuse River is scheduled for completion in December, 1975. By controlling about 28% of the drainage area above Kinston, this project should have a regulating effect on the Neuse River at Kinston of about 2 1/2 feet depending upon the magnitude of flood events. (Grden-North Carolina)
W74-05867

FLOOD PLAIN INFORMATION - NEUSE RIVER, STONEY CREEK, AND LITTLE RIVER, GOLDSBORO, NORTH CAROLINA.
Army Engineer District, Wilmington, N.C.
February, 1972. 19 p, 24 pl, 9 tab.

Descriptors: Floods, Flooding, *Flood data, *Flood forecasting, *Flood plains, *North Carolina, Flood control, Flow characteristics, Flood frequency, Maximum probable flood.
Identifiers: *Goldsboro(North Carolina), *Neuse River(N.C.), Stoney Creek(N.C.), Little River(N.C.), Intermediate Regional Flood(IRF), Standard Project Flood(SPF).

Goldsboro is one of the largest cities serving the Coastal Plains agricultural area of North Carolina. Neuse River and its tributaries, Stoney Creek and Little River flow southward and drain a fairly large portion of the city. Flood plain development includes residential, commercial, and industrial development, with railroads, utility lines, sewage treatment facilities, and a hospital. Continuing urban expansion is expected into the flood plains. A city zoning ordinance restricts the use of a portion of Stoney Creek's flood plain but there are no ordinances for the other flood plains in or near Goldsboro. This study was requested to serve as a basis for development of flood plain management measures. Most flooding occurs in the spring and early fall, with flood flow obstruction created by 15 bridges and culverts and agricultural implements stored outside in the flood plain. Considerable damage to commercial, industrial and residential sections and to public and private utilities would occur during an Intermediate Regional Flood with maximum velocities that would occur in the main channel of the streams described ranging from 5.4 ft. per sec. to 5.9 ft. per sec. Low overflow banks would result in deposits of silt and debris, especially around bridges. A Standard Project Flood would create more severe damage because of higher velocities with channel flow, ranging from 6.5 ft. per sec. to 8.8 ft. per sec., wider extent, and greater depths of flooding. (Grden-North Carolina)

FEASIBILITY OF COMBINED SOLID WASTE AND STORM DRAINAGE PROJECTS.
Denver Regional Council of Governments, Colo.
Available from the National Technical Information Service as PB-224 108; $4.25 in paper copy, $1.45 in microfiche. Project REUSE Final Report (Supplement), June, 1972. 42 p, 2 tab, 11 fig. HUD COLO-USE-1. DHUD-H-1392.

Descriptors: *Feasability studies, *Waste disposal, *Storm drains, *Multiple-purpose projects, *Landfills, *Colorado, Solid wastes, Water, Water pollution, Water quality, Urban drainage, Reservoirs, Flood plain, Flood control, Runoff, Sanitary engineering.
Identifiers: *Denver(Colorado), Gravel pits, Project REUSE, Detention ponds, Solid waste management, Sanitary landfills.

Project REUSE demonstrates the feasibility of detention ponding adjacent to a sanitary landfill site, using abandoned gravel pits, to combine urban drainage and flood control with solid waste management in Denver, Colorado. Constraints for the region include use of gravel pits, location in a flood plain, and local hydrological factors. Three approcahes developed include on-stream detention ponds upstream of dikes formed by solid waste landfill, use of landfill to fill existing gravel pits for land reclamation, and use of abandoned gravel pits to provide detention storage. Sites were evaluated, and the Littleton Recreation Area was selected for the first approach. Results show problems with water pollution and economic feasibility due to small scale. Further research is needed, including developing dike-top flood erosion protection and more effective plastic and butyl rubber lines for landfill isolation, to make these approaches feasible. Sanitary landfill minimizes detrimental effects incurred by urban systems, and detention ponds reduce flood damage by controlling runoff. Synergistic benefits could occur in a multi-purpose project, including landforms built of landfilled material, increased environmental protection and economy, and reservoirs constructed over landfills. (Grden - North Carolina)

THE PHYSICAL SETTING OF THE COLORADO RIVER BASIN,
California State Water Resources Control Board, Sacramento.
W. D. Maughan.
American Association for the Advancement of Science 140th Paper presented at meeting, San Francisco, Feb. 1974. 16 p, 11 ref.

Descriptors: River basins, *Mexican Water Treaty, *Interstate rivers, *River basin development, *Salinity, *Colorado River basin, Colorado River Compact, Rocky Mountain Regions, Rivers, Arizona, California, Colorado, Water resources development, River systems, Water quality, Water pollution, Return flow, Irrigation, Geologic history, Geomorphology, Erosion.

Physical and historical aspects of the Colorado River Basin are described. The topography of the Basin is presented, with emphasis on the tributaries and on the Colorado River itself. A detailed geologic and morphologic history of the basin describes the origin of the erosional features for which the region is so famed. Mineral resources of the area are judged significant in crude oil, oil shale, coal, copper, uranium, molybdenum, trona and limestone. These resources acquire additional importance in light of the present energy crisis. Short descriptions of land resource utilization, water supply, and population are presented. The water quality problem of the Colorado River is discussed from a historical point of view. The changes of water quality along the river are described. The extensive water resources development along the Colorado is discussed in relation to the water quality of the river system. (Muller-Arizona)

An ever-increasing number of often conflicting demands are being placed on the National Forests of the United States. The resource policy of the Forest Service must change in correspondence with these changing demands. Economic values must now be considered in such policy. The 10,000-acre study area north of the Mogollon Rim in Arizona is used to illustrate this consideration. In this area, timber, range water and recreation compete for the use of the forest. About two-thirds of the runoff goes into the Little Colorado while one-third enters the Salt and Verde Rivers. The increment of this water is calculated with respect to downstream users and compared to the incremental values of the competing demands. The price for these demands is compared to the ability to pay for the demand and this bracket is used to identify the marginal value of the demand which is used in the economic decision making process in forest management policy. INTERREGIONAL PLANNING OF WATER RESOURCES ALLOCATIONS BY SYSTEMS ANALYSIS APPROACH,
Utah Water Research Lab., Logan.
J. E. Keith, J. C. Anderson, A. B. King, M. H. Anderson, and T. C. Anderson.
A Summary Report, PRWG 100-5, July 1973. 41 p, 14 fig, 14 tab, 65 ref, append.

Descriptors: *Water supply development, *Utah, *Water allocation(Policy), *Water demand, *Water delivery, *Water utilization, *Economic efficiency, Linear programming, Optimization, Planning, Costs, Constraints, Methodology, Marginal costs, Systems analysis, Mathematical models.

Water allocation in Utah involves considering: (1) the allocation of water itself; and (2) the allocation of water-related resources necessary to distribute the water, both of these requiring relatively large investments of public funds. The availability of and demand for water were studied using a systems approach. A supply and demand model was used to determine efficient (optimal) allocations; since the problem is highly complex, mathematical programming techniques using computer technology were utilized, enabling the generation of optimum values for the variables as well as shadow prices which represent marginal cost or value of those variables. The general objective was to develop a methodology for determining optimal allocations of water in Utah, given alternative assumptions and constraints. The approach was to structure a statewide model of water use and delivery in a linear programming framework, explicitly including the water supply system, various water demands, and alternative water salvage, reuse, and transfers under consideration by water planners. Optimal solutions to the statewide programming model were based upon maximizing net economic returns to water use in the state, given

the alternative assumptions, and were therefore the economically efficient allocations of Utah's water supplies. Given the determination of the efficient allocations over the projected time frame, the economic costs of prematurely investing in transfer facilities or of limiting the use of low-cost water sources were estimated using losses in producers' and consumers' surplus. OPTIMUM RESERVOIR OPERATING POLICIES AND THE IMPOSITION OF A RELIABILITY CONSTRAINT,
New South Wales Univ., Kensington (Australia). School of Civil Engineering.
A. J. Askew.
Water Resources Research, Vol 10, No 1, p 51-56, February 1974. 1 fig, 4 tab, 13 ref.

Descriptors: *Reservoir operation, *Dynamic programming, *Simulation analysis, Economics, Methodology, *Probability, *Failures, *Stochastic processes, Water supply, Reservoir releases, *Optimization, Mathematical models, Systems analysis.
Identifiers: Operating policy, Benefit maximization.

Stochastic dynamic programming provides a very efficient means of deriving optimum operating policies that maximize the expected net dollar benefits for a water resource system. These policies may give rise to significant probabilities of system failure. Such probabilities can be estimated by system simulation. An iterative procedure is proposed in which the combined use of dynamic programming and simulation allows an optimum operating policy to be derived that will maximize the expected net benefit and at the same time will restrict the probability of failure to an acceptable level. Limitations to failure are applied directly by imposing a fixed penalty on the system whenever it fails, thus inducing amendments in the optimum policies derived. Further developments of the technique are foreshadowed. (Bell-Cornell)

OPTIMAL DESIGN AND OPERATION OF WATER DISTRIBUTION SYSTEMS,
Thomas J. Watson Research Center, Yorktown Heights, N.Y.
U. Shamir.
Water Resources Research, Vol 10, No 1, p 27-36, February 1974. 1 fig, 2 tab, 31 ref.

Descriptors: *Water distribution(Applied), *Design, *Operation and maintenance, *Methodology, Economics, Constraints, Performance, Physical properties, Optimization, Pipes, Flow, Reservoirs, Water levels, Hydraulics, Costs, Computer programs, Mathematical models, Systems analysis, Equation.
Identifiers: *Looped networks, *Newton-Raphson method, Operating policy, Sensitivity, Analysis.

A methodology is developed for optimal design and/or operation of a water distribution system that is to operate under one or several loading conditions. Decision variables may be design variables, such as pipe diameters, or control variables, such as heads and flows. The general formulation considers the cost of the design and the cost of operating the system. The objective function may include the initial cost of the design, the cost of operation, the physical measures of performance, and the penalties for violating constraints. Constraints may be imposed on the decision variables and on the performance of the system under each loading. The model for the flow problem is based on node equations. Flow solutions are obtained by a modified Newton-Raphson method employing sparse matrix techniques. Optimization is obtained by a combination of the generalized reduced gradient and penalty methods. Implementation in a computer program and its use on a test problem in both batch and time-sharing modes are described, and it is concluded that the method is computationally feasible. The many different ways in which it can be used to analyze, design, and operate water distribution systems are outlined. (Bell-Cornell)

MODELING THE REGULATION OF LAKE SUPERIOR UNDER UNCERTAINTY OF FUTURE WATER SUPPLIES,
Sun Oil Co., Dallas, Tex.
S. Y. Su, and R. A. Deininger.
Water Resources Research, Vol 10, No 1, p 11-25, February 1974. 13 fig, 7 tab, 11 ref, 3 append.

Descriptors: *Lake Superior, *Regulation, *Water levels, *Markov processes, *Water supply, *Stochastic processes, Optimization, Algorithms, Inflow, Mathematical models, Systems analysis, *Risks.
Identifiers: Operating policy, Economic loss functions, Data, Sensitivity analysis.

The regulation of the water levels of Lake Superior, via control at its outlet, has been considered. A general one-lake system is described, for which an optimization model is then developed, and a method for finding an optimal operating policy is introduced. The inflows to the lake are treated as stochastic random variables. The objective was to find operating policies that minimized the expected undiscounted yearly losses over an infinite time horizon. The system was modeled as a periodic Markovian decision problem. A new algorithm based on White's method of successive approximations for solving single chained and completely ergodic Markovian decision problems was developed and proven to be fairly efficient in terms of computer storage and computation time. Transition probabilities of the inflows were estimated from 64 years of data. The economic loss functions used in the model considered the losses due to navigation inconvenience and shore property damage. An extensive sensitivity analysis was conducted to determine their influence on the optimal operating policies. To show the validity of the model, the newly developed policies were tested against the current operating policy by using the historical inflow record as data. The results show that if some of the developed operating policies were adopted, the average yearly losses could be reduced by at least 15%. Concurrently, monthly lake level variances could be reduced by 25%. (Bell-Cornell)

SUBSURFACE ASPHALT MOISTURE BAI RIERS IN SANDY SOILS,
Delaware Univ., Newark. Dept. of Agricultur Engineering.
E. N. Scarborough, and W. C. Liebhardt.
Available from the National Technical Inform tion Service as PB-229 518, $4.00 in paper cop $1.45 in microfiche. University of Delawa Agricultural Experiment Station Bulletin 401, Jun 1973. 15 p, 10 fig, 4 tab, 6 ref, append. OWRR A 012-DEL(2).

Descriptors: *Groundwater barriers, *Soil wat movement, *Leaching, *Fertilizers, Sands, Wat pollution control, Soil-water-plant relationship Crops, Nitrates.
Identifiers: *Soil water barriers.

A subsurface asphalt moisture barrier as an aid soil moisture retention and reduction of nitra leaching in sandy soils was investigated. In fie studies with six vegetable crops grown on loam sand soils, average yield increases of all crop over the barrier were 46%, 58%, and 55% for 196 1968, and 1969, respectively. Yield increases we the result of increased water retention of the so and reduced nitrate leaching from excessive rai fall. In laboratory leaching studies using high rat of nitrogen, the mean nitrate movement was ap proximately six inches of soil depth per inch water applied. Approximately 2-1/2 times as muc nitrate remained in the top two feet of soil over th barrier compared to when no barrier was used an five inches of water was applied. The aspha moisture barrier is an effective production tool fo growing vegetable crops in sandy soil where irrig tion is not feasible, especially under conditions short periods of drought and occasional heav rainfalls. VAILABILITY OF GROUND WATER IN THE EDERAL WAY AREA, KING COUNTY, /ASHINGTON,
eological Survey, Tacoma, Wash.
. R. Cline.
pen-file report, 1969. 60 p, 6 fig, 4 tab, 4 ref, ap-end.

Descriptors: *Groundwater, *Water yield, Hydrogeology, Hydrologic data, Washington, Aquifers, Drawdown, Glacial drift.
Identifiers: King County(Wash).

The availability of large supplies of groundwater was studied in the Federal Way area in southwestern King county. The most productive aquifer in the 31-square-mile area is a deposit of sand and gravel that underlies glacial till in the central part of the area. Most of the wells that tap groundwater in this buried glacial channel will yield more than 500 gpm, and one well produces 2,600 gpm. The wells here have specific capacities of 10 gpm or more per foot of drawdown. Coefficients of transmissibility of the aquifer range from about 200,000 to 600,000 gpd per foot. Annual recharge to the groundwater reservoir in the area is by local precipitation and is estimated to average about 16 inches, or about 8.8 billion gallons. Probably no more than about one-half of this, or 4.4 billion gallons per year, can be withdrawn through wells without causing undesirable effects, such as excessive declines of groundwater levels and of the low flows of streams draining the area. The amount of water pumped in 1967 by Water Districts 64 and 100 was 1.03 billion gallons, an increase of 65% in just 2 years. Much of the water withdrawn probably returns to the groundwater reservoir through percolation from septic tanks and drain fields. (Knapp-USGS)

A SUMMARY ON GROUND WATER IN THE HAN RIVER BASIN, REPUBLIC OF KOREA,
Geological Survey, Reston, Va.
J. T. Callahan, and Il Choi Seung.
Reprint from The Memoirs for Professor Chi Moo Son's Sixtieth Birthday, December 1972. 4p.

Descriptors: *Groundwater resources, *Water wells, *Water quality, *Hydrogeology, *Foreign countries, Water supply, Water utilization, Aquifer characteristics, Pumping, Water yield, Groundwater recharge, Storage capacity, Water resources development, Projections, Reviews.
Identifiers: *Han River basin(Korea), *Republic of Korea.

The Han River basin occupies 26,200 sq km, most of the northern fourth of the Republic of Korea, and extends north of the Demilitarized Zone (DMZ) into North Korea. The basin also includes the Imjin River basin which was not included in this investigation because it is within the DMZ at its confluence with the Han River, and much of its area is military controlled or north of the DMZ. In 1969 groundwater use in the Han River basin was estimated to have been about 330 million cu m, about 17% of the total water requirement. The estimated annual yield of groundwater from the bedrock aquifers is at least 4,000 million cu m, and that of the alluvial sand and gravel deposits is at least 5,000 million cu m. Groundwater in storage in the bedrock and alluvium is estimated to be about 62,000 million cu m. Annual pumpage of about 3% of storage will meet the projected groundwater requirement of the year 2001 (2361 million cu m). On the average groundwater pumped from storage will be recharged annually during the summer rainy season. The chemical quality of groundwater is good for irrigation and municipal use and most industrial uses. Total dissolved solids are usually less than 300 mg/liter. Sewage effluents have caused pollution of many shallow wells in villages. (Woodard-USGS)

To integrate operation of ground and surface water supplies into their management plans, decision-makers must be able to predict the effects of various alternative modes of operation and meteorological conditions on the groundwater basin. Many types of models have been used for simulating the behavior of groundwater basins under these changes. Analog simulators, analog computers, and digital computers have been employed for model development. To achieve plausible models, detailed hydraulic and hydrologic characteristics are required, such as data on transmissivity, storage, and net deep percolation. These data are used in the equations that form the model. Water quality, which cannot be separated from quantity, deserves equal consideration. Recently, considerable efforts have been made to develop water quality prediction tools through the use of modeling techniques. (Skogerboe-Colorado State)

Descriptors: *Hydrogeology, Kansas, *Alluvial channels, *Groundwater, Conjunctive use, Induced infiltration, Aquifer characteristics, Aquifer testing, Water yield, Transmissivity.
Identifiers: *Kansas River Valley(Kan).

The combined river and alluvial-aquifer systems are the principal source of water for municipal, industrial, and irrigation supplies along the Kansas River valley in northeast Kansas. The depth to water in the valley-fill deposits ranges from 0 to 50 feet below land surface and averages about 25 feet. The valley-fill deposits contained about 1 million acre-feet of groundwater in storage in 1967. Wells yielding more than 1,000 gallons per minute are common. Transmissivity ranges from 5,300 to 48,000 square feet per day and the long-term storage coefficient was estimated to average 0.15. The chemical quality of the groundwater is suitable for most uses; however, the water is generally very hard and may contain as much as 58 milligrams per liter of total iron. (Knapp-USGS)

Descriptors: *Channel improvement, *Planning, Runoff, *Land use, *Urbanization, Sedimentation, *Streamflow, *Flood frequency, Pennsylvania, Maryland, District of Columbia, *Forecasting.
Identifiers: Channel enlargement.

Empirical relationships are derived (1) between types of locations and amounts of urban land use and channel enlargement as compared with natural channel size, (2) between channel enlargement and stream flow, and (3) between extent of urbanization and floods of different frequencies. Highly significant relationships were found, based on large numbers of observations. The relationships are applied for purposes of prediction of hydrologic impacts and land use planning. The process of channel enlargement and channel configuration change is studied through permanent measuring stations on five gaged urban streams.

Identifiers: Surface slicks, *Surface microlayers.

Four surface microlayer sampling devices we compared. The objective of this comparison w to determine relative sampling efficiencies a depths in which water was collected by each sar pler. The results showed that the plate and dru samplers were far superior to the screen and tr samplers in sampling efficiency and in collecting thin surface microlayer. Also several paramete of freshwater surface microlayers were compare to those of water from a 10-cm depth in thr

iquatic environments. The results showed that surface microlayers were often microbiologically and chemically enriched, compared to the subsurface water. The freshwater surface microlayers may have major roles in the recycling of nutrients, incorporation of toxicants into food chains, and the creation of aerosols containing coliform and pathogenic bacteria. Furthermore, the study of surface microlayers offers a sensitive technique of monitoring aquatic environments for certain pollutants such as coliform bacteria, heavy metals, and many pesticides.

WATER QUALITY CRITERIA, SECOND EDITION.
California State Water Resources Control Board, Sacramento.
Publication 3-A, Revised 1963. 548 p, 4 fig, 33 tab, 1,827 ref. Edited by J. E. McKee and H. W. Wolf.

Descriptors: *Water quality standards, *Reviews, *Bibliographies, State governments, Interstate, Legal aspects, Legislation, *Beneficial use, Pollutants, *Radioactivity, *Pesticides, *Toxicity, *Lethal limit, *Water quality control, Water pollution.
Identifiers: Surface active agents.

This January 1973 reprint report serves as a compendium of current literature on the subject of water-quality criteria, and attempts to present the material in a manner that will be most useful to the water-pollution-control boards and their staffs. For this purpose, the report has been cross-referenced extensively. The bulk of the report consists of summaries of literature relating to threshold and limiting concentrations for each potential pollutant with respect to each beneficial use of the water. Each substance or waste that may enter the waters of the State is deemed to be a 'potential' pollutant--potential in the sense that, if concentrated sufficiently, it can adversely and unreasonably affect such waters for one or more beneficial uses; and yet, if diluted adequately, it will be harmless to all beneficial uses. Chapters include: Water Quality Criteria Promulgated by State and Interstate Agencies; Judicial Expression; Quality Criteria for the Major Beneficial Uses of Water; Potential Pollutants; Biological Pollutants; Radioactivity; Pesticides; and Surface Active Agents. ENVIRONMENTAL RADIATION SURVEILLANCE OF THE OYSTER CREEK NUCLEAR GENERATING STATION.
New Jersey Dept. of Environmental Protection, Trenton. Div. of Environmental Quality.
Report, July 1973. 121 p, 2 fig, 40 tab, 16 ref. EPA 68-01-0527.

Descriptors: *Survey, *Assay, *Measurement, *Radioactivity, *New Jersey, Nuclear powerplant, Effluents, Cooling water, Bays, Water pollution, Radioisotopes, Air pollution, Fallout.
Identifiers: *Barnegat Bay(N.J.).

New Jersey has maintained an environmental surveillance program for the Oyster Creek Nuclear Generating Station owned by the Jersey Central Power and Light Company since 1965. During 1971 the State initiated a comprehensive environmental study of the plant characterizing the distribution of facility-oriented radionuclides in the various biological and physical components of Barnegat Bay. In April of 1972, the State entered into contract with the U.S. Environmental Protection Agency to provide offsite environmental radiation surveillance data relative to the Oyster Creek facility. Scientific equipment was obtained in order to enable the State to evaluate many of the radiological aspects which were not evaluated in 1971. A summarization is presented of the data and the endeavors of the Bureau of Radiation Protection during the past year. (Houser-ORNL)

A NEW BENZENE-ETHANOL-WATER SOLVENT SYSTEM FOR TLC SEPARATION OF AFLATOXINS,
Best Foods Research Center, Union, N.J.
A. E. Waltking, G. W. Bleffert, M. Chick, and R. Fogerty.
Journal of the American Oil Chemists' Society, Vol 50, No 10, p 424-425, October 1973. 1 tab, 3 ref.

Descriptors: *Separation techniques, Aqueous solutions, *Gas chromatography, Solvents, *Chromatography, Organic compounds.
Identifiers: *Aflatoxins, Thin layer chromatography, Gas liquid chromatography, *Solvent systems, Chemical composition, *Benzene, *Ethanol, Mycotoxins.

Gas liquid chromatography was used to determine the composition of the benzene-ethanol-water (BEW) solvent system frequently used in the separation of aflatoxins by thin layer chromatography. Investigation of a rapid procedure for preparing and using this solvent system led to the discovery of a new BEW solvent system with advantages for the routine determination of aflatoxins in roasted nut products, which consists of benzene-ethanol-water 40:6:3 for the trough solution and 4:27:20 for the bottom solution. Because ethanol is the most costly reagent in this solvent system and the bottom layer contains four times as much ethanol as the top layer, it is worthwhile to use the bottom layer repeatedly. The instantly prepared BEW system containing benzene-ethanol-water 41:7:1 in the top layer and 5:28:18 in the bottom layer was used in our laboratory almost exclusively for over a year with repeatedly excellent resolution. The bottom layer (50 ml) was not replaced or supplemented during an entire week's operation, which ranged between 5 and 20 plates, while 25 ml of the top layer was pipetted into a clean trough for each run. Evaluation of this system by six laboratories over the past year has shown it to be consistently superior to the previous BEW solvent system and less affected by climatic conditions. Optimum results are obtained by placement of the developing chamber in a constant temperature cabinet at 68-70F. (Mortland-Battelle)

A STUDY OF THE STABILITY OF A NITROGEN-SELECTIVE THERMIONIC DETECTOR,
Laboratory of the Government Chemist, London (England).
T. A. Gough, and K. Sugden.
Journal of Chromatography, Vol 86, No 1, p 65-71, November 1973. 4 fig, 6 tab, 18 ref.

Descriptors: Stability, *Gas chromatography, *Pollutant identification, Nitrogen, Aqueous solutions, Selectivity.
Identifiers: *Thermionic detector, *Flame ionization detector, Comparative studies, *Nitrogen detector, *Nitrosamines, Performance evaluation, Dimethylnitrosamines, Diethylnitrosamines, Dipropylnitrosamines.

The stability of a thermionic detector fitted with a rubidium chloride tip has been studied by comparison with the performance of a conventional flame ionisation detector. The variations of response of the detectors to a given set of conditions over an extended period of time have been measured. A Pye 104 Chromatograph fitted with thermionic (TD) and flame ionisation detectors (FID) was used. A primary standard solution containing 100 microliters/l of dimethyl-, diethyl-, and dipropylnitrosamines (DMN, DEN and DPN) in water was used throughout the study. 3-microliter aliquots of this and other standards, prepared by dilution, were injected daily over a period of several weeks in order to follow the variations of response of the two detectors. Variations of response of the TD are significantly higher than those of a conventional flame detector. The sensitivity of the TD falls with age, but can be restored by cleaning the probe. For some simple nitrosamines response is a function of nitrogen content. Analysis of dirty extracts does not subsequently affect the sensitivity of the TD. The noise level and detection limits for the nitrosamines are at least an order of magnitude higher on the TD than on the FID. (Mortland-Battelle)

AN AUTOMATIC SAMPLE LOADER FOR COLUMN CHROMATOGRAPHY,
Commonwealth Scientific and Industrial Research Organization, Melbourne (Australia). Div. of Protein Chemistry.
H. Lindley, R. W. Cranston, W. J. A. Sutherland, and C. L. Ritchie.
Journal of Chromatography, Vol 86, No 1, p 178-183, November 1973. 4 fig, 2 ref.

Descriptors: *Automation, Amino acids, Instrumentation, *Chromatography, Automatic control, *Sampling.
Identifiers: *Column chromatography, *Sample loader, Programmer, Controller.

An automatic sample loader is described that has been used continuously for 3 years with an amino acid analyzer. An electronic programmer controls loading, all timed sequences, a six-position, 10-channel buffer flow valve, and the pumps. Samples are loaded through two discs with four pairs of holes each. These discs are held together by spring pressure and sealed by neoprene 'O' rings recessed into the top disc. The buffer pumps, lines, and connections are held by the stationary top disc. Sample coils, with identical volumes, are held by the rotating bottom disc. Sample overlap is allowed at each end through control of pumping time and use of sample coils of slightly less volume than the sample used. This prevents the loading of air. Approximate loading time is three minutes. Desirable features of the system include: (1) single-dual-column loading, (2) ease of adding or subtracting samples during operation, (3) automatic introduction of samples into the sample loops, and (4) low cost. A possible criticism of the apparatus is the chance evaporation or contamination of samples because the sample cups are not completely sealed. Several points in answer to this criticism are discussed. (Mortland-Battelle)

METAPERIODATE - A NEW STRUCTURE-SPECIFIC LOCATING REAGENT FOR PHENOLIC COMPOUNDS,
University of Strathclyde, Glasgow (Scotland). Dept. of Food Science.
M. N. Clifford, and J. Wight.
Journal of Chromatography, Vol 86, No 1, p 222-224, November 1973. 1 tab, 3 ref.

Descriptors: *Phenols, Aqueous solutions, Ethers, *Chromatography, *Pollutant identification.
Identifiers: *Metaperiodate, *Paper chromatography, *Chromogenic reagents, Dihydroxyphenols, Monomethyl ethers.

The use of metaperiodate as a reagent in detecting phenolic compounds and its structure specificity were investigated. Several compounds listed were dissolved in propan-2-o1 (70 percent w/v) at a concentration of 5 mg/ml. Saturated 5 percent w/v and 0.5 percent w/v aqueous solutions of analytical grade potassium metaperiodate were used as spray reagents. A sheet of Whatman No. 1 chromatography paper was sprayed with one of the metaperiodate solutions and allowed to dry. Each phenolic solution was applied to the metaperiodate-treated papers at levels of 1, 5 and 10 micrograms using a micro-pipette. Failure to produce a detectable color within 10 min was taken as a negative response. Metaperiodate (0.5 percent) detected microgram quantities of o-and p-dihydroxyphenols and their monomthyl ethers by producing a yellow-orange color. This response was essentially independent of other substituents (carboxyl, hydroxyl, methoxyl, propenoic acid), but vanillin, vanillic acid and methyl vanilloyl ketone responded less readily, a 5-microgram loading being necessary to give a positive response. In all other cases a 1-microgram loading was detected. (Mortland-Battelle)

SPECTROPHOTOMETRIC DETERMINATION OF URANIUM(VI) WITH 7-CHLORO-8-HYDROXYQUINOLINE-5-SULPHONIC ACID,
Birla Inst. of Tech. and Science, Pilani (India). Chemical Labs.
B. K. Avinashi, and S. K. Banerji.
Microchemical Journal, Vol 18, No 5, p 543-547, October 1973. 2 fig, 14 ref.

Descriptors: *Spectrophotometry, *Aqueous solutions, *Chemical analysis, *Methodology, Pollutant identification, Cations, Anions, Chelation, Pollutants, Hydrogen ion concentration, Time, Temperature.
Identifiers: *Chromogenic reagents, *Uranium, Ionic interference, Metal chelates, Absorbance, Precision, Trace levels, Chemical indicators, Complexation, 7-Chloro-8-hydroxyquinoline-5-sulfonic acid, Chemical concentration, Chemical composition, Chemical structure, Molar absorptivity, Chemical interference.

Uranium(VI) and 7-chloro-8-hydroxyquinoline-5-sulfonic acid form a 1:2 orange-red complex with gamma sub max at 355 nm, in aqueous solution at pH 6.6. An aliquot of standard uranium solution (38 ppm) is combined with a pH 6.6 buffer, 1 M NaCl04 and 0.002 M reagent. The volume is adjusted to 25 ml with distilled water and the mixture allowed to stand for 30 minutes to attain equilibrium. Absorbance was measured against the reagent blank at 355 nm. The color of the uranium complex develops instaneously and remains constant for at least 24 hours at room temperature. With an increase in temperature, a decrease in the value of absorbance of the complex was observed. A study of the effect of reagent concentration at a pH 6.6 plus or minus 0.1 and 355 nm indicated that there should be at least 6 fold molar excess of the reagent over U(VI) concentration for maximum color formation of the complex. Varying the order in which the reagents were added had no significant effect on the results. Range for adherence to Beer's law, effective photometric range, molar absorptivity, and Sandell sensitivity are reported as 1-38 ppm, 5.7-28.5 ppm, 6575 and 0.036 microgram of uranium/sq cm, respectively. The method has been compared with some other methods for determination of uranium spectrophotometrically, with regard to their sensitivities. Interferences of various ions in the measurement of the color have been investigated, and the tentative structure of the colored species has been proposed. (Holoman-Battelle)

MICRODETERMINATION OF THIOCYANATES WITH N-BROMOSUCCINIMIDE USING BORDEAUX RED AS AN INDICATOR,
Pakistan Council of Scientific and Industrial Research, Lahore.
M. Sarwar, H. A. Waheed, M. A. Chowdhri, and R. J. Thibert.
Mikrochimica Acta, No 5, p 683-688, 1973. 3 tab, 12 ref.

Descriptors: *Volumetric analysis, *Aqueous solutions, Methodology, Chemical analysis, *Pollutant identification, Chemical reactions.
Identifiers: *Thiocyanates, *Bordeaux red, Chemical indicators, *Bromosuccinimide, Precision, Accuracy, Chromogenic reagents.

N-bromosuccinimide has been used as a direct titrant for thiocyanates with bordeaux red as an indicator. In case of ammonium thiocyanate, nitrogen is evolved. While in case of potassium thiocyanate 0.5- to 2-mg samples were analyzed and maximum relative standard deviation was 1 percent in case of 0.5-mg sample. In case of ammonium thiocyanate 0.3- to 2.5-mg samples were analyzed and maximum relative standard deviation was 0.9 percent in case of 0.7-mg sample. The method is quick, precise and accurate. (Holoman-Battelle)

THE DETERMINATION OF BARIUM BY FLAMELESS ATOMIC ABSORPTION SPECTROPHOTOMETRY USING A MODIFIED GRAPHITE TUBE ATOMIZER,
G. D. Renshaw.
Atomic Absorption Newsletter, Vol 12, No 6, p 158-160, November/December 1973. 4 fig, 1 tab, 13 ref.

Descriptors: *Pollutant identification, Separation techniques, Solvent extractions, Aqueous solutions, *Spectrophotometry.
Identifiers: *Barium, Flameless atomic absorption spectrophotometry, *Graphite furnace, Atomization, Tantalum liner.

Sensitivities for barium determination are compared by flameless atomic absorption spectrophotometry employing an HGA-70 Graphite Furnace both with and without a tantalum cylinder insert. The mode of barium atomization within the furnace is discussed with reference to carbon-metal atom interactions in order to explain sensitivity differences. A solvent extraction method for the preconcentration of barium, prior to determination in the modified carbon tube furnace, is also mentioned. Solutions containing 1-10 ng Ba/20 microliters were prepared by dilution with distilled water of a 1000 micrograms/ml (w/v) stock solution of barium in 0.1 N HClO4. The solutions were stored in polythene bottles previously soaked in 10 percent HNO3. Analytical grade thenoyltrifluoroacetone (TTA) was dissolved in metyl isobutyl ketone (MIBK) to make a 0.1 M solution. Thymol blue was used as an internal indicator. The tantalum cylinder inserts (liners) were constructed from 0.002-in thick foil (99.9 percent purity). It is estimated that the lifetime of a liner would be equivalent to at least 200 determinations and each liner costs only a fraction of the cost of the replacement carbon tubes. With the tantalum liner insert, the sensitivity increased twenty fold. The detection limit (defined as signal:noise ratio equals 2) with the modified tube is 10. In terms of concentration, the detection limit, assuming one uses the maximum sample volume of 100 microliters is 0.001 ppm). Comparison with the conventional flame nebulizer shows a hundred-fold increase in sensitivity. (Mortland-Battelle)

A PRELIMINARY PROCEDURE FOR THE DETERMINATION OF CADMIUM IN BLOOD,
Department of Employment, London (England). Medical Services Div.
A. A. Cernik.
Atomic Absorption Newsletter, Vol 12, No 6, p 163-164, November/December 1973. 3 fig, 1 tab, 5 ref.

Descriptors: *Cadmium, *Methodology, Oxidation, *Pollutant identification, Heavy metals, Trace elements, *Spectrophotometry.
Identifiers: *Blood, *Atomic absorption spectrophotometry, Biological samples, Delves cup method, Reproducibility.

In such a complex medium as blood, the volatility of cadmium gives rise to difficulties, since this metal has a vapor pressure of 1.0 mm at 394C which is very similar to the temperature of the burning organic matrix. In order to separate the cadmium, it is necessary, therefore, to remove the organic material completely. Using the Delves cup cadmium vaporizes 2.2 sec after insertion of the crucible into the flame. The partial oxidation obtained by hydrogen peroxide described by Delves for blood lead analyses will not suffice for resolution of the matrix from the cadmium. The method described here shows that dry oxidation can produce a clear unobstructed cadmium signal. For replicate 20-microliter samples of blood with 0.0004 microgram cadmium added, dried at 100C, followed by oxidation at 425C for 6.0 min loss of cadmium varies between 6-10 percent. Replication of signals from 20 microliters of blood found to have a concentration of 0.0005 microgram cadmium (2.5 micrograms/100 ml) gave an S.D. equals 0.189 microgram cadmium/100 ml of blood. Absolute sensitivity of the method was 23 pg Cd. If the oxidation step is standardized closely with respect to temperature and time, maximum retention of cadmium can be achieved along with complete resolution from any molecular absorption. (Mortland-Battelle)

SEPARATION OF MONOSUBSTITUTED PHENOL ISOMERS USING LIQUID CRYSTALS,
North Dakota Univ., Grand Forks. Dept. of Chemistry.
L. E. Cook, and R. C. Spangelo.
Analytical Chemistry, Vol 46, No 1, p 122-126. January 1974. 1 fig, 5 tab, 21 ref.

Descriptors: *Separation techniques, *Pollutant identification, *Gas chromatography, Methodology, Chemical reactions, Phenols, Time, Chemical analysis.
Identifiers: *Liquid crystals, *Monosubstituted phenols, *Isomeric phenols, Derivatization, Phenyl n-alkyl ethers, Aromatic hydrocarbons, Isomers, Flame ionization gas chromatography, Thermal conductivity gas chromatography, 2-Methylphenol, 3-Methylphenol, 4-Methylphenol, o-Methylphenol, m-Methylphenol, o-Methoxyphenol, m-Methoxyphenol, o-Chlorophenol, m-Chlorophenol.

The separation of several isomeric monosubstituted phenols by gas chromatographic means using liquid crystal stationary phases has been studied. The method described herein utilizes both a derivatization technique, to improve peak symmetry and a liquid crystal stationary phase to increase resolution. The method of preparation of derivatives is simple, fast, and uses only reagents commonly found in the laboratory. The method is amenable to flame ionization and thermal conductivity detectors. While the separation of the isomeric phenols was partially successful, complete separation of the isomers was obtained when the phenols were converted to substituted phenyl n-

alkyl ethers. Separation factors for the meta- and para-substituted ether isomers ranged from 1.06 to 1.25. The effect of increasing the length of the n-alkyl chain was studied and found to increase the separation factor as the chain length increased. The polarity and the molecular shape of the solutes were major factors in determining the separation of the isomers. Converting the phenol to an ether and running the GC analysis required only 1-1/2 hours. (Holoman-Battelle)

DETERMINATION OF CACODYLIC ACID (HYDROXYDIMETHYLARSINE OXIDE) BY GAS CHROMATOGRAPHY,
California Univ., Davis. Dept. of Environmental Toxicology.
C. J. Soderquist, D. G. Crosby, and J. B. Bowers.
Analytical Chemistry, Vol 46, No 1, p 155-157, January 1974. 2 fig, 1 tab, 18 ref.

Descriptors: *Arsenicals(Pesticides), *Pollutant identification, *Soil analysis, *Water analysis, Methodology, Herbicides, Chemical analysis, Chemical reactions, Hydrogen ion concentration, Time, Selectivity, *Gas chromatography.
Identifiers: Electron capture gas chromatography, *Cacodylic acid, Detection limits, Chemical recovery, Derivatization, Gas liquid chromatography, Sample preparation, Distilled water, Iododimethylarsine, Hydroxydimethylarsine oxide, Methanearsonic acid, Retention time.

The conversion of cacodylic acid to iododimethylarsine with hydriodic acid, followed by a determination with electron-capture gas chromatography constitute the method whereby cacodylic acid and its salts can be determined rapidly with detection limits below 0.05 ppm in water and 0.5 ppm in soil. Those parameters that would possibly affect the analytical recovery of cacodylic acid were examined. (1) Recoveries were independent of sample pH and proved the method to be selective. (2) Reaction with hydriodic acid was complete and quantitative within 15 seconds provided that less than 20 microliters of sample water remained per 100 microliter of added hydriodic acid. (3) Iododimethylarsine solutions in organic solvent at ng/microliter levels exhibited decomposition within 30 min. Major advantages include simplicity and rapid analysis; dried soil samples can be weighed, derivatized, and analyzed in less than 10 minutes, and water samples, once evaporated, require a similar amount of time. The instability of iododimethylarsine was circumvented by using a standard curve based on fortification, and by analyzing each sample in triplicate. (Holoman-Battelle)

DETERMINATION OF CYANIDE IN ITS PLATINUM AND PALLADIUM COMPLEXES,
IBM Watson Research Center, Yorktown Heights, N.Y.
B. L. Gilbert, B. L. Olson, and W. Reuter.
Analytical Chemistry, Vol 46, No 1, p 170-171, January 1974. 1 tab, 16 ref.

Descriptors: Methodology, *Pollutant identification, Chemical analysis, Ammonia, Chemical reactions, Pollutants, Heavy metals, Analytical techniques.
Identifiers: *Cyanides, *Platinum, *Palladium, *Metal complexes, Chemical recovery, Chemical interference, Accuracy, Absorbance, Metal cyanides, Stability constants, Ammonium.

An analytical procedure is presented for the quantitative determination of cyanide in the presence of strongly complexing metal ions and large concentrations of ammonium ion. Decomposition of the sample is accomplished in a flow of hydrogen at an elevated temperature. The accuracy of this method was tested with K2Pt(CN)4.3H2O; its stoichiometry was verified by Pt and K analyses. Ten CN analyses were made on samples in the range from 65 to 1200 micrograms using the hydrogen reduction technique. Recoveries of 99 plus or minus 4 percent (STD) were obtained. NH3 precent in excess of 50 micrograms/ml in the final test solution decreases the absorbance of the CN color complex. Nine separate determinations of 43 micrograms of CN in the presence of a 100-fold excess of Pd and NH3 gave an average recovery of 101 plus or minus 5 percent (STD). Similar to NH3, bromide was found to quench the color complex when present in excess of 2 micrograms/ml in the final test solution. (Holoman-Battelle)
W74-05449

DETERMINATION OF POTASSIUM BY MEANS OF THE COTLOVE CHLORIDOMETER,
Wagner Coll. Science Center, Staten Island, N.Y. Dept. of Chemistry.
W. P. Ferren, and J. A. Cucco.
Analytical Chemistry, Vol 46, No 1, p 174-176, January 1974. 2 tab, 21 ref.

Descriptors: *Potassium, *Aqueous solutions, *Gravimetric analysis, *Pollutant identification, Alkali metals, Instrumentation, Laboratory equipment.
Identifiers: *Chloridometer, Coulometry, Potassium nitrate.

A coulometric procedure is described for determination of potassium using the Cotlove chloridometer. In the procedure reported here aqueous potassium nitrate solutions were used. A modified standard chloridometer titration solution was used. 1.8 grams of polyvinyl alchohol were dissolved in 100 ml of hot distilled water and cooled to room temperature. The potassium chloridometer titration solution was prepared by adding 6.4 ml of concentrated nitric acid to 700 ml of distilled water, with good agitation, and subsequently adding 100 ml of glacial acetic acid, 100 ml of the polyvinyl alcohol solution, and finally 100 ml of ethyl alcohol. Acid 'blanks' were coulometrically titrated by the generation of silver ions at the chloridometer HIGH setting. The above procedure was repeated except this time 0.1 ml of 0.2 M sodium tetraphenylboron solution plus 0.1 ml of 0.1 M potassium nitrate solution was added to an empty chloridometer vial and 2 minute reaction time was allowed before adding the 4 ml of acid reagent. The difference between the digital readout in the two series represents the potassium content of the second system. (Mortland-Battelle)
W74-05450

NOVEL METHOD FOR SAMPLING OIL SPILLS AND FOR MEASURING INFRARED SPECTRA OF OIL SAMPLES,
Rhode Island Univ., Kingston. Dept. of Chemistry.
C. W. Brown, P. F. Lynch, and M. Ahmadjian.
Analytical Chemistry, Vol 46, No 1, p 183-184, January 1974. 3 fig, 1 ref.

Descriptors: *Oil spills, *Sampling, Methodology, Separation techniques, *Pollutant identification, *Spectrophotometry.
Identifiers: *Infrared spectra, *Oil fingerprinting, Oil characterization, Infrared spectrophotometry.

A method is described for measuring infrared spectra of oil, which also separates water from the samples. Samples are collected by dipping Al foil into water containing the oil or by smearing the oil on Al foil. The oil adheres to the foil, whereas the water is repelled and will eventually drain off. In this way, most of the water is eliminated from the samples. The foil also serves as an excellent 'sample cell' for oil samples. To eliminate the need for removing the oil from the foil after the water drains off, the spectrum can be measured by replacing one of the plane (flat) mirrors in the sample optical path with the Al foil. All of the spectra were recorded on a Perkin-Elmer Model 521 infrared spectrometer. To obtain a spectrum of an oil sample on Al foil, the foil is placed on the backing plate with its shiny surface toward the light beam - i.e., the foil is used as a reflector surface replacing mirror M2. All mirrors including the Al plate (at M2) are adjusted in the prescribed manner to give a maximum transmitted signal at 2000/cm (a frequency at which the oil does not absorb), and a spectrum is recorded in the usual manner. (Mortland-Battelle)
W74-05451

THE DETERMINATION OF A STABILITY CONSTANT FOR THE AQUEOUS COMPLEX ZN(OH)2 USING ANODIC STRIPPING VOLTAMMETRY,
Johns Hopkins Univ., Baltimore, Md. Chesapeake Bay Inst.
W. L. Bradford.
Limnology and Oceanography, Vol 18, No 5, p 757-762, September 1973. 1 fig, 3 tab, 19 ref.

Descriptors: *Zinc, Mathematical studies, Anions, Sodium chloride, Aqueous solutions, Electrodes, Hydrogen ion concentration, Methodology, *Heavy metals, *Volumetric analysis.
Identifiers: *Stability constants, *Anodic stripping voltammetry, Stripping current, Zinc hydroxide, Ion selective electrodes, Metal complexes.

The shift in the potential of the zinc stripping current maximum observed in anodic stripping voltammetry is related to the free energy of the reaction between ionic zinc and a complexing anion. The model was tested using the zinc hydroxyl system; the agreement with experimental results was excellent. The findings suggest the existence of the aqueous complex, Zn(OH)2, which has been reported only once before. The stability constant calculated here is in good agreement with the single published value. As an experimental technique, this has the advantages of avoiding dependence on a solid phase and of making measurements at concentrations similar to those in natural waters. It could be valuable in the study of zinc, cadmium, and lead complexes. The technique can thus be applied only to those complexes whose formation rates are both very fast and faster than those of different order complexes occurring in the test solution. Descriptors: *Phenols, *Pollutant identification, *Color reactions, Chemical analysis, Organic compounds, Chemical reactions, Ammonia, Color, *Chromatography.
Identifiers: *Thin layer chromatography, *Chromogenic reagents, *Paper chromatography, 2-Aminoethyl diphenylboric acid ester, Aromatic hydrocarbons, Anthocyanidins, Flavonols,

Flavones, Glycoflavones, Hydroxycinnamic acid, Methoxycinnamic acid, Diazotized p-nitroaniline, Aluminum chloride, Sodium carbonate.

2-Aminoethyl diphenylboric acid ester (AEDBE) has been found to be quite useful in the detection of phenolic compounds being analyzed by thin-layer and paper chromatography. Both AEDBE and 5 percent AlCl3, can be used to differentiate certain phenolics (anthocyanidins). Diazotized p-nitroaniline (DPN), which has been largely used to characterize phenolic acids, is also useful spray reagent to separate some of the common flavonols. AEDBE is extremely useful to differentiate some of the common phenolic compounds belonging to the anthocyanidin, flavonol, flavone and hydroxycinnamic acid groups. (Holoman-Battelle)

Identifiers: Sample preparation, Chemical interference, *Photooxidation, CONCAWE's method, Organic solvents, Kerosene, Accuracy, Chromatograms, Aromatic hydrocarbons.

To accurately measure the amount of oil in water, it is necessary to separate non-hydrocarbons from hydrocarbon material in the samples. Several points were studied toward the development of a satisfactory separation procedure: the formation of oxidation products of mineral oil components in water; the extraction of such oxidation products along with the hydrocarbons and the effect of the solvent (n-pentane, benzene, chloroform or carbon tetrachloride) on the extraction; and the removal of the polar or polarizable products from an extract by means of adsorption on Florisil. Samples were analyzed by gas chromatography. The following was concluded from the studies: (1) All current solvents extract the same amount of hydrocarbon compounds from a (waste) water sample. n-Pentane extracts the smallest amount of oxidation products (non-hydrocarbons). (2) Florisil properly removes the relevant non-hydrocarbons from an n-pentane extract. A disadvantage of this solvent is that some 10-25 percent of the aromatic hydrocarbons are also removed. (3) Solvents that are more polar than n-pentane extract more non-hydrocarbon material from a water sample and are less susceptible to a treatment with Florisil. (4) A suitable procedure is to shake 10 ml n-pentane extract with 1 g of 30/60 mesh Florisil for two or three minutes. (5) Apart from biochemical oxidation (photo)-chemical oxidation may produce far more oxidation products of mineral oil components and within a shorter period of time than is sometimes assumed. (6) For the determination of oil dissolved in (waste) water CONCAWE's method IIIB is recommended. (Little-Battelle)

THE DETERMINATION OF BORON IN SOLUTION TO SUB-P.P.B. CONCENTRATIONS BY HOLLOW-CATHODE EMISSION,
Virginia Univ., Charlottesville. Dept. of Chemistry.
E. H. Daughtrey, and W. W. Harrison.
Analytica Chimica Acta, Vol 67, No 2, p 253-258, December 1973. 4 fig, 17 ref.

Descriptors: *Boron, *Aqueous solutions, Water analysis, Trace elements, *Spectroscopy.
Identifiers: *Detection limits, *Hollow cathode emission, Emission spectroscopy.

Sub-ppb concentrations of boron in solution were determined by the use of a hollow-cathode emission source for the analysis of cathode surface film deposited from the solution. Solutions were prepared by dissolving boric acid or sodium tetraborate in distilled, deionized water. A Glomax demountable hollow-cathode lamp operating in the flow mode, was used with two modifications. A gas port modification and a replacement of the constricted flow concentric tubing (serving as both cooling water source and drain to the heat exchange block) with a Swagelok Tee-joint fitting and a short length of thin wall stainless steel tubing joined to the heat exchange block by a machine fitting. Copper proved to be an excellent cathode material, owing to low background and ease of boron sputtering from the surface. Clean-up of the cathode was a critical factor in reproducibility of hollow-cathode emission. The best signal-to-background intensity was at 0.7 torr pressure of argon, measured on the exit side of the tube. The lower limit of atomic emission detection is about 10 pg, although the sensitivity could be improved by multiple sample applications. The boron atomic line emission is 200 times as intense as boron oxide band emission. (Little-Battelle)

THE EXTRACTION-SPECTROPHOTOMETRIC DETERMINATION OF CHROMIUM (III) WITH 4-(2-PYRIDYLAZO)-RESORCINOL,
Hokkaido Univ., Sapporo (Japan). Lab. of Analytical Chemistry.
T. Yotsuyanagi, Y. Takeda, R. Yamashita, and K. Aomura.
Analytica Chimica Acta, Vol 67, No 2, p 297-306, December 1973. 8 fig, 21 ref.

Descriptors: *Separation techniques, *Chromium, *Aqueous solutions, *Spectrophotometry, Heavy metals, Water analysis, Absorption, Color, *Solvent extractions.
Identifiers: Chemical interference, Sensitivity, Sample preparation, Metal chelates, *Resorcinols.

The extraction-spectrophotometric determination of chromium (III) with 4-(2-pyridylazo)-resorcinol (PAR) is described. PAR(H2R) forms a 1:3 complex with chromium (III) in a boiling acetate buffer solution at pH 5. The complex forms an ion-association compound with tetradecyldimethylbenzylammonium ion (TDBA):Cr(R)(HR)2(minus)-TDBA which can be extracted into chloroform, the molar absorptivity being 47,000 at 540 nm. If EDTA is added as a masking agent after the Cr(HR)3 has been formed, only iron, cobalt and nickel interfere seriously, and the method can be made specific for chromium by a preliminary extraction of these metals with cupferron. The sensitivity of the method is seven times higher than that of the diphenylcarbazide method. (Little-Battelle)

THE SPECTROPHOTOMETRY AND SOLVENT-EXTRACTION BEHAVIOUR OF IRON(III), VANADIUM(IV AND V) AND TITANIUM(IV) CHELATES OF 1-(O-CARBOXYPHENYL)-3 HYDROXY-3-METHYLTRIAZENE,
Jadavpur Univ., Calcutta (India). Dept. of Chemistry.
A. K. Majumdar, B. C. Bhattacharyya, and B. C. Roy.
Analytica Chimica Acta, Vol 67, No 2, p 307-315 December 1973. 4 fig, 5 ref.

Descriptors: *Spectrophotometry, *Solvent extractions, *Iron, *Titanium, Separation techniques, Cations, Anions, Heavy metals, Aqueous solutions, Water analysis.
Identifiers: *Metal chelates, *Vanadium, Chloroform, Sulfuric acid, Tartaric acid, Chemical interference.

1-(o-Carboxyphenyl)-3-hydroxy-3-methyltriazene is proposed as an excellent reagent for the spectrophotometric determination of iron(III) and titanium(IV), and also for the separation of titanium from a large quantity of iron as well as other cations and anions. Iron(III) forms an anionic violet 1:2 complex at pH 4.0-9.4, and a cationic green 1:1 complex at pH 1.5-2.0, with absorption maxima at 570 nm and 660 nm, respectively. The violet complex is quantitatively extracted in chloroform containing n-octylamine at pH 3.0-9.0. The green and the violet iron(III) complexes obey Beer's law, the respective optimal ranges between 8.9-35.8 and 3.9-11.2 ppm. The yellow titanium chelate extracted into chloroform (absorption maximum at 410 nm) between pH 1.0 and 3.5, can be reextracted into concentrated sulphuric acid and a violet color being produced with absorption maximum at 530 nm. Beer's law is obeyed in the ranges 0.8-5.7 ppm for the titanium complex in chloroform and 3.4-19.2 ppm when extracted in concentrated sulphuric acid. Interferences from diverse ions are not severe. Procedures for the separation and determination of titanium in the presence of a large quantity of iron are given. The isolation of the iron(III) and vanadium(IV and V) complexes, and their properties, are described. (Mortland-Battelle)

SYNERGIC SOLVENT EXTRACTION OF DIVALENT CATIONS WITH DECAFLUOROHEPTANEDIONE AND DI-N-BUTYLSULFOXIDE,
Hewlett-Packard Co., Avondale, Pa. Avondale Div.
C. A. Burgett.
Analytica Chimica Acta, Vol 67, No 2, p 325-330 December 1973. 3 fig, 1 tab, 11 ref.

Descriptors: *Solvent extractions, *Iron, *Cobalt, *Nickel, *Lead, Copper, Hydrogen ion concentration, Stability, Cations, Separation techniques, *Volumetric analysis, Heavy metals, Aqueous solutions, Water analysis, Efficiencies.
Identifiers: Equilibration time, Stoichiometry, Chemical interference.

The synergic solvent extaction of iron(II), cobalt(II), nickel(II) and lead(II) with 1,1,1,2,2,6,6,7,7,7-decafluoro-3,5-heptanedione (H(FHD)) and di-n-butylsulfoxide (DBSO) into cyclohexane is described. The optimal pH, equilibration time, stoichiometry and stability of the extracted species were studied. Approximately 0.01 M solutions of the cations were prepared by dissolving the appropriate salt in deionized water. The stock solutions were then standardized by titration with EDTA, NAS serving as the indicator. Exactly 1.00 ml of the 0.01 M metal solutions was pipeted into a 15-ml screw-cap glass test tube. Then 1.00 ml of the appropriate buffer solution was added to each test tube. To each test tube 1.00 ml of a cyclohexane solution of DBSO and 1.00 ml of a cyclohexane solution of H(FHD) was added. The mixture was shaken for 1 h and the phases were allowed to separate. The equilibrium pH of the aqueous phase was measured. A 1.00-ml aliquot of the aqueous phase was removed for determination of the amount of unextracted metal

/ titration with EDTA as described above. For all the metals studied, highly efficient extraction curred at equilibrium pH values of 4.5-6.0. No trimental effect from the presence of chloride, etate, sodium or acetic acid was observed. The traction was found to be quantitative after uilibration times of 15 min or more. All of the tracted species, except the iron(II) complex, ere stable for a period of two weeks and could be ried at 100C. The iron(II) complex was stable ter one day at low pH, but at pH 6.0 the complex as stable for one week. (Mortland-Battelle)

NEUTRON IRRADIATION OF MERCURY IN POLYETHYLENE CONTAINERS,
Naval Undersea Center, San Diego, Calif.
H. V. Weiss, and K. Chew.
Analytical Chimica Acta, Vol 67, No 2, p 444-447, December 1973. 2 tab, 3 ref.

Descriptors: *Mercury, *Irradiation, *Acidity, *Plastics, Adsorption, Neutron activation analysis, Aqueous solutions, Chemical analysis, Time, Heavy metals, *Radioactivity, Trace elements.
Identifiers: Chemical loss, Volatilization, Hg-197, Data interpretation, Cd-115-In-115.

When mercury is neutron-irradiated in polyethylene containers, its behavior is dependent on acidity of the solution. Mercury was irradiated for 10 and 60 min in solutions of different nitric acid concentration. For each of the time periods, the unacidified solutions contained less Hg-197 than their acidified counterparts; this difference was more pronounced for the 60-min irradiated samples. Comparison of activity levels for solutions irradiated for the two time intervals indicate the counting rates scale by a factor of six for the acidified solutions but not for water. Counting data are given for irradiation vials directly counted several days after neutron activation of cadmium and mercury solutions of varying acidity. With cadmium the counting rate decreased regularly as a function of nitric acid concentration, while with mercury the activity level in the unacidified sample was substantially less than for the samples in nitric acid solution. The relationship between the comparable ntric acid solutions of mercury parallels that of cadmium. From these results the conclusion is drawn that mercury in acidified solution is not lost during irradiation, at least not over the interval 10-60 min. But in the absence of acid, substantial loss is encountered. The loss appears to occur by two routes: adsorption and volatilization. (Holoman-Battelle)
W74-05476

A SIMULTANEOUS DETERMINATION OF ZINC AND CADMIUM,
Gustavus Adolphus Coll., St. Peter, Minn. Dept. of Chemistry.
R. E. Jensen, and M. Kaehler.
Analytica Chimica Acta, Vol 67, No 2, p 465-468, December 1973. 1 tab, 2 ref.

Descriptors: *Zinc, *Cadmium, *Aqueous solutions, Methodology, *Chemical analysis, *Pollutant identification, Stability, Trace elements, Cations, Heavy metals, Chelation, Solvent extractions, *Spectrophotometry.
Identifiers: Picolinealdehyde-2-quinolylhydrazone, *Atomic absorption spectrophotometry, Metal complexes, Extraction efficiency, Sensitivity, Detection limits, Ionic interference, Complexation.

This particular method for the simultaneous determination of zinc and cadmium involves using picolinealdehyde-2-quinolylhydrazone (PAQH) as the complexing agent, extracting from aqueous solution into chloroform, and completing the measurement by atomic absorption spectrophotometry. The most efficient complexation and extraction were obtained at pH 8.5. A study of excess of reagent on the zinc(II)-PAQH system showed that a fifteen-fold excess of ligand was sufficient for maximal complex formation. A twenty-fold excess of PAQH was necessary for maximal cadmium(II)-PAQH complex formation. Three 5-ml aliquots provided the greatest extraction efficiency. Solutions of both complexes were stable for a least one week. The Zn(II)-PAQH complex was found to obey Beer's law over a concentration range of 0.065-1.30 ppm. The sensitivity of measurement was calculated as 17.7 ppb, and the detection limit 3.13 ppb. A similar study of the Zn(II) complex absorbance over the same concentration range in aqueous solution gave the comparable sensitivity and detection limit as 27.8 ppb and 9.34 ppb, respectively. The Cd(II)-PAQH complex obeyed Beer's law over the same concentration range 0.113-2.26 ppm Cd(II). The sensitivity level was determined as 22.6 ppb, and the detection limit was 1.7 ppb. In comparable aqueous solutions, the sensitivity was 60.3 ppb, and the detection limit 10.5 ppb. Although it has been shown that there is no mutual interference between the zinc and cadmium complex systems, there are interferences from other cations. These interfering ions consume the reagent and must be removed before the analysis for zinc and cadmium. (Holoman-Battelle)

PHOTOMETRIC DETERMINATION OF DIPHENYLAMINE WITH CERIUM(IV) SULPHATE,
Andhra Univ., Waltair (India). Dept. of Chemistry.
M. Gandikota, and G. G. Rao.
Analytica Chimica Acta, Vol 67, No 2, p 469-472, December 1973. 1 fig, 2 tab, 10 ref.

Descriptors: *Pollutant identification, *Chemical analysis, *Spectrophotometry, Stability, Photometry, Pollutants, Methodology, Color reactions, Oxidation.
Identifiers: *Cerium sulfate, *Diphenylamine, Accuracy, Chemical interference, Aniline, Methanol, Ethanol, Sulfuric acid, Chemical concentration.

The conditions are established for the quantitative oxidation of diphenylamine with cerium(IV) sulfate to diphenylamine blue and its photometric determination. The results obtained from studying the effect of Cs(IV) concentration showed that with molar ratios of diphenylamine to Ce(IV) varying from 1:2.5 to 1:8 the diphenylamine blue is not destroyed even by a large excess of the oxidant over and above that required for the formation of the blue color. The stability of the blue color increases with increasing concentration of sulphuric acid, being about 5-6 min in 4M sulphuric acid, about 6-7 min in 5M sulphuric acid and about 9-10 min in 6M sulphuric acid. Compared with the available procedures this has the advantages of speed, fewer reagents and freedom from interference from aniline (0.08 nmoles), methanol (59 moles), and ethanol (17 nmoles). (Holoman-Battelle)

ANIONIC ELECTROPHORETIC PATTERN OF FIVE RUTHENIUM SALTS IN FRESH AND SEA WATER: EFFECTS OF AGING AND DILUTION,
Centre d'Etude de l'Energie Nucleaire, Mol (Belgium). Laboratoires.
J. Vos, S. Van Puymbroeck, and O. Van Der Borght.
Analytica Chimica Acta, Vol 67, No 2, p 480-485, December 1973. 2 fig, 16 ref.

Descriptors: *Waste dilution, Freshwater, Sea water, *Aging(Physical), Aqueous solutions, *Chemical analysis, *Salts, *Nuclear wastes, *Electrophoresis, Water analysis, Heavy metals, Methodology.
Identifiers: *Anionic electrophoresis, *Ruthenium salts, Dilution, Ruthenium nitrosylhydroxynitrite, Ruthenium nitrosylchloride, Ruthenium chloride, Ruthenium nitrosylhydroxide, Ruthenium nitrosylnitrate, Ru-106.

The presence of ruthenium species in the wastes of nuclear fuel reprocessing plants has led to considerable interest in the very complex behavior of ruthenium. In this study, five ruthenium salts (nitrosylhydroxynitrite, nitrosylchloride, chloride, nitrosylnitrate complexes, and nitrosylhydroxide) were studied for influence of dilution and aging, by means of high-voltage electrophoresis: (1) in concentrated aqueous solutions; (2) after further dilution with freshwater; and (3) after further dilution with seawater. This study provides further evidence of the complexity of ruthenium in aqueous neutral solutions and emphasizes the following

points, which are important for waste release management. (1) The behavior of the ruthenium salts is, in general, similar in filtered seawater and freshwater, except for fresh nitrosylnitrate solutions. (2) Aging is still incomplete after one week except for the ruthenium-nitrosylchloride complexes where there are no such effects. (3) Aging of the ruthenium solutions results generally in a decrease of the number of complexes, a decrease of their mobility and a severe decrease or total disappearance of the resolution of the separation pattern. (4) Ten-fold dilution had no important influence except for the fresh ruthenium chloride and the 7-day old nitrosylnitrate. (5) Nitrosylnitrite, and especially the aged solutions, contains an exceptionally low amount of Ru-106 adsorbed on the staring line. (6) The characteristics of nitrosylhydroxide solutions in fresh and seawater, are similar to the other salts. The freshly prepared solutions contain about 30 percent of negative complexes with comparatively high mobility in the electric field. (7) The number of species detected by high-voltage electrophoresis in phosphate buffer ranges up to 13 clearly defined bands and 2 vaguer tailings for freshly prepared concentrated neutral ruthenium-chloride complexes. Each salt gives a different electrophoretic separation picture, although complexes at 20-20.5 cm from the starting line appear in most solutions. (Holoman-Battelle)

GAS CHROMATOGRAPHY OF SUBSTITUTED PHENYLUREAS BY FLASH-HEATER METHYLATION WITH TRIMETHYLANILINIUM HYDROXIDE,
Agricultural Research Service, Fargo, N. Dak.
F. S. Tanaka, and R. G. Wien.
Journal of Chromatography, Vol 87, No 1, p 85-93, December 5, 1973. 2 fig, 3 tab, 11 ref.

Descriptors: *Herbicides, *Aromatic compounds, Monuron, *Urea pesticides, *Gas chromatography, Pollutant identification.
Identifiers: *Phenylureas, Gas liquid chromatography, *Methylation(Flash heater), Diuron, Fluometuron, Fenuron, Linuron, Metabromuron, Neburon, Methelutes.

A simple method for the methylation of substituted phenylureas with trimethylanilinium hydroxide (methelute) is described. The methylation reaction product was the 3-N-methyl analog of the substituted phenylurea. Seven phenylureas (fluometuron, fenuron, monuron, metobromuron, linuron, diuron, and neburon) with a variety of structures were analyzed using six different chromatographic columns. The gas chromatographic response was linear with increased concentration of the 3-N-methyl analogs of monuron and diuron for both synthetic standards and flash-heater reaction products. Maximum methylation was obtained when the ratio of methylating reagent to phenylurea was approximately 2.5:1. This methylation technique provides for rapid qualitative and quantitative chromatography of substituted phenylureas without side-chain decomposition. (Mortland-Battelle)

PERHALOBENZENESULFINATES AS REAGENTS IN THE DETERMINATION OF INORGANIC MERCURY IN VARIOUS MEDIA BY GAS-LIQUID CHROMATOGRAPHY,
North Carolina Univ., Chapel Hill. School of Medicine.
P. Mushak, F. E. Tibbetts, III, P. Zarnegar, and G. B. Fisher.
Journal of Chromatography, Vol 87, No 1, p 215-226, December 5, 1973. 6 fig, 1 tab, 12 ref.

Descriptors: *Mercury, Aqueous solutions, Urine, *Gas chromatography, Water analysis, Heavy metals, *Pollutant identification.
Identifiers: Gas liquid chromatography, *Biological samples, Serum, Perhalophenyl mercury, Arylating agents, Aryl mercurials, *Organomercury compounds, Electron capture detector, Detection limits, Precision, Chemical Recovery.

Inorganic mercury and organomercurials present in water, urine and serum are evaluated by gas-liquid chromatography and the use of perhalobenzenesulfinates which react with inorganic mercury to yield a perhalophenyl mercury. Best results are obtained with lithium pentafluorobenzenesulfinate as arylating agent for inorganic mercury. Recovery and precision data include: water, 70.5 percent (6.8); urine, 81.4 (10.5); serum, 51.0 (9.4). Lower detection limit of inorganic mercury, as the pentafluorophenyl analyte, is 20 ng of meliliter of sample. Optimal chromatographic results were obtained with 10 percent Dexsil-300 on Anakrom SD, 70-80 mesh, and Durapak Carbowax 400 on Porasil F. (Mortland-Battelle)

METAL COORDINATION COMPOUNDS OF THIABENDAZOLE,
Western Washington Research and Extension Center, Puyallup.
V. L. Miller, C. J. Gould, E. Csonka, and R. L. Jensen.
Journal of Agricultural and Food Chemistry, Vol 21, No 5, p 931-932, September/October 1973. 1 tab, 12 ref.

Descriptors: *Fungicides, *Aqueous solutions, Copper, Zinc, Cobalt, Nickel, Solubility, Synthesis, Biological properties, Bioassay, Fungi, Hydrogen ion concentration, Water quality, Spectroscopy, Pesticide toxicity, *Metals.
Identifiers: *Thiabendazole, Fusarium, Penicillium, 2-(4'-Thiazolyl)benzimidazole, Organometallics.

Several metal coordination compounds of the fungicide thiabendazole, 2-(4'-thiazolyl)benzimidazole (TBZ), were prepared and the solubilities in water and the pH of the solutions were determined. Fungicidal activity of the compounds was equal to that of TBZ against an isolate of Penicillium and of Fusarium. For analysis the compounds were hydrolyzed in 6 N HCl at steam bath temperature for 1-2 hr. TBZ was determined by absorbance of an aliquot of the digest in 0.1 N HCl measured at 302 nm. For chloride analysis, the sample was dissolved in dilute nitric acid and titrated. The approximate water solubility of the compounds was determined by machine shaking of excess compound with water at room tempe at least 4 hr. The water solubility of TBZ was determined to be 1-2 micrograms/ml. The ZN (TBZ)2C14 and CoTBZ(GLU)2 were the most soluble. The solubility of TBZHCl as TBZ was 18.2 mg/ml, and the pH was 3.3. The materials to be bioassayed were dissolved in water and the concentration was determined by spectroscopy at 302 nm in 0.1 N HCl. The control level of active ingredient of commercially formulated TBZ determined by this bioassay was 11 micrograms/ml for Penicillium and 92 micrograms/ml for Fusarium. The activity of the synthetic materials may reflect water solubility rather than greater potency. (Mortland-Battelle)

Identifiers: *Manganese oxide, Scavengi Transport, Ionic strength, Desorption Pollut Removal.

The adsorption of Hg(II) by hydrous mangan oxides suspended in solutions with wide ranges pH, chloride concentration, and ionic strength w studied to evaluate the possible importance manganese oxides in mercury scavenging in na ral waters. Manganese dioxide and possibly otl oxides were precipitated with the addition MnS04 solution to KMn04 solution. Hg(II) was sorbed rapidly when added to aged suspensions Mn02 with low ionic strength. 0.6 M Na repressed adsorption below pH 9, but not abo pH 10. Apparently 0.6 M NaC104 chang equilibrium values only slightly, but adsorpti rates were many ornitude lower, particula above pH 8. It is concluded that Mn02 may be i portant as a mercury scavenger in fresh brackish water, either in the natural environm or in the treatment of water and wastewater. C clusions about Hg in manganese nodules in ocean are not justified because of the large trapolation required between the data present and the actual ocean concentrations of Hg(II). the other hand, in freshwater lakes and strean and possibly in soils, amorphous manganese ides would be active scavengers of mercury. T actual presence of mercury in manganese nodu from deep ocean deposits may be accounted for other mechanisms not studied in this wo (Mortland-Battelle)

GAS-LIQUID CHROMATOGRAPHIC DETERMINATION OF ROTENONE AND DEGUELIN IN PLANT EXTRACTS AND COMMERCIAL INSECTICIDES,
Northern Regional Research Lab., Ill.
N. E. Delfel.
Journal of the Association of Official Analytical Chemists, Vol 56, No 6, p 1343-1349, November 1973. 2 fig, 3 tab, 16 ref.

Descriptors: *Insecticides, Vegetation, Leaves, Separation techniques, Gravimetric analysis, *Gas chromatography, *Pollutant identification.
Identifiers: Gas liquid chromatography, *Rotenone, *Deguelin, Flame ionization detector, Derris elliptica, Rotenolone, Lonchocarpus nicou, Tephrosia, vogelii, Thin layer densitometry, Reproducibility.

Retention times on 3 percent methyl silicone in glass columns at 160C were 0.85 and 1.39, respectively, for deguelin and stigmasterol acetate, the internal standard; and flame ionization detector responses were 1.00 and 1.47, respectively, compared to rotenone as 1.00 in both cases. Rotenolone, when present, interfered with the determination of deguelin. Rotenoid extracts from Derris elliptica and Lonchocarpus nicou roots lacked other interfering materials. Tephrosia vogelii leaflets contained fat-soluble contaminants that were minimized by using acetonitrile for extraction and by subsequent partitioning with hexane. When the GLC assay was applied to commercial samples, rotenone results were comparable to label values in 2 samples and rotenoid oxidation products were detected in 2 others. The precision of GLC was plus or minus 4.1 percent and the results agreed with those by thin layer densitometry (TLD) within 2.1 percent for rotenone and 2.9 percent for deguelin. A monor improvement of TLD for analysis of T. vogelii extracts is also described. In conclusion, GLC is quicker than TLD and yields more reproducible results (4 percent vs. 8 percent, respectively). The 2 methods gave comparable results on D. elliptica and L. nicou, and GLC avoided most of the bias for the TLD deguelin value in T. vogelihe GLC method has many positive attributes which favor its being considered as an alternative to the slower, more expensive gravimetric method for rotenone in industrial quality control. (Mortland-Battelle)

Journal of the Association of Official Analytical Chemists, Vol 56, No 6, p 1506-1507, November 1973. 5 fig, 6 ref.

Descriptors: *Insecticides, *Automation, *Gas chromatography, *Methodology, Adsorption, Flow, *Pollutant identification, Organophosphorus pesticides.
Identifiers: *Anticholinesterases, AutoAnalyzer, Chlorfenvinphos, Cholinesterase, Sensitivity, Reproducibility.

Problems of adsorption of relatively nonpolar anticholinesterase insecticides to the pump tubing of automated flow systems have been noted and described by several authors. The problem has now been eliminated by not pumping the sample solutions directly; instead they are more concentrated and are manually injected into a special flowcell-type injection chamber just downstream from the proportioning pump. In the original procedure the insecticide solution (0.8 ml/min) was pumped from the sampler (20 samples/hr, 1 min sample aspiration followed by a wash period of 2 min) and mixed with an equal volume of buffered cholinesterase solution. The altered portion of the manifold, however, in addition to the usual air pump tubing, requires only one pump tube (1.6 ml/min) through which the enzyme working solution (2-fold dilution) flows into an all-glass and one-piece injection cell with a volume of ca 0.8-1.0 ml. The solution passing through the cell is continuously stirred by means of a magnetic flea. Methanolic insecticide solutions are then injected into the cell through a silicone rubber sng a microsyringe. Original AutoAnalyzer recordings obtained with the organophosphate chlorfenvinphos and peacock plasma cholinesterase are presented for both systems. The results demonstrate the advantages of injecting nonpolar compounds into an aqueous flow system. While the injections are performed manually in the present system, the potential for full automation awaits the inclusion of an automated injection sampler, for example, the Hewlett-Packard Model 7670A automatic sampler. ULTRASONIC SOLUBILIZATION TECHNIQUE FOR USE IN COULOMETRY,
Wagner Coll. Science Center, Staten Island, N.Y.
W. P. Ferren, and W. M. Fortinash.
Journal of the Association of Official Analytical Chemists, Vol 56, No 6, p 1514-1515, November 1973. 1 tab, 4 ref.

Descriptors: *Chlorides, *Analytical techniques, *Pesticides, Organic compounds, Methodology.
Identifiers: *Coulometry, *Ultrasonic solubilization, Precision, p-Chlorobenzoic acid.

An ultrasonic solubilization technique has been developed which is useful as a first step in the coulometric determination of the chloride content of crystalline organic compounds such as p-chlorobenzoic acid. p-Chlorobenzoic acid was used as the test compound because it represents a crystalline powder substance requiring very efficient agitation to achieve the necessary intimate contact with the sodium biphenyl reagent. Using p-chlorobenzoic acid as the standard, it was found that adding hydrogen peroxide and evaporating by heat yielded errors as much as -10 percent. The use of ceric ion to destroy hydrogen peroxide prior to coulometric measurements reduced these errors to about -3 percent. Subsequently, the elimination of hydrogen peroxide in favor of a stream of oxygen gas improved the accuracy of the method to the point where the average value of 10 determinations was 22.58 percent chloride compared to the theoretical value of 22.65 percent cride. It was possible to determine 4 micrograms chloride (as present in p-chlorobenzoic acid) with a linear relationship between read-out and chloride content for p-chlorobenzoic acid in the sample range 0.0 to 2.0 mg. The percentage of chloride in p-chlorobenzoic acid was determined with an absolute error of -0.07 percent or a relative error of -0.3 percent. The standard deviation was 0.06, which yields a 95 percent confidence interval of plus or minus 0.04 percent. This confidence interval applies within the limits of detection. (Mortland-Battelle)

EXPERIMENTAL APPROACHES TO LIMNOLOGY - AN OVERVIEW,
Fisheries Research Board of Canada, Winnipeg (Manitoba). Freshwater Inst.
D. W. Schindler.
Journal of the Fisheries Research Board of Canada, Vol 30, No 10, p 1490-1413, October 1973. 1 tab, 26 ref.

Descriptors: *Limnology, *Lakes, *Nutrients, *Methodology, Eutrophication, Carbon, Gas chromatography, Diffusion, Radioactivity techniques, Primary productivity, Bioassay, Model studies, Bicarbonates, Water temperature, Hydrogen ion concentration, Water quality, Volumetric analysis, Plankton, Algae, Chlorophyll, Phosphates, Fertilization, Phosphorus, Carbon, Absorption.
Identifiers: Dissolved inorganic carbon, ATP, Experimental Lakes.

After 4 years of searching for methods to describe and interpret changes in lakes of the Experimental Lakes Area and considerable laboratory work related to critical problems in freshwater nutrient dynamics, several papers describing the work have been prepared. This paper attempts to summarize these individual contributions. One problem encountered was lack of a reliable method for measuring dissolved inorganic carbon. A modified gas chromatographic technique was devised to overcome this shortcoming. A simple method for measuring live microplankton biomass was also needed. This need may be met through ATP measurements, although several possible problem areas must be thoroughly tested. A serious problem still remaining is the estimation of true phosphate concentrations. Standard acid molybdate methods give too high results in most waters and bioassay or Sephadex techniques are time-consuming and require highly experienced personnel. Several problems with various physical methods (diffusion gas exchange, dye diffusion, radon techniques) are also discussed as are those with in situ biological methods. Fallacies in systems modelling approaches to nutrient and productivity studies are pointed out. It is concluded that from a purely scientific point of view, the most important area in limnological research remains the construction and thorough testing of a sound methodology, designed to illuminate ecosystem problems rather than just to describe them. THIN-LAYER CHROMATOGRAPHY OF METAL CHELATES. PART II. AN EXTENDED THEORY AND ITS TESTING ON METAL DITHIZONATES AND METAL DIETHYLDITHIOCARBAMATES,
A. Galik.
Analytica Chimica Acta, Vol 67, No 2, p 357-376, December 1973. 12 fig, 3 tab, 25 ref.

Descriptors: *Aqueous solutions, *Heavy metals, *Mathematical models, Mercury, Copper, Nickel, Cobalt, Lead, Cadmium, Zinc, Iron, Humidity, Temperature, Water analysis, Solvents, Methodology, Equations, *Chromatography.
Identifiers: *Metal Chelates, *Organic solvents, *Thin layer chromatography, Bismuth, Indium, Antimony, Dithizonates, Diethyldithiocarbamates, Sample preparation, Validity.

The extension of an earlier mathematical model attempted to explain the effect of solvent composition a humidity on the thin-layer chromatographic (tlc) behavior of metal pyridylazonaphtholates. The purpose of the study was to make the model capable of predicting more phenomena and to provide a basis for further research leading to a better understanding of the chromatography of metal chelates. Review and study of the model led to the derivation of equations from which it was concluded that the position of the spot of the solute on the chromatogram may be influenced by the choice of the polar component of the solvent mixture, by the concentration of this component in this mixture, and by air humidity and temperature. The validity of these conclusions was shown by studying the tlc behavior of metal (Hg, Bi, Cu, Ni, Co, Pb, Cd, Zn, In, Sb, Fe) dithizonates and diethyldithiocarbamates on Silufol. A comparison of the mobilities of these metal chelates, as well as of those of 8-hydroxyquinoline, salicyladoxime and benzoylacetone, with their extraction constants showed a mutual correlation between these properties. (Little-Battelle)

AN IMPROVED ION-EXCHANGE TECHNIQUE FOR THE CONCENTRATION OF MANGANESE FROM SEA WATER,
Skidaway Inst. of Oceanography, Savannah, Ga.
R. G. Smith, Jr.

Skidaway Institute of Oceanography Annual Progress Report (EPA Project No R-800372), Appendix E, p 236-242, January 1974. 1 tab, 10 ref.

Descriptors: *Chemical analysis, *Manganese, *Sea water, *Ion exchange, Analytical techniques, Flame photometry, Pollutant identification.

In analysis of Mn in seawater, a batch technique is used for the concentration of Mn using Chelex-100. The technique alleviates difficulties in the column technique caused by swelling and contraction properties of the resin. The method yields quantitative recovery with a variation in efficiency of plus or minus 0.6%. (See also W74-05501) (Knapp-USGS)
W74-05506

DETERMINATION OF THE RATE OF TRIPOLY- AND PYRO-PHOSPHATE HYDROLYSIS IN SEDIMENTS,
Missouri Univ., Columbia. Dept. of Agronomy.
R. W. Blanchar, and D. Riego.
Available from National Technical Information Service as PB-229 837 $6.25 in paper copy, $1.45 in microfiche. Missouri Water Resources Center, Columbia, Completion Report, January 1974. 52 p, 18 fig, 2 tab, 34 ref. OWRR A-059-MO(1). 14-01-0001-3825.

Descriptors: *Hydrolysis, *Sediments, *Missouri, Kinetics, *Phosphates, Chemical precipitation, Chemical reactions, Pollutant identification.
Identifiers: *Polyphosphates, *Pyrophosphates.

The rate of hydrolysis of tripolyphosphate (TPP) and pyrophosphate (PP) in sediments was determined. The sediments were collected from Cape Fair, Thomas Hill Lake, Flat Branch Creek, and Maries River. The rate of hydrolysis of TPP and PP was similar to that predicted from first order kinetics. Half lives for the hydrolysis of TPP and PP were 1.6 to 2.6 and 6.7 to 27.4 days, respectively. The influence of temperature, biological activity, and pH on the rate of TPP and PP hydrolysis was investigated using Flat Branch Creek sediment. The rate of TPP and PP hydrolysis increased with increasing temperature. The activation energy was 5415 cal/mole for TPP and 10,412 cal/mole for PP. TPP and PP were hydroloyzed faster in non-sterile sediment than in sediment which had been sterilized. The half life for TPP hydrolysis was 1.76 days at pH 5, 1.61 days at pH 7, and 2.16 days at pH 9. PP hydrolysis was increased as pH was increased from 5 to 7 to 9 as indicated by half lives of 13.7, 10.0 and 7.3 days, respectively. When TPP was added to the sediment as a Ca5 (P3010)2 precipitate the rate of hydrolysis was slower (1/2life = 2.79 days) than when TPP was added as a solution (1/2life = 1.68 days).

DETERMINATION OF SULFATE USING FERRIC ION-SELECTIVE ELECTRODE,
R. J. Jasinski, and I. Trachtenberg.
Available from NTIS as PB-220 443, $3.00 paper copy; $1.45 microfiche. Department of the Interior, Office of the Solicitor, Patent Application Serial Number 350,444, April 1973. 9 p, 2 fig.

Descriptors: *Patents, Chemical reactions, Sea water, Industrial wastes, Brackish water, Pollution abatement, Water quality control, *Electrodes, Sulfates, Analytical techniques, *Pollutant identification, Measurement, Aqueous solutions.
Identifiers: *Sulfate ions, Ferric ions, *Sensors, *Ion selective electrodes.

Detection and measurement of the concentration of various ions in aqueous solution by means of ion selective electrodes finds utility in a variety of environmental and industrial applications. Analytical potentiometry, and ion selective electrodes or sensors therefore, can be employed for control of water quality, to obtain optimum yields in chemical processes, etc. Sulfate ion concentration in aqueous solution is determined by initially adding a known concentration of ferric ion to the solution, and adjusting the pH of the solution to a suitable value, whereby ferric ion is complexed by the sulfate ion. The activity of the remaining, uncomplexed ferric ion is then measured by means of a ferric ion-selective electrode. (Sinha - OEIS)

CHARACTERISTICS OF CONDENSER WATER DISCHARGE ON THE SEA SURFACE (CORRELATION OF FIELD OBSERVATIONS WITH THEORY),
Massachusetts Inst. of Tech., Cambridge.
S. C. Doret, D. R. F. Harleman, A. T. Ippen, and B. R. Pearce.
Available from NTIS as COM 73-11294, $4.50 in paper copy, $1.45 microfiche. Sea Grant Publication Report No. MITSG 73-12, Index No. 73-312-Ccs, June 1973. 124 p, 35 fig, 3 tab, 9 ref, 22 plates. NOAA NG-43-72.

Descriptors: Massachusetts, *Electric powerplants, *Heated water, *Nuclear powerplants, Measurement, *Thermal pollution.
Identifiers: Coastal waters, Pilgrim Nuclear Power Station(Mass), Condenser water, Sea surface, Temperature distributions, Waste heat, Plumes.

Field measurements of the condenser water discharge plume at the Pilgrim Nuclear Power Station were conducted during three survey periods between January and April 1973. Horizontal temperature profiles of the plume were obtained for two water depths. Vertical temperature profiles were obtained in the far field to establish the ambient water conditions for the various survey periods. Plume centerline temperature reduction versus distance and surface isotherm areas were determined from the field data. Analytical predictions for field results of both centerline temperature reduction versus distance and surface isotherm areas show good agreement when discharge conditions are relatively constant for a period of an hour or more. Theoretical predictions of center-line temperature reduction versus distance and surface isotherm areas for the mid tide phase when the jet characteristics are changing most rapidly do not agree with the field results. An attempt to reduce the unsteadiness of the field conditions by time weighted average (1/2 tidal cycle) and comparison to the time weighted average of the theory was made for the centerline temperature reduction versus distance field results. The results were reasonably successful but the unsteady influence of the mid tide phase could not be completely eliminated by this method. Sensitivity of the analytical model to cross currents and heat loss coefficient were determined to be minimal. Changes in channel geometry at the mouth of the discharge channel occurred due to winter storms. Since the discharge channel geometry is not known exactly, a precise comparison with the analytical model is difficult particularly at low tide when the effects of changes in the exit section are most important. Winter weather conditions at the site prohibited continuous ambient current measurement by the power company. (Sinha - OEIS)

HANDBOOK FOR MONITORING INDUSTRIAL WASTEWATER.
Associated Water and Air Resources Engineers, Inc., Nashville, Tenn.
Environmental Protection Agency Office of Technology Transfer Handbook, August 1973. 175 p, 59 fig, 24 tab.

Descriptors: *Monitoring, *Industrial wastes, *Water pollution control, Instrumentation, Water analysis, Sampling, Data collections, Automation, Municipal wastes.
Identifiers: *Combined treatment.

Information is presented for use and reference in planning, executing and continuing a program of industrial waste monitoring. Philosophy of monitoring needs, planning, sampling, measuring, and analysis are presented for familiarization by industrial plant managers. Sufficient detail is given for those who wish to explore more deeply some of the practical and theoretical aspects of monitoring programs. A logical procedure is suggested and direction given for industrial plant waste control programs. Automated sampling, measuring, and analytical devices are described and methods of use outlined. Manual procedures and non-automated methods are also presented. Use of the collected data is discussed. Special considerations for industrial-municipal joint treatment are described. Numerous references are included for the reader who needs more detailed information on special tests, equipment or procedures necessary for the successful conduct of a monitoring program. OXYGEN ANALYZER,
Lowrance Electronics, Inc., Tulsa, Okla. (Assignee).
H. A. Cramer.
U.S. Patent No. 3,782,170, 3p, 3 fig, 2 ref; Official Gazette of the United States Patent Office, Vol 918, No 1, p 179, January 1, 1974.

Descriptors: *Patents, *Dissolved oxygen, *Instrumentation, Measurement, Water pollution, *Oxygen, Electrodes, Monitoring, Pollutant identification.

A small instrument can be inserted into a body of water or other liquid to make a determination of the concentration of free dissolved oxygen in the water. It comprises a cylindrical tube with an end plate and a permanent magnet placed coaxial with the tube with its south pole in contact with the end plate. The length of the magnet is approximately one half or less the length of the cylindrical tube. A pair of electrodes are positioned in the wall of the

ube, approximately at the middle of the length of he tube. A disc having a number of holes to permit assage of water axially along the inside of the ube, is mounted across the cross section of the ube, closely spaced from the electrodes. When a attery is connected to the electrodes a current vill flow. Negative ions will be deflected by the nagnetic field toward the magnet and so will be in-ercepted by the grid. The magnitude of this cur-ent can be determined by a meter which is con-ected in the lead from the grid to the positive pole f the battery. (Sinha-OEIS)

NITROGEN UPTAKE EFFICIENCY BY FOUR PLANT SPECIES IN THE FIELD AND GROWTH CHAMBER,
Purdue Univ., Lafayette, Ind. Water Resources Research Center.
L. H. Edwards, D. D. Warncke, S. A. Barber, and D. W. Nelson.
Available from the National Technical Information Service as PB-229 638, $6.00 in paper copy, $1.45 in microfiche. Technical Report No. 40, 1973. 48 p, 2 fig, 25 tab, 7 ref. OWRR B-026-IND(3).

Descriptors: *Groundwater, *Nitrates, *Farm management, *Root development, *Deep percolation, Crop production, Planting management, Soil management, Underground field crops, Nitrogen compounds, Ammonium salts, Root systems, Absorption, Soil-water-plant relationships, *Path of pollutants, Water pollution control.
Identifiers: Ammonium-nitrate ratios, Shoot-root ratio, Uptake coefficient.

Cropping patterns were studied to ascertain how most effectively to reduce the level of nitrate in the soil to lessen the amount subject to leaching and moving into drainage water. Sorghum and sudax grown in the field removed greater amounts of nitrogen than corn or wheat. In corn, the nitrogen flux into a root reached a maximum by 18 to 24 days and decreased rapidly to tasselling. The amount of nitrogen leaching from the soil can be reduced if added only in the ammonium form and maintained as ammonium by imbibition. Comparisons made between ammonium and nitrate in nutrient cultures for corn showed that the two sources of N were absorbed at equal rates at all stages of plant growth. The research showed that the plant roots of a number of common crop species had the ability to reduce the nitrate in solution to very low levels. The level found in the soil after cropping was one to two orders of magnitude larger than this apparently because the nitrate must move to the root before it is positionally available for absorption. Cultural practices that increase root density, particularly in the subsoil should cause more efficient nitrogen use.

MASS TRANSFER IN HETEROGENEOUS SYSTEMS AND VELOCITY AND GAS ABSORPTION STUDIES FOR SINGLE BUBBLES,
Iowa State Univ., Ames. Dept. of Chemical Engineering.
A. Mukerjee.
Available from the National Technical Information Service as PB-229 560, $17.50 in paper copy, $1.45 in microfiche. Ph D Thesis, 1973. 263 p, 57 fig, 12 tab, 77 ref. OWRR B-030-IA(1).

Descriptors: *Mass transfer, *Surfactants, *Bacteria, *Bubbles, Aeration, Dissolved oxygen, Reaeration, Oxidation, Fermentation, Water pollution effects, Water pollution treatment.

The effects of surface active materials on gas absorption were studied in reactive and nonreactive systems. Bacterial cell particles including Acetobacter rancens, Acetobacter suboxydans, and Acetobacter xylinum, increase the mass transfer rate of oxygen in the oxidation of glucose to gluconic acid at pH 6.12. Direct uptake of oxygen by the cells, decrease in the film thickness, and local surface turbulence were demonstrated. The presence of surfactants (1 ppm to 500 ppm) retards the rise velocity 40% for bubbles 0.31 cm diameter and 24% for bubbles 0.49 cm to 0.58 cm diameter. The concentrated interfacial layer of surfactant molecules shifts the point of separation, increases the drag force and imparts a rigid sphere behavior. Rise velocity of soluble bubbles in general is retarded by the simultaneous mass transfer process. For the range of bubble sizes examined, the rate of mass transfer from smaller bubbles is higher. A differential equation was derived to describe the phenomenon of a dissolving oxygen bubble rising in a frozen lake. Parameters such as lake depth, temperature profile, BOD, and pollutant concentration are considered in dimensionless form. Numerical solutions indicate a striking difference in gas absorption due to the effect of surface active pollutants and suggests the feasibility of artificially oxygenating frozen lakes and streams to raise the DO concentration in the winter months. STAFF REPORT ON COAL GASIFICATION: PROCESSES AND EFFECTS,
Pacific Northwest Environmental Research Lab., Corvallis, Oreg.
J. P. Chasse.
Manuscript, October 1973. 28 p, 5 fig, 1 tab, 12 ref.

Descriptors: *Hydrate processes, *Thermal pollution, Chemical reactions, Coals, Carbon, Gases, Industrial production, *Fossil fuels, Nuclear powerplants, Thermal powerplants, Steam turbines, Electric power production, Environmental effects.
Identifiers: *Coal gasification.

Coal gasification offers enormous potential both for alleviating projected shortages of natural gas for consumer use and for fueling advanced-cycle electric generating units. The first circumstance has already achieved limited commercial application and is receiving significant research effort to develop new processes. The latter situation, while requiring a less sophisticated gasification process, is at a lesser stage of development. This is primarily due to a lack of technology relative to the integrated gasification/power generation system. The projected commercial size installations are 250 x 1,000,000 scf/day for high-Btu pipeline gas (950 Btu/scf) and 700 x 1,000,000 scf/day for low-Btu fuel gas (175 Btu/scf). On that scale, pipeline gas production is a more potential threat to the environment, primarily due to its lower anticipated efficiency: 65 percent versus 82 percent for the fuel gas plant. The substitute natural gas plant will consume up to 25,000 tons of coal and 9 million gallons of water per day. In doing so it will generate up to 250 tons of sulfur and 5,000 tons of ash per day. The fuel gasification/power generation system, however, promises to be less polluting than the alternative fossil-fuel steam plant. Comparison of the two coal gasification processes is, of course, artificial being dependent on the actual scale of the operations. Nevertheless, when compared with the alternative fuel sources, high-Btu gas will present more difficult problems. A major advantage of the gasification/generation system will be the potential for reduced thermal pollution. If thermal efficiencies of 82, 85, and 88 percent are achieved for the first, second, and third-generation gasification processes, the thermal heat rejection for the COGAS system can be estimated. The overall efficiencies include a 2 percent loss in the generator and a 2 percent pumping load. Liquid thermal pollution for a combined-cycle operation would be considerably less than for a conventional electric generating plant. Problems of make-up water supply would be correspondingly diminished.

ASSESSMENT OF THE LOSS OF RADIOACTIVE ISOTOPES FROM WASTE SOLIDS TO THE ENVIRONMENT. PART 1: BACKGROUND AND THEORY,
Oak Ridge National Lab.
H. W. Godbee, and D. S. Joy.
Available from NTIS, Springfield, Va., as ORNL-TM-4333, $5.45 per copy, $1.45 microfiche. Report No. ORNL-TM-4333, February 1974. 65 p, 5 fig, 7 tab, 34 ref.

Descriptors: *Nuclear wastes, *Waste treatment, *Waste disposal, Environment, Radioisotopes, *Solid wastes, Leaching, Path of pollutants, Water pollution, Soil contamination, Degradation(Decomposition), Assay, Safety, Public health.

Assessments of the amounts of radioactivity from waste solids that enter the environment are needed for engineering, economic, and safety evaluations of proposed waste treatment, storage, transport, and disposal systems. This report presents several theoretical expressions based on mass transport phenomena that relate the radioactivity escaping from such solids to diffusion, dissolution processes, surface conditions, and radioactive decay. Representative available data for radioactive waste solids incorporated in cement, asphalt, ceramic and glass media are analyzed using the theoretical expressions presented. These analyses show that an expression taking into account diffusion and concentration-dependent dissolution gives good agreement with the data for most of the products considered. Once determined, parameters can be used to compare various waste products and to estimate releases from these products, in particular, long-term releases. (Houser-ORNL)

A STOCHASTIC STUDY ON THE CONCENTRATION PROCESS OF RADIOACTIVE SUBSTANCES TO AQUATIC ORGANISMS,
Kyoto Univ. (Japan). Dept. of Sanitary Engineering.
I. Aoyama, and Y. Inoue.
Health Physics, Vol 26, No 2, p 191-198, Feb 1974. 9 fig, 7 tab, 9 ref.

Descriptors: *Water pollution sources, *Radioisotopes, *Radiation effects, *Aquatic microorganisms, Aquatic environment, Equation, Mathematics, *Stochastic processes, Markov processes, Time series analysis, Operations research, Mathematical studies, Model studies, Water pollution effects.

In a previous paper, the authors attempted to explain the dynamic concentration process of radioactive substances in organisms using a Markov process. The phenomenon was well depicted when the concentration of the radioactivity in the environmental water was kept constant. In this paper, an attempt is made to explain the radioactive contamination of organisms as a time series using a birth-death process, which is one of the stochastic processes. The existing probability Pi(t) that the concentration step of organisms is in the concentration step 'i' at an arbitrary time t is given as follows: P sub i (t) equals (m(t) exp i/i factorial)-all raised to the minus m(t) power, where m(t) is a mean concentration step obtained from an exponential model. Using this analytical method, it is found that the theory can be applied generally to cases in which the concentration in the environmental water varies with time t and that the concentration distribution follows the Poisson distribution whose parameter m(t) is equal to the mean value of the concentration steps. Identifiers: Site selection, Streeter-Phelps equation.

Biodegradable matter introduced into a stream causes depletion of dissolved oxygen. The depletion rate and the re-aeration rate can be determined, and the reaction rate constants can be used to assess the effect of organic pollutants on river water quality. A methematical model based on the Streeter-Phelps equation was developed, which permits the dissolved oxygen level to be determined as function of pollution load and time. Illustrative examples of calculations are given. Such calculations should always be included in pulp mill site selection procedures, so as to minimize effluent damage to streams. (Trubacek-IPC)

This work was designed to investigate the effect of the manufacturers' formulations upon the behavior of Pirimiphos-ethyl and methyl and Menazon in the presence of natural adsorbents. Sixteen ppm active ingredient solutions of Pirimiphos-ethyl; Pirimiphos-methyl; JF2765 (Pirimiphos-ethyl emulsifiable concentrate); JF2764 (Pirimiphos-methyl emulsifiable concentrate); Menazon; and Saphizon D.P. (formulated Menazon) in 0.4 percent W.W. acetone in water were prepared. The above solutions were shaken with Ca-bentonite, Ca-kaolinite and Ca-peat (pH 5.5) with the ratio of 100:1 solution:solid, for 72 hours. Samples of the suspensions thus formed were taken at 0.5, 2, 5, 24 and 72 hours. The suspensions were centrifuged at 5000 rpm for 20 min and the supernatant was separated from the precipitate. After 5 hours and 72 hours, in the case of Pirimiphos-ethyl, Pirimiphos-methyl and their formulations, the precipitate was dried at room temperature overnight, and then extracted with hexane. UV spectra and GLC were taken from both the supernatant and the hexane extracts. Two interesting facts stand out from the results. Firstly, the unusual relatively high adsorption of Pirimiphos-ethyl upon Ca-kaolinite. Secondly, it seems that the adsorption of all pesticides is on slightly influenced the presence of the formulan Even this preliminary data using arbitrary form lations, indicate the potential stored in the use formulants for the purpose of affecting the chen cal and biological behavior of pesticides after a plication. FLOCCULATION OF SUSPENDED SEDIMEN IN THE SEA,
Bedford Inst., Dartmouth (Nova Scotia). Atlant Oceanographic Lab.
K. Kranck.
Nature, Vol 246, No 5432, p 348-350, December 1973. 3 fig, 17 ref.

Descriptors: *Sediments, *Sea wate *Flocculation, Inorganic compounds, Suspende solids, Particle size, Salinity, Water temperatur Mineralogy, Current, Turbidity, Analytic techniques, Straits, Inlets(Waterways), Bay *Canada.
Identifiers: Particle concentration, Sample prese vation, *Flocs(Inorganic), Fate of pollutant Coulter Counter.

To determine the nature and mode of formation inorganic flocs, the concentration, grain size a general nature of the suspended particulate matt in over 500 samples from a variety of coastal e vironments have been studied. The samples we stored cold and dark and analyzed as soon possible but always within a few days of colle tion. An inverted phase contrast microscope w used for qualitative identification of the partic late matter. The size and concentration of particl between about 1 and 100 microns were measure with a model T Coulter Counter and the resul plotted as particle spectra showing the equivale spherical diameter of the particle volume relati to concentration in parts per million. Flocs we observed in all samples and formed the majority particles in samples from highly turbulent area and from near the bottom in regions of mud sediment. The samples from these waters, high inorganic sediment when analyzed by Coult Counter, were characterized by regular, almo symmetrical, broad distribution with we developed modes. Total particle concentrations the flocculated samples varied from 0.5 to 20 p.p and modes usually ranged between 6 and microns. There was no relationship between th mode size and the concentration of particulat matter, nor did any difference in concentration particulate matter, nor did any difference mineralogical composition between the samples in the salinity and temperature of the seawate seem to have affected the flocculation process. distinct relationship was noted between mode siz and current speed of the water at the place of co lection. THE PRODUCTION OF PARTICLES IN TH SURFACE WATERS OF THE OCEAN WIT PARTICULAR REFERENCE TO THE SARGAS SO SEA,
Bedford Inst., Dartmouth (Nova Scotia).
R. W. Sheldon, W. H. Sutcliffe, Jr., and A. Prakash.
Limnology and Oceanography, Vol 18, No 5, 719-733, September 1973. 9 fig, 1 tab, 38 ref.

Descriptors: *Sea water, Surface waters, *Foo chains, *Primary productivity, Ecosystems Radioactivity techniques, *Particle size, Growt rates, Water sampling, Diurnal, Water tempera ture, Oceans, Incubation, Diatoms, Protozoa Zooplankton, Copepods, Marine fish, Marin animals, Marine bacteria.
Identifiers: *Sargasso Sea, ATP, Particle concen tration, Coulter Counter, Flagellates.

A series of observations and experiments hav shown that it is possible to increase our un

:rstanding of marine production simply by look-g at particle formation. Particle size and concen-ation were measured with a model T Coulter ounter. Many of the observations standardized n a particle size range from 1 micron to 100 icrons. This includes most of the particles likely be involved in primary production. The amount f living material was estimated from measure-ents of the adenosine triphosphate (ATP) con-ntration of the particulate material. Particle owth was measured by incubating sea water mples in bottles, the particle concentration olume and ATP) being measured before and ter incubation. The samples were collected at a pth of 1 m with a simple float and bottle sam-er. In the surface waters of the ocean particle oduction and consumption are in balance. The ructure of the pelagic food chain and the orphological limitations dictated by the environ-ent are such that, in general, large particles have consume smaller ones. If the large particles are moved the small particles cannot be consumed id their production rate can be measured. A state f exponential growth seems to be normal. The te of production, as revealed by small particle owth following predation release, is much eater than the apparent rate of primary produc-on indicated by radiocarbon uptake. (Mortland-attelle)

EMPORAL AND DEPTH STUDY OF AL-ALINE EARTH CHLORINITY RATIOS IN EAWATER AT A SINGLE STATION SOUTH F PUERTO RICO,
uerto Rico Univ., Mayaguez. Dept. of Marine ciences.
. K. Atwood, P. N. Froelich, and W. F. Kinard.
imnology and Oceanography, Vol 18, No 5, p 71-783, September 1973. 1 fig, 7 tab, 29 ref.

Descriptors: *Salinity, Calcium, Magnesium, trontium, *Temporal distribution, Depth, *Sea ater, Distribution patterns, Surface waters, olumetric analysis, *Puerto Rico, *Alkaline arth metals.
dentifiers: *Chlorinity ratios, Atomic absorption pectrophotometry, EDTA.

esults of an 11-month study of calcium, magnesi-m, and strontium chlorinity ratios at a single sta-on south of Puerto Rico are reported for depths own to 2,500 m. Samples were filtered through .45-micron Millipore filters and stored in high ensity polyethylene bottles at 2 C until analysis. alinities were determined to plus or minus 0.01 er thousand with an induction salinometer. Stron-um was determined by atomic absorption spec-oscopy with a spectrophotometer. Each sample as analyzed twice; once directly and once with a 0 ppm Sr spike added as an internal standard. Cal-ium was determined by first precipitating mag-esium as Mg(OH)2 by adjusting the pH to 12 with aOH solution, then determining the combined alcium and strontium by titration with ethylene iamine tetracetic acid (EDTA), and subtracting ie concentration of strontium. Magnesium was etermined by first determining the total concen-ation of calcium, strontium, and magnesium and ubtracting the concentration of calcium and trontium. This was done by titrating with di-Na-DTA at pH 10 using Eriochrome Black T as an dicator. No temporal variations for any of these tios were apparent within the precision of the nalytical techniques used; however, careful valuation of the variation in Sr:Cl per thousand ust await more precise analysis. There was some dication that Ca:Cl per thousand was lower in urface and near surface waters than below 500 m. onversely, there was evidence that the Mg:Cl per ousand was higher in upper waters than below 00 m. THE PERSISTENCE AND MOVEMENT OF PICLORAM AND 2,4,5-T IN SOILS,
North Carolina State Univ., Raleigh. Pesticide Residue Research Lab.
J. F. Lutz, G. E. Byers, and T. J. Sheets.
Journal of Environmental Quality, Vol 2, No 4, p 485-488, October-December 1973. 1 fig, 5 tab, 24 ref.

Descriptors: Persistence, Movement, *Path of pollutants, *Pesticide kinetics, *Watersheds(Basins), *2 4 5-T, Leaching, Chlorinated hydrocarbon pesticides, Soil physical properties, Chemical analysis, Sampling, Soil chemical properties, *North Carolina, Methodology, Herbicides, Soils, Environmental effects, Soil analysis, Solvent extractions, Cores, Soil temperature, Climatic data, Bulk density, Depth, Organic matter, Hydrogen ion concentration, Air temperature, Hydraulic conductivity, Porosity, Clay loam, Pesticide residues.
Identifiers: *Picloram, Electron capture gas chromatography, Sample preparation, Chemical recovery, Sandy loam.

The movement and persistence of picloram (4-amino-3,5,6-trichloropicolinic acid) and 2,4,5-T (2,4,5-trichlorophenoxyacetic acid) were studied on a western North Carolina watershed on which extensive agronomic, hydrologic, and climatic data had been accumulated over a period of 18 years. Immediately after spraying, 20 core samples were taken to a depth of 5 cm and composited for determination of the amount of herbicide reaching the soil. The samples were placed in polyethylene bags and frozen. Additional samples (10 cores each) were taken 15, 50, and 100 days after spraying. Prior to analysis, the samples were thawed, air-dried, and sieved through a 2-mm sieve. A 50-g sample was acidified with 0.25 N HCl, mixed with ethyl acetate, shaken for 30 min, and filtered. After a second extraction, the solvent was combined with the first extract which was then made basic with NH4OH. The herbicides were partitioned into water, the aqueous solution acidified, and the herbicides partitioned back into ethyl acetate. Base was added, the solvent evaporated and the herbicides dissolved in methanol, methylated with diazomethane, and determined by electron capture gas chromatography. Picloram was more persistent than 2,4,5-T; approximately 60 percent of the picloram and 90 percent of the 2,4,5-T disappeared in 15 days. There was some penetration into the soil, but a very high percentage of the total amount present at the different sampling periods was in the 0- to 7.5-cm layer. Doubling the application rate (4.48 vs 2.24 kg/ha) resulted in a two-fold increase in the amount of herbicide recovered at each sampling period. Very little downslope movement of either herbicide occurred even though the average slope on the plots was approximately 27 percent. Practically no herbicide was found more than 0.3 m, and none beyond 1.2 m, downslope. More picloram than 2,4,5-T moved. (Holoman-Battelle)

INOSITOL POLYPHOSPHATES IN ACTIVATED SLUDGE,
Commonwealth Scientific and Industrial Research Organization, Canberra (Australia).
D. J. Cosgrove.
Journal of Environmental Quality, Vol 2, No 4, p 483-485, October-December 1973. 1 fig, 2 tab, 12 ref.

Descriptors: *Activated sludge, Chemical analysis, *Pollutant identification, Methodology, Organophosphorus compounds, Phosphorus, Separation techniques, Hydrolysis, Solvent extractions, *Phosphorus compounds, *Phosphates, *Chromatography.
Identifiers: Sample preparation, Inositol polyphosphates, *Ion exchange chromatography, Paper chromatography, Organophosphates, Myo-inositol hexaphosphate, Scyllo-inositol hexaphosphate, Chiro-inositol hexaphosphate, Neo-inositol hexaphosphate, Myo-inositol pentaphosphate, Chiro-inositol pentaphosphate, Scyllo-inositol pentaphosphate, Neo-inositol pentaphosphate.

Although it is known that some of the soluble inorganic phosphate present in waste water can be fixed as organic forms in the activated sludge process, there is little knowledge of the chemical nature of these products. Recently, the extraction of 'inositol phosphate' from activated sludge was described, but whether the product consisted only of myo-inositol phosphates or was a mixture was not determined. In the present investigation, inositol polyphosphates were extracted from activated sludge using methods previously developed in investigations of soil organic phosphates. Ion exchange chromatography of the purified extract showed it to be a mixture of penta- and neo-inositol and thus to resemble the inositol polyphosphate component of soil organic matter. As the same polyphosphate mixture does not apparently occur in raw sewage (hydrolysates of dried raw sewage were found to contain no other inositol but the myo-isomer), it would appear that it is formed as a result of biological action during the aeration process. As a part of a water quality survey of the Spoon River, Illinois, algal genera were identified and their densities were enumerated. Weekly samples were collected at five stations starting on June 1, 1971. This report presents the first year's results. Algal densities for each station were found to be distributed geometrically normal. Total algal densities increased as water progressed downstream. Although water temperature has been observed to be an important factor affecnd the composition of algae in streams, attempts to correlate algal densities with temperatures for the Spoon River were not fruitful. Correlations of algal densities with dissolved oxygen, flow, and coliform densities also could not be made. The dominant genera observed were Cyclotella, Navicula, Scenedesmus, and Euglena. On the average diatoms accounted for 87 percent of all algae counts. The average

diversity indices varied about 1.0 to 1.5 for five stations. There did not appear to be any advantage in the use of diversity index over that of algal density and genera richness in characterizing algae in the Spoon River. (Holoman-Battelle)

NITROGEN TRANSFORMATIONS IN SEDIMENTS AS AFFECTED BY CHEMICAL AMENDMENTS,
Wisconsin Univ., Madison. Dept. of Soil Science.
R. L. Chen, and D. R. Keeney.
Water Resources Bulletin, Vol 9, No 6, p 1136-1144, December 1973. 8 tab, 27 ref.

Descriptors: *Nitrogen, Sediments, Lakes, *Lake sediments, Hydrogen ion concentration, Water quality, Nitrification, Denitrification, Nitrogen fixation, *Calcium carbonate, Ammonification, Acids, Methane, *Wisconsin, Ammonia, Phosphorus, Iron, Oxygen, Calcium, Nitrates, Nitrites, Calcium chloride, Magnesium compounds.
Identifiers: Aluminum sulfate, Mineralization, Immobilization, Calcareous sediments, Sample preservation, Sodium carbonate, Acetylene reduction, Biotransformation, *Lake Mendota(Wis.), *Lake Tomahawak(Wis.).

A study was conducted to elucidate some of the chemical factors affecting the rate and pathways of N transformations in lake sediments. The main emphasis was placed on modifying a noncalcareous sediment with CaCO3 to approximate the composition of a sediment. Additionally, the effects of Ca (2 plus), CO3 (2 minus), Mg (2 plus) and OH (minus) were evaluated by using appropriate chemicals. Further, the effect of aluminum sulfate was evaluated with both sediment types. Sediment pH at 7 days was not affected by CaCO3, but was decreased by aluminum sulfate. The CaCO3 treatment increased the rate of ammonification, nitrification, reduction of acetylene to ethylene and methane formation, while with few execptions the other treatments decreased the rate of the transformations studied. Aluminum sulfate, which has been proposed as a lake restoration treatment, increased ammonification but decreased most of the other transformations. (Mortland-Battelle)

Identifiers: Acetylene, Carbon reduction, Helium atmosphere, Sample preservation, *Lake gases.

The ability of lake sediment samples to store and synthesize methane was tested using samples from Wisconsin lakes. Both hardwate and softwater lakes were investigated. The effects of nitrate, sulfate, and acetylene amendments, as well as temperature, were also investigated. Using a sediment-coated glass bead system as described, sediments showed linear increases in methane synthesis from the moment helium purging ceased for periods up to three weeks. The results indicate that the sediment samples examined have roughly the same capacity to store methane generated in vivo, but depending upon their origin (e.g. softwater or hardwater lakes) differ significantly in their capacity to synthesize methane from sediment precursors. Sediment samples from hardwater lakes produced 10 to 20 times as much methane as sediment from softwater lakes. This difference in methane generating capacity appears to be due to CaC03. It is apparent that measurement of standing crop of 'native methane' in sediments may not be a useful indication of the actual rate of methane synthesis. Both nitrate and sulphate were apparently able to inhibit methane synthesis by raising the Eh of the sediment to more positive values. Inhibition, at least by nitrate, may be temporary. (Mortland-Battelle)

TREND SULFACE ANALYSIS AND SEASONAL DISTRIBUTION PATTERNS OF PRIMARY NUTRIENTS AND CHLOROPHYLL IN UNSTRATIFIED GULF COAST ESTUARIES,
Texas Univ., Houston. School of Public Health.
I. Cechova, and E. M. Davis.
Water Resources Research, Vol 8, No 6, p 1543-1554, December 1973. 11 fig, 1 tab, 9 ref.

Descriptors: *Distribution patterns, *Nutrients, *Estuaries, Water pollution sources, *Seasonal, *Dispersion, *Chlorophyll, Mapping, *Texas, Mixing, Runoff, Phosphorus, Nitrogen, Carbon, Spatial districution, Data processing, Phosphates, Nitrates, Nitrites, Primary productivity, Movement, Temporal distribution.
Identifiers: Symap, Chlorophyll a, Data interpretation, Enrichment, Fate of pollutants.

The technique of data display, the synographic mapping system (Symap), was applied in ecological studies of unstratified Gulf Coast estuaries. Thirty-four computer maps of spatial distribution of primary nutrients and chlorophyll concentrations in San Antonio and Matagorda (Texas) estuaries were prepared from survey data covering the period 1970-1971. The maps provided a convenient means for detecting the sources of estuarine enrichment by primary nutrients and of seasonal changes in dispersion patterns. Weighted average concentrations of each compound in the entire estuarine water mass were determined from such displays and used in comparison of concentrations for different months of the survey period. The data presented on Symap displays were used in the determination of mixing and exchange efficiency in the estuaries. The results indicated that incoming nutrients often have very short residence times. The efficiency of exchange and residence time of each compound vary significantly within a year, conditioned by variable compound loading, quantity of tributary runoff, range of tidal activity, and variable biological food demand. An attempt was made to relate the chlorophyll a concentrations obtained as weighted averages from Symap displays to concentrations a phosphorus, nitrogen, and carbon, to the amount of tributary runoff, and to yearly seasons by means of coaxial graphical correlation. NITROGEN FIXATION IN A SUBARCTIC MIRE,
Kungliga Lantbrushogskolan, Uppsala (Sweden).
U. Granhall, and H. Selander.
Oikos, Vol 24, No 1, p 8-15, 1973. 2 fig, 6 tab, 26 ref.

Descriptors: *Nitrogen fixation, *Nitrogen fixing bacteria, *Cyanophyta, *Permafrost, *Marshes, Methane bacteria, Subarctic, Cold regions, Bogs, Mosses, Lichens.
Identifiers: *Acetylene reduction, *Sweden(Lappland).

An investigation of biological fixation of atmospheric nitrogen in situ, as part of the Swedish IBP Tundra Biome Project, was carried out during the summer of 1971. The main site was a subarctic - continental, ombrotrophic mire with permafrost, situated near Abisko in Lappland (northern Sweden). Nitrogen fixation was measured by the method of acetylene reduction. Samples of moss and algae were examined microscopically for N-fixing blue-green algae. Aerobic N-fixing bacteria were estimated on a modified Burk's Azotobacter medium. Methane-producing bacteria were cu tivated in Barker's selective medium. Lo nitrogen fixation, mainly by aerobic bacteria, o curred in elevated (ombrotrophic) areas of t mire. In large wet depressions and pools, on t other hand, fixation by blue-green algae was qui appreciable. The algae were found to be epiphy cally or intracellularly associated with Sphagnu and Drepanocladus mosses. Lichens with blu green algal phycobionts or cephalodia were rare the investigated site, and the few plants test showed comparatively small activity, probab due to poor nutritional status (ombrotrophic conc tions). In other parts of the Tornetrask area th were, however, considered to be of great i portance. (Little-Battelle)

TRANSPORT, FATE AND GEOCHEMICAL I TERACTIONS OF MERCURY, CADMIUM AN OTHER INORGANIC POLLUTANTS IN TH COASTAL LITTORAL-SALT MARSH E VIRONMENT OF THE SOUTHEASTER UNITED STATES.
Skidaway Inst. of Oceanography, Savannah, Ga.
Available from the National Technical Inform tion Service as PB-230 037 $6.00 in paper cop $1.45 in microfiche. Annual Progress Repo January 1974. 242 p. EPA R-800372.

Descriptors: *Path of pollutants, *Heavy metal *Estuaries, *Water chemistry, *Atlantic Coast Plain, Mercury, Cadmium, Copper, Iron, Ma ganese, Salt marshes, Water chemistry, Organ matter, Sorption, Chemical precipitatio Suspended load, *Southeast U.S., South Carolin Georgia, Florida.

Study of the transport, fate, and geochemical i teraction of heavy metals (primarily mercury a cadmium) being transported into the littoral s marsh environment in the Southeastern Unit States Coast between Georgetown, S.C., a Jacksonville, Fla., involves both field and labor tory studies. The concentration of Hg, Cd, Cu, I and Mn in water and suspended sediments sampl

m the major rivers emptying along the utheastern Atlantic Coast was determined nonthly to establish seasonal and spatial varia-ns. The flux of heavy metals through salt marsh tuaries is controlled by processes which occur at ver-estuary and salt marsh-sediment boundaries. iese processes include adsorption-desorption actions, flocculation, precipitation and sedimen-ion. Along with estuarine circulation they effec-ely control the residence time of metals in tuaries. Some biological processes, such as up-ce by marsh vegetation, may serve as efficient echanisms to recycle metals otherwise lost to tuarine sediments. Upon entry into estuaries in er runoff a large portion of dissolved iron and anganese precipitate out of solution and accumu-e in sediments along with particulate fractions these metals. Most cadmium and copper in solu-n is transported through salt marsh estuaries hile particulate fractions are apparently lost to e sediments. All dissolved mercury and ap-rently a desorbable fraction of that in particulate atter is transported through the salt marsh stem. (See also W74-05502 thru W-74 05506) .napp-USGS)

lentifiers: *Satilla River(Geo.).

In a comprehensive study of the distribution of organic and inorganic constituents in natural waters, the chemical compositions of several rivers flowing through the Coastal Plain of southeast Georgia (the Satilla River, in particular) have been investigated. These streams are generally characterized by low suspended load, low ionic strength, low pH values, and a predominance of organic over inorganic constituents. The dominance of sodium and chloride among inorganic ions indicates that rainfall is a major factor in determining the distribution of major elements in these waters. The low pH values and the relatively high concentrations of iron and aluminum appear to result from the high concentrations of organic matter. River water organic matter is chemically similar to soil fulvic acids. The dominance of organic matter over inorganic constituents and the resultant low pH values of these waters are in direct contrast with the chemical compositions of most of the rivers of the world which have been previously studied. CHEMICAL CHARACTERISTICS OF DISSOLVED ORGANIC MATTER IN RIVER WATER,
Georgia Inst. of Tech., Atlanta.
S. J. Martin.
Skidaway Institute of Oceanography Annual Progress Report (EPA Project No R-800372), Appendix C, p 119-170, January 1974. 7 fig, 6 tab, 32 ref.

Descriptors: *Path of pollutants, *Heavy metals, *Estuaries, *Water chemistry, *Atlantic Coastal Plain, Mercury, Cadmium, Copper, Iron, Manganese, Salt marshes, Water chemistry, Organic matter, Sorption, Chemical precipitation, Suspended load, *Georgia.
Identifiers: *Satilla River(Geo.).

Dissolved organic matter from the Satilla River, a Coastal Plain river of southeast Georgia, and a tributary swamp was studied by separation into chromatographically homogeneous fractions. The oxygen-containing functional group content of each fraction increases with decreasing molecular weight. Total acidity ranges from 7.3 to 12.9 meq/g, and carboxyl group content from 3.2 to 9.5 meq/g. River water organic matter close to a swamp source shows lower total acidity and carboxyl group content when compared to organic matter further downstream. Carbon ranges from 40.0% to 54.3%, hydrogen from 3.4% to 5.6%, nitrogen from 0.7% to 1.9%, and oxygen from 39.6% to 55.3%. The molecular weight of the unfractionated organic matter is 1322, and is in close agreement with the molecular weight of 1266 determined on the original material. The fraction with the highest molecular weight is similar to humic acid, but accounts for only a small portion of the total organic matter, the rest of which resembles fulvic acid. Humic substances of a rather narrow molecular weight range are leached from a swampy, low relief area. As they are transported downstream, the higher molecular weight portion is removed from solution by flocculation. The soluble organic matter remaining exerts control on the water chemistry of the river through exchange reactions with the inorganic constituents and through dissociation. Since the transportation and accumulation of toxic pollutants such as heavy metals is greatly influenced by their association with river water organic matter, the results of this study should be of interest to those concerned with environmental problems. OIL IN SCOTTISH WATERS,
Office of Naval Research, London (England).
J. M. Leonard.
Available from NTIS, Springfield, Va 22151 as AD-766-432 Price $3.00 printed copy; $1.45 microfiche. Conference Report C-12-73, June 1973. 6 p.

Descriptors: *Oil spills, *Water pollution effects, *Water pollution treatment, *Conferences, Atlantic Ocean, Biodegradation.
Identifiers: *Scotland.

The petroleum discoveries in the northern North Sea and their implications for the ecology of Scotland's waters was the theme of the third annual meeting of the Scottish Marine Biological Association in Stirling. This is a 6-page summary of that meeting. The topics discussed include: exploration and production of North Sea oil, with reference to ecological aspects; problems of oil pollution and combating oil; use of oil dispersants; oil degradation by bacteria; hydrocarbons in the marine environment; and Littorina saxatilis as an index of dispersants. PRIMER ON AGRICULTURAL POLLUTION,
C. P. Gratto, W. R. Webber, F. G. Viets, Jr., J. P. Law, and J. L. Witherow.
Journal of Soil and Water Conservation, (Vol 26), p 44-65, March-April 1971. 22 p, 5 tab.

Descriptors: *Agriculture, *Water pollution sources, *Farm wastes, Management, *Water quality, *Water conservation, Sediment, Fertilizer, Irrigation practices, Waste disposal, Fertilization, Crop production, Productivity, Water requirements, Soil treatment, Pesticide residues, Chemical wastes, Pollutants, Contamination(Water), Sedimentation, Sediment yield.

The five major groups of pollutants generated by agriculture are animal wastes, fertilizers, irrigation residues, pesticides, and sedimentation. Growing concern about animal waste treatment, use and disposal coincides with the public's concern about the overall problem of waste management and environmental quality. High density confinement of livestock compounds the problems of waste utilization or disposal. Environmentalists argue that since nitrogen and phosphorous are factors in eutrophication, nitrogen fertilizers contribute to

both surface and groundwater pollution. Evidence indicates the probable connection between water quality deterioration and increased fertilizer use. Water quality problems resulting from irrigation are primarily due to the fact that irrigation is a major water consumer. Plants extract water from the supply, resulting in a concentration of dissolved mineral salts, present in all natural waters. Irrigation also adds pollutants by leaching natural salts and other materials from the soil. Special attention must be given to the rates of accumulation of pesticides and their breakdown products in soil, to the extent of contamination of water resources. Sediment has a twofold environmental effect. It depletes the land resource from which it is derived and impairs the quality of water which it is deposited in. (Silber-Florida)

AQUATIC ANOMALIES: SYMPTOMS OF A SICK OCEAN,
Florida Conservation Foundation, Winter Park. Environmental Information Center.
B. Barada.
The Florida Naturalist, Vol 46, No 4, p 2-12, 1973. 13 photo.

Descriptors: *Water, *Water pollution, *Water pollution sources, *Environmental effects, Ecology, Marine animals, Marine biology, Marine fisheries, Shellfish, Algae, Nutrients, Oxygen, Oxygen demand, Toxicity, Water purification, Coasts, Oceans, Water pollution effects, Ecosystems, Wastes, Waste dilution.

A few years ago a study was begun of aquatic anomalies regarding destruction and deterioration of fisheries, shellfish beds, habitats of sea birds and unexplained algal blooms. Practically all of these aquatic anomalies are directly or indirectly associated with pollution. The criteria for evaluating the extent and degree of marine pollution are inadequate, since they are based on the fallacy that the ocean has an unlimited capacity to dilute waste water effluent without harm to the marine ecosystem. The quality of receiving waters is measured in terms of biological oxygen demand, dissolved oxygen and coliform bacteria counts, all of which theoretically determine if the water is receiving a greater quantity of nutrients than its natural purification processes can handle. Usually, however, if there is sufficient dissolved oxygen in the water, the water is classified as not badly polluted. Many toxic persistent compounds do not become diluted, but rather accumulate in the ecosystem, and can be lethal to marine flora and fauna. Florida's marine resources are particularly vulnerable because the toxic effects of practically all marine poisons and diseases are exaggerated in warmer waters. (Ritchie-Florida)

A SMALL OIL SPILL,
Woods Hole Oceanographic Institution, Mass.
M. Blumer, H. L. Sanders, J. F. Grassle, and G. R. Hampson.
Environment, Vol 13, No 2, p 2-12, March 1971. 2 map, 2 photo.

Descriptors: *Oceans, *Water pollution sources, *Oily water, *Oil wastes, *Aquatic life, Industrial wastes, Sea water, Contamination, Aquatic environment, Waste discharge, Wastewater disposal, Chemical wastes, Food, Food chains, Fishlife, Water pollution effects, Fishkill, Pollutants, Toxins, Water quality, Impaired water quality, Coasts.

Oil pollution of the ocean is an increasingly serious global problem. The oils in petroleum are different in composition and toxicity from those occurring naturally in living marine organisms. These differences present a threat to ocean life and ultimately to human welfare, particularly in view of the scope of the pollution. Scientists point out that the major catastrophes such as tanker wrecks receive the headlines, but the smaller day-to-day spills in coastal waters and harbors of the world produce chronic pollution much larger in volume and probably more severe in biological consequences. Chronic oil pollution contaminates nearshore waters that are the key to the survival of most marine animals that are taken for man's food. Over a long period of time, this persistent pollution may interfere with the normal life processes of the organisms--as well as killing them outright at high concentrations. The result may be progressive disappearance of usually abundant fish and shellfish. Their decline would be accompanied by an increase in pollution-tolerant species that generally indicate an unhealthy state of biological affairs. Furthermore, remaining organisms of food value to man may be permanently contaminated with petroleum hydrocarbons that could be hazardous to health. (Silber-Florida)

DIFFUSION OF CATTLE MANURE SOLUTION THROUGH A WET POROUS STRATUM WITH REACTION,
Kansas State Univ., Manhattan. Dept. of Chemical Engineering.
S. K. Choi, L. T. Fan, L. E. Erickson, and R. I. Lipper.
Water Air Soil Pollut. Vol 1, No 4, p 390-404. 1972. Illus.
Identifiers: *Diffusion, *Manure(Cattle), *Mathematical models, Pollution, Porous media, Solution, Stratum, Water pollution sources, *Chemical oxygen demand.

A processing governing the transport rate of cattle manure as measured by COD through a wet porous stratum is investigated under simulated conditions. A mathematical model of the system is presented. The model simulates diffusion and biological reaction processes taking place simultaneously in the system. Experimental observations determine the diffusion coefficient and the biological reaction rate constant of the cattle manure solution. Values of approximately 6,760,000 sq cm/5 for the diffusion coefficient and 0.0305/day for the reaction rate constant at the temperature of 25 plus or minus 2C are obtained. For the system with a known diffusion coefficient and reaction rate constant, the analytical expressions can be used to approximately evaluate or predict the rates that animal wastes will contaminate surface water, soil or ground water.--Copyright 1973, Biological Abstracts, Inc.

ON THE NECESSARY AND SUFFICIENT CON DITIONS FOR A LONG-TERM IRRIGATE AGRICULTURE,
Economic Research Service, Davis, Calif. Far Production Economics Div.
C. V. Moore.
Water Resources Bulletin, Vol 8, No 4, p 802-81 August, 1972. 3 fig, 12 ref.

Descriptors: *Water quality, *Irrigation effect *Salinity, Salt balance, Irrigation practices, Wat management(Applied), Drainage, Water pollutio sources, Soil analysis, Soil chemical properties, I rigated land, Irrigation water.

Salinization and water logging have been th nemesis of irrigated agriculture societies. Lo quality water substitutes for high quality water f irrigation at an increasing rate up to the limits the soil's ability to transmit the additional wat and remove excess salts from the root zone. So transmissibility can be increased by additional i vestment in drainage ditches and underground til Low valued high salt tolerant crops can be sul stituted for higher valued salt sensitive crops t maintain production in areas served by irrigatio water sources of deteriorating quality. Thus phys cal factors specify the necessary conditions f survival of an irrigated agriculture. The conditio for survival must be in terms of a positive net i come in each subplanning period discounted to i present value. (Skogerboe-Colorado State)

MOVEMENT OF NITRATES UNDER IR RIGATED AGRICULTURE,
Nebraska Univ., Lincoln. Coll. of Engineering ar Architecture.
D. M. Edwards, P. E. Fischbach, and L. L. Youn Transactions of the ASAE (American Society Agricultural Engineers), Vol 15, No 1, p 73-7 January-February, 1972. 6 fig, 14 ref.

Descriptors: *Nitrates, Nitrogen, *Water pollutio sources, Leaching, Water quality contro Nutrient removal, Fertilizers, *Nitrogen con pounds, *Path of pollutants.

Nitrate nitrogen is highly soluble in water, there b posing a threat of water pollution. A coordinate sequence of laboratory and field studies were co ducted. Both mechanical placement and hydraul injection were used to apply the fertilizer. The fo lowing conclusions were drawn: 1. once nitrat move below the soil surface they do not re-ent the runoff water; 2. nitrates move with the wettin front; 3. with a properly managed irrigation syste little or no movement of nitrates outside the ro zone should occur. WATER-LEACHABLE NUTRIENTS FRO FROZEN OR DRIED PRAIRIE VEGETATION,
South Dakota State Univ., Brookings. Dept. Plant Science.
E. M. White.
J Environ Qual. Vol 2, No 1, p 104-107, 1973. Illus
Identifiers: Dried ground, Frozen groun Minerals, *Nutrients, *Prairies, Runof *Vegetation, Water quality, *South Dakot Leaching.

Runoff from agricultural lands in South Dakota mainly from melting snow and spring rain Nutrient enrichment of this water may b enhanced during the fall and winter by the ruptu ing of plant cells by freezing. Native prairi vegetation and mulch were sampled in la summer, early fall, and spring to determine the e fect freezing, in comparison to drying, would hav on nutrient release to water. Release of Ca, Mg, K P, NO3-N, NH4-N by freezing was related t stage of growth or decomposition of the vegeta tion. Freezing increased nutrient release if th vegetation were growing when it was frozen. So genesis, ecological relations between plant spe

s, and runoff water quality could be affected by relative release of different kinds of nutrients.- opyright 1973, Biological Abstracts, Inc.

scriptors: *Tides, *Pollutants, Marinas, imulation analysis, *Dispersion, California, mputers.
ntifiers: *Tidal flushing, Marina del Ray(Calif).

lal flushing characteristics of Marina del Rey re investigated by computer simulation. cause of the special geometry of Marina del Rey ich can be approximated by one-dimensional gments, the model developed by Fischer (a thod of Predicting pollutant Transport in Tidal aters, a University of Calif. at Berkeley, Water sources Center Contribution No. 132, 1970) is ed for the simulation process. A mass-conservan equation is used with tidal data to compute al flows. Dispersion of pollutants between fluid ments is calculated using a modified Elder's uation for dispersion in wide open-channel flow. ne proceeds in a series of finite steps, each of ich has a convective part and a dispersive part. ta for the program are provided from tide cordings made at various points in the marina. e results show comparative flushing characristics for pollutants discharged at various locans in Marina del Rey. The most striking characristic of the marina is its sensitivity to variations locations and time of pollutant injections. The in channel has a great deal more flushing activi than the basins. The timing of pollutant injecns relative to tidal phases is very important in termining what percentage of material will be shed out in a given time. (Sinha - OEIS)

MODEL OF A NUTRITIONAL ECOSYSTEM O CONSERVE NUTRIENTS FOR MAN,
ashington State Univ., Pullman. Dept. of Animal ience.
P. Kromann.
ltr Rep Int. Vol 7, No 1, p 33-43, 1973, Illus.
entifiers: Algae, Animals, Conservation, cling, *Ecosystem(Nutritional), Fauna, Fish, ora, Model studies, *Nutrients, Pollution, Rumints, *Recycling.

model of a nutritional ecosystem is described as system of recycling nutrients in an ecological, osed' system. It is an integration of several tural ecosystems which would utilize the 'waste oduct nutrients' of man. The ecosystem could minate these nutrients from polluting environental air and water, thereby conserving energy, otein, vitamins and minerals which are needed nourish a growing and hungary population. The trients would be conserved by simple mached and ruminant animals, plants, croflora (algae), microfauna and fish. The trients of these plants and animals would be utiled by man, other animals or plants. Nutrients in e excrement of animals would also be recycled. on-polluted water (possibly potable water) and O2 would also be obtained from this system.--Copyright 1973, Biological Abstracts, Inc.

THE INTERDEPENDANCE OF MARINE AND ESTUARINE ECOSYSTEMS IN SOUTH AFRICA,
Natal Univ., Durban (South Africa). Oceanographic Research Inst.
A. E. F. Heydorn.
S Afr J Sci. Vol 69, No 1, p 18-24, 1973, Illus.
Identifiers: Depletion, *Ecosystems, *Estuarine environment, Eutrophication, *Marine environment, Oxygen, Poison, Salinity, Silt, *South Africa(Natal), Hydrogen ion concentration.

The main features of the ecology of the coastal regions of Natal are described to illustrate that the terrestrial and marine ecosystems cannot be placed into 2 separate compartments. Estuaries in particular represent areas of overlap of land and sea, and life in them is therefore exceptionally rich. The wide range of organisms living in them in a state of interdependence renders estuaries vulnerable to man-induced environmental changes which can upset the natural equilibrium. Such changes can be in the form of siltation, eutrophication, O2 depletion, poisoning, or the upsetting of salinity balances of pH-levels. Most of these phenomena can be illustrated by Durban Bay or St Lucia. It is also clear that these organisms do not distinguish between individual estuaries but depend upon Natal's estuarine environment as a whole. Coastal currents and water movements provide effective longshore transport mechanisms for a multitude of planktonic and other drifting forms of life including juvenile fish and prawn larvae. Thus the deterioration of Durban Bay and St. Lucia should not be regarded as 2 independent events, nor will the development of Richards Bay as a major harbor merely be of local ecological consequence.--Copyright 1973, Biological Abstracts, Inc.

A FACTOR ANALYSIS OF SELECTED WATER QUALITY VARIABLES IN CENTRAL NEW JERSEY DURING 1960-1969,
Rutgers-The State Univ., New Brunswick, N.J. Dept. of Geography.
R. M. Hordon.
Paper No H-58, presented at 53rd Annual Meeting of the American Geophysical Union, Hydrology Section, April 17-21, 1972, Washington, D.C., 22 p, 3 fig, 7 tab, 18 ref.

Descriptors: *Urbanization, *New Jersey, *Water quality, *Statistical methods, Correlation analysis, Computer programs.
Identifiers: *Factor analysis, *Raritan River Basin(N.J.).

Spatio-temporal changes in water quality in central New Jersey during 1960-69 were studied by a factor analytic methodology. The period included suburbanization with its resultant impact on watershed quality and periodic events such as the record drought of 1962-66. Eleven variables were available at each of three stations: temperature, pH, DO, turbidity, BOD, color, alkalinity, hardness, bacteria, discharge, and percent saturation. The factor structures generally reveal the following characteristic pattern: (1) an oxygen-status factor, represented by high loadings on temperature, DO, and BOD; (2) an appearance factor based on turbidity, color, and discharge; and (3) a third variable factor, loading occasionally on percent saturation. The oxygen-status factor tends to be the component of greatest statistical importance. Bacteria, hardness, pH, and alkalinity generally exhibit the lowest loadings of any of the 11 variables. Indeed, bacteria is the least related to any of the other variables in the data set. The cumulative degree of explanation of the rotated factors declined during the decade, suggesting an increase in independence developing among the variables. It is hypothesized that urbanization with its associated changes in land use and runoff patterns might be intervening in the natural ecology of the stream. The effects of urbanization, then, would be to interfere with in-stream interactions among the variables. The 30 factor structures were quantitatively compared by using a computer program called RELATE. The procedure was to compare structures based on identical sets of variables from year to year for the same station and from basin to basin for the same year. The results for the Raritan River watershed indicate that intrabasin and interbasin similarities outweigh the differences and that the factor structures evidence a high degree of stability during the decade of the 1960's. WATER POLLUTION,
Robert S. Kerr Water Research Center, Ada, Okla.
W. C. Galegar.
In: Environmental Aspects of Geology and Engineering in Oklahoma; Proceedings of a Symposium of the Oklahoma Academy of Science, December 4, 1970, Stillwater: Annals of the Oklahoma Academy of Science, No 2, p 9-14, 1971. 2 ref.

Descriptors: *Water pollution control, *Oklahoma, Federal Water Pollution Control Act, Grants, Research and development, Corrosion, Fishkills, Thermal pollution, Treatment facilities.

In Oklahoma, the use of waters for industrial and municipal purposes has brought many problems. Among these are thermal stratification in lakes. Stratification in Keystone Reservoir caused oxygen-deficient zones that resulted in excessive corrosion as well as fish kills. Extremely high concentrations of minerals in Foss Reservoir are a result of both severe drought conditions in the impoundment area and a high evaporation rate. Other problems are pollution from industries, resulting in adverse conditions for aquatic life, and pollution by municipal wastes. The Environmental Protection Agency's most important contribution for clean water is a program of grants to municipalities for the purpose of providing adequate waste-treatment facilities. Also important are a research program to determine improved and more economical methods for controlling and treating wastes, and personnel assistance to various State and local agencies. (Knapp-USGS)

NATURAL CHLORIDE POLLUTION, ARKANSAS AND RED RIVER BASINS,
Army Engineer District, Tulsa, Okla.
M. W. DeGeer.
In: Environmental Aspects of Geology and Engineering in Oklahoma; Proceedings of a Symposium of the Oklahoma Academy of Science, December 4, 1970, Stillwater: Annals of the Oklahoma Academy of Science, No 2, p 42-46, 1971.

Descriptors: *Water pollution control, *Brines, Texas, Oklahoma, Salts, *Chlorides, Saline water.
Identifiers: *Arkansas River basin, *Red River basin.

Natural chloride pollution occurs in the Arkansas and Red River basins. A control program has the objective of making the waters of these basins usable at points of need. Two salt source areas were chosen for supplemental field studies including exploration and experimental test facilities. Work at the first area, the Great Salt Plains, provided detailed information on the general geology,

source of the pollution, and nature of the brine emission. Experimental work includes testing the impoundment of freshwater over saline soils. Remote sensing was used in crop and groundwater studies. For the second area, on Jonah Creek in Childress County, Texas, plans call for a subsurface collection system, deep-well injection, evaporation-rate studies, preinjection treatment of brines, and seismic monitoring for earthquakes. A FOUL TIDE,
R. Burton.
Sea Frontier, Vol 18, p 238-246, July 1972. 1 map, 5 photo.

Descriptors: *Oil wastes, *Water pollution sources, *Sewage effluents, *Aesthetics, Eutrophication, *Fish kill, Fouling, Agricultural chemicals, Industrial wastes, Phenols, Oxygen sag, Stagnant water, Water pollution effects, Toxicity, Waste water treatment, Economic aspects, *Water pollution control, Water quality, Wastes, Biodegradation, Ships.
Identifiers: *Rhine River.

Water pollution sources in densely populated areas of the world are discussed. Stagnant waters such as ditches, canals, and lakes can become grossly polluted by indiscriminate waste disposal. Even rivers can become so polluted that oxygen levels fall below that needed to sustain life. The Rhine is believed to contain as much oil pollution as was caused by the Torrey Canyon disaster. Not only is waste oil discharged into the Rhine, but large quantities of sewage enter the river each day. Rotterdam and the Haque obtain drinking water from the Rhine, and have found it necessary to construct reservoirs which trap water during the less polluted winter. The polluted Rhine water, after entering the North Sea, mixes with coastal waters dangerously close to fish nursery grounds. Chemical pollution in the Rhine has already destroyed a million dollar fishery for the Tubifex worm (aquarium food). The first major prosecutions for Rhine pollution concerned the release of 8,650 tons of caustic soda waste. Professor Korringa of the Netherlands Institute made several recommendations for curbing pollution in the Rhine: (1) treating seawage before discharge into coastal waters, (2) severe penalties for oil polluters, (3) the incineration of persistent chemicals and pesticides, (4) replacement of mercury, and (5) inoffensive dumping in areas with strong currents. ADD SALT TO TASTE,
Habitat, Inc., Belmont, Mass.
H. H. McConnell, and J. Lewis.
Environment, Vol 14, p 38-44, November 1972. 3 photo, 37 ref.

Descriptors: *Sodium chloride, *Deicers, *Snow removal, Lakes, Rivers, Wildlife, Vegetation, Solubility, Dispersion, Percolation, Leaching, Water quality, Water pollution sources, Potable water, Porosity, Soil physical properties, Eutrophication, Drainage, Calcium chloride.

Nine million tons of salt were used in 1970 to clean snow from highways. These quantities of salt have adverse effects on public drinking water supplies, wildlife, vegetation, lakes, and rivers. A mixture of calcium chloride and sodium chloride lowers the freezing point of the brine solution and breaks the bond between ice and road. The danger is that high concentrations of salts may overload dispersal mechanisms. It is estimated that 25 to 50 per cent of the salt infiltrates to the groundwater. High runoff contaminates many shallow wells and can also affect wildlife by disturbing body processes. Salt in water supplies may be harmful to people with heart disease or those on low salt diets. Saline soil water will inhibit the plants intake of water and make soil less permeable. Substantial losses of roadside trees have occurred. Salt may also disrupt the vertical mixing in lakes and ponds through density stratification and degrade fish environments. (Sperling-Florida)

A DOUBLE MARINE DISASTER,
A. J. Nathan.
Sea Frontiers, Vol. 18, No. 4, p. 202-209, July-August 1972. 7 photo.

Descriptors: *Water pollution, Oil, Environment, *Environmental effects, Ships, Breeding, *Oil spills, Oil pollution, Ecology, Aquatic habitats, Shoals, Coasts, Fish, Food chain, Birds, Shore birds.
Identifiers: *South Africa(Cape Agulhas), *Penguins.

The 1971 sinking of the Wafra, a Liberian registered, American owned oil tanker threatened to be the worst disaster of its kind since the wreck of the Torrey Canyon. Running aground at Cape Agulhas, the tanker posed a threat to the nearby Dyer Islands, principal breeding grounds of the black-footed penguin. Already a diminishing species, the penguins are important to the ecology of the sea since they deposit their excreta (guano) into the water, which produces nitrogen for the phytoplankton upon which small fish feed. Shoals of pilchard then develop, which are in turn eaten by birds, humans and larger fish. It is important therefore that the shoals are sufficiently large to maintain the ecological cycle. A marine court of inquiry, while absolving the parties of blame for the incident, noted that if a deep-sea salvage tug had been available when the Wafra first encountered difficulty, the pollution probably could have been avoided. UNDERGROUND NUCLEAR TESTING PROGRAM, NEVADA TEST SITE (FINAL ENVIRONMENTAL IMPACT STATEMENT).
Division of Environmental Affairs (AEC), Washington, D.C.
Available from National Technical Information Service, Springfield, Va, 22151, as EIS-NV-73-0798-F, for $9.00 paper copy, $1.45 microfiche. April 1973. 121 p, 4 fig, 1 map, 1 photo, 3 append.

Descriptors: *Environmental effects, *Nuclear explosions, Craters, *Underground, *Water pollution sources, Radioactive wastes, Ecosystems, Plant growth, Terrestrial habitats, *Nevada, Federal government, Research priorities, Fresh water.
Identifiers: *Environmental Impact Statements, *Northern Yucca Flat(Nev).

No significant adverse effects on the environment are anticipated as a result of the Atomic Energy Commission's underground nuclear testing program. The probable impact on the environment due to continued underground nuclear testing at the site will be small. A large amount of radioactive matter will be created in the underground cavities formed by the nuclear detonations. The terrestrial ecosystem will be affected by testing due to the creation of new subsidence craters. There is a slight chance of localized onsite effects to plant life. Local freshwater systems will not be significantly affected by additional radioactivity derived from execution of the proposed test program. Slight adverse environmental effects cannot be avoided. (Daniels-Florida)

PAPER'S POLLUTION PROBLEMS,
H. V. L. Bloomfield.
American Forests, Vol 77, p 10-13, 41-43, November 1971. 3 photo, 3 chart.

Descriptors: *Pulp wastes, *Wood wastes, *Paper industry, *Pulp and paper industry, Chemical wastes, Organic wastes, Water pollution sources, Waste water treatment, Water reuse, Environmental sanitation, Costs, Economic feasibility, Financial feasibility, Industries, Biological treatment, Water pollution treatment, Recycling, Odor, Air pollution.

The total waste load originating from the paper industry represents twenty-seven percent of the total pollutional load from manufacturing. Per capita paper and paperboard consumption is five hundred and seventy-three pounds per year. Paper industries lead all other industries on expenditure for pollution. By 1969 eighty percent of the facilities had some kind of waste water facility. Mills responsible for forty-one percent of the total output gave their wastewater secondary treatment. However ten percent of the mills now in operation can never meet any anti-pollution standards. The wastes of the pulp and paper industry, except for odor, are biodegradable. The industry's pollution comes from dumping too much of these harmless materials, too much for nature to handle. Extensive re-cycling has been proposed, but its chief value seems to be in anti-littering. About twenty percent of paper output is recycled, but the flushing out of the inks and coatings adds to paper mill pollutions. So far there is no known way to get rid of the pulping odor. As little as one to twenty parts per billion of air can be detected. Systems that make progress toward ending this pollution are prohibitively expensive. (Sperling-Florida)

THE MIXING CHARACTERISTICS OF SUBMERGED MULTIPLE-PORT DIFFUSERS FOR HEATED EFFLUENTS IN OPEN CHANNEL FLOW,
Iowa Univ., Iowa City. Dept. of Mechanics and Hydraulics.
J. R. Argue.
Available from the National Technical Information Service as PB-230 243 $10.00 in paper copy, $1.45 in microfiche. M Sc Thesis, May 1973. 124 p, 26 fig, 16 tab, 32 ref, 3 append. OWRR A-040-IA (1).

Descriptors: *Jets, *Mixing, *Diffusion, *Dispersion, Heated water, *Thermal pollution, Hydraulic models, *Path pollutants, Waste water(Pollution), Stratified flow, Outlets, *Open channel flow.

The behavior of heated water jets discharging into a shallow, co-flowing environment was studied in a model which simulated the flow of cooling water from a prototype multiport diffuser discharging into a river or ocean current. The relative effect of jet interaction and surface distortion were considered. The port spacing distance was the most significant variable. Criteria for differentiating among well-mixed flows, moderately well-mixed flows and stratified flows were determined together with the relationship between mixing and distance. A procedure for designing multiport diffuser installations is suggested. (See also W74-05822) (Knapp-USGS)

. J. Schiller.
vailable from the National Technical Informaon Service as PB-230 212 $11.50 in paper copy, 1.45 in microfiche. Ph D Thesis, July 1973. 146 p, l fig, 5 tab, 30 ref, 2 append. OWRR A-040-IA ').

escriptors: *Thermal pollution, *Mixing, Heated water, Hydraulic models, Mathematical iodels, Path of pollutants, Turbulent flow, Turbunce, Stratified flow, Water temperature, Disperon, Diffusion, Computer programs, *Open chanel flow.

method for prediction of vertical mixing of eated surface effluents in the far-field mixing reon was studied using laboratory flume experients which covered a range of flows from well ixed to nearly stable stratified conditions. The elocity and depth of flow, as well as the temperare difference and discharge ratio between amient and effluent flows were varied to simulate ie range of conditions commonly encountered. emperatures were recorded downstream by moile thermistors. Velocity measurements were also ken for selected runs. From the data together ith an analysis based on the convection-diffusion quation, it is possible to determine (1) the istance for nearly complete mixing, (2) a bulk ixing coefficient for moderately and rapidly mixg flow and (3) the vertical distribution of the verall vertical heat transfer coefficient at cross ctions downstream. The buoyancy effects were sorbed into the transfer coefficient. The less ense water inhibits mixing near the surface, and eates reduction in mixing throughout most of the epth for the more stratified flows. For the rapidly ixing flows, the vertical heat transfer coefficient greed closely with the turbulent momentum ansfer coefficient. Predictions of the ownstream temperature profiles were obtained sing a finite difference representation of the eady state convection-diffusion equation. The redicted profiles agreed closely with the experiental ones. (See also W74-05821) (Knapp-USGS) 74-05822

HREE-DIMENSIONAL TURBULENT DIFFUION FROM POINT SOURCES OF THERMAL OLLUTION IN A RECTANGULAR OPEN HANNEL,
elaware Univ., Newark. Dept. of Chemical Enneering.
. C. Prieve.
vailable from the National Technical Informaon Service as PB-230 220 $18.50 in paper copy, .45 in microfiche. Master of Chemical Engineerg Thesis, May 1973. 293 p, 35 fig, 18 tab, 69 ref, 9 pend. OWRR A-015-DEL (2).

escriptors: *Heat transfer, *Path of pollutants, ixing, *Dispersion, *Diffusion, Turbulent flow, hermal pollution, Convection, Mass transfer, pen channel flow.

me simple forms of turbulent constitutive relans, which have been useful in pipe flows, are plied to the case of turbulent flow in a rectangur open channel. Procedures are given for extractg the constitutive parameters from the measured locity or temperature field. Thermal profiles sulting from a concentrated source of heat cated well away from the boundaries may be scribed by assuming a direct proportionality tween the turbulent energy flux and the timeeraged thermal gradient. The proportionality nstant, or eddy conductivity, must be allowed to sume a different value for each of the three ergy flux components, but variations with posin may be ignored. Incorporating this constitue equation with the energy equation, and glecting axial diffusion, the product of eddy nductivity and distance from the source is uniquely and predictably related to the variance of the time-averaged temperature profile along an axis appropriate to that conductivity component. This allows the determination of both cross-sectional components of the apparent eddy conductivity, using the minimum number of local temperature measurements necessary to establish both variances. Comparison of the momentum diffusivity with the thermal diffusivities reveals these two quantities to be of nearly the same magnitude. (Knapp-USGS)

HYDRAULICS AND THERMAL DISPERSION IN AN IRREGULAR ESTUARY,
General Electric Co., Philadelphia, Pa. Re-Entry and Environmental Systems Div.
R. R. Boericke, and D. W. Hall.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 100, No HY1, Paper 10282, p 85-102, January 1974. 11 fig, 10 ref, append.

Descriptors: *Dispersion, *Path of pollutants, *Estuaries, *Thermal pollution, Mixing, Tides, Tidal waters, Thermal powerplants, Water temperature, *Mathematical models, Diffusion, Finite element analysis, Open channel flow, Model studies.

A model of thermal pollution in an irregular estuary is based on the open-channel hydraulics equations in two dimensions. Coordinate transformation is used to map the irregular shoreline into a rectangular computational space, thereby simplifying treatment of boundary conditions. The hydraulic flow field is calculated separately from the temperature field, due to the large difference in stable step size for the two calculations. The results of the hydraulics calculation, which become periodic after about one and one-half tidal cycles, are stored on magnetic tape for use in the temperature calculation. The temperature field arising from a powerplant thermal discharge requires 15 or more tidal cycles to become periodic, due to the gradual diffusion of heat away from the outfall by oscillating tidal currents. Sample temperature calculations are presented which illustrate the effect of the oscillatory tidal flow on the temperature distribution near the outfall. (Knapp-USGS)
W74-05828

LONGITUDINAL DISPERSION IN SATURATED POROUS MEDIA,
California Univ., Davis. Dept. of Water Science and Engineering.
M. A. Marino.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 100, No HY1, Paper 10296, p 151-157, January 1974. 3 fig, 5 ref, append.

Descriptors: *Path of pollutants, *Groundwater movement, *Dispersion, *Porous media, Equations, Saturated flow, Equations, Water pollution sources, Seepage.

Analytical solutions were developed for two problems of longitudinal dispersion within semi-infinite, nonadsorbing, homogeneous, isotropic media in unidirectional flow fields. The source concentrations consist of variable inputs of contaminants. The solutions predict the distribution of contaminants resulting from the variable source concentrations. Two numerical examples are presented. (Knapp-USGS)
W74-05832

DIFFUSION AND DISPERSION IN OPEN CHANNEL FLOW,
Pennsylvania State Univ., University Park. Dept. of Civil Engineering.
A. C. Miller, and E. V. Richardson.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 100, No HY1, Paper 10298, p 159-171, January 1974. 8 fig, 2 tab, 13 ref, append.

Descriptors: *Diffusion, *Dispersion, *Open channel flow, *Path of pollutants, Mixing, Turbulence, Flow resistance.

The relationships of lateral turbulent diffusion and longitudinal dispersion coefficients to the parameters that make up the structures of flows were studied experimentally. The resistance to flow for these runs varied from 10.6 to 4.4. The relation for the lateral turbulent diffusion coefficient was not affected by the secondary circulation that was present in all of the flows and is the same as that for a large range of flow conditions. The dispersion coefficient varied with resistance to flow and the average velocity. Longitudinal diffusion, which depends on the turbulence of the flow, was an insignificant factor in the dispersion coefficient as compared to the distribution of the local mean velocity in the lateral and vertical direction. (Knapp-USGS)
W74-05833

NORFOLK HARBOR DISPOSAL STUDY: HYDROGEOLOGIC STUDY OF NANSEMOND CITY DISPOSAL AREA.
Army Engineer District, Norfolk, Va.
April 1973. 10 p, 3 fig, 13 ref, 3 append.

Descriptors: *Hydrogeology, *Atlantic coastal plain, *Virginia, *Spoil banks, *Dredging, Water pollution control, Harbors, Groundwater.
Identifiers: Nansemond(Va), *Norfolk Harbor(Va).

The Craney Island Disposal Area established in 1953 to contain Norfolk Harbor dredge spoil will be filled to capacity within 10 years. At that time an additional spoil area will be needed for disposal of dredge spoil from maintenance dredging of Norfolk Harbor. Current environmental standards prohibit the disposal of contaminated dredge spoil in open waters. Consequently, the Norfolk District is studying viable disposal alternatives including disposal on low-lying ground in Nansemond City. The feasibility of using the Nansemond City Disposal Area was studied by defining the hydrogeology of the area. The study is also required to provide engineering data needed for design of pollution control measures, if required, to maintain the freshwater environment. The study area is located on the Atlantic Coastal Plain, a gently seaward sloping lowland characterized by a series of lowland flats and scarps that rise westward from the sea. The Coastal Plain is underlain by a series of unconsolidated sands and clays which range from Cretaceous to Recent. These sediments vary considerably in character over wide areas. They are usually covered by a few feet of peat. Many small lenses of sand function as shallow groundwater aquifers and domestic water supply for the surrounding area. These Pleistocene sediments, from 25 to 50-feet thick, are underlain by 150 to 200 feet of late Miocene, Yorktown Formation, shallow marine sediments. These sediments contain beds of silt and clay which are very low in permeability and function as confining beds for the Pleistocene aquifers above. (Knapp-USGS)

THE SPREADING AND TRANSPORT OF OIL SLICKS ON THE OPEN OCEAN IN THE PRESENCE OF WIND, WAVES, AND CURRENTS,
Avco Corp., Wilmington, Mass. Avco Space Systems Div.
G. A. Waldman, R. A. Johnson, and P. L. Smith.
Available from NTIS as AD-765 926, $3.75 paper copy, $1.45 microfiche. Final Report No AVSD-0068-73-RR, July 1973. 70 p, 25 fig, 5 tab, 33 ref. DOT-CG-20, 617-A.

Descriptors: *Oil spills, *Oil pollution, Dye releases, Turbulence, Models, Winds, Waves(Water), Currents(Water), Ocean waves, Ocean currents, *Pollutants.
Identifiers: Spreading, Oil slick transport, Pollutant transport.

Calculations have been made of the spreading and transport of oil slicks on the open ocean. New and available results have been used for the spreading of oil on calm waters, and Okubo's correlation of dye-release experimental data has been invoked for the spreading caused by water turbulence. In the presence of combined effects of spreading and transport by various environmental influences, a simple superposition model has been employed. Limited comparisons of the results of these calculations have been made with data from the San Clemente and Arrow spills, and the Chevron and Santa Barbara leaks. Insufficient data on winds, waves, and currents and lack of knowledge of the rates of dispersion caused by surface turbulence and the evaporation of volatile components, as well as the limitations of the present analytical models regarding coupled spreading and transport effects, preclude making definitive calculations and comparisons. Presently available analytical and experimental results can be applied to predict oil slick spreading and transport under many conditions, but further work is needed to more precisely define the limits of validity of these methods. W74-05919

BREAKDOWN OF BENZO(A) PYRENE BY MICROORGANISMS IN WASTE WATERS, (IN RUSSIAN),
Akademiya Nauk SSSR, Moscow. Institut Mikrobiologii.
M. N. Poglazova, A. Ya., Khesin, G. E. Fedoseeva, M. N. Meisel', and L. M. Shabad.
Dokl Akad Nauk SSSR SER Biol. Vol 204, No 1, p 222-225. 1972.
Identifiers: Microorganisms, *Pyrenes, Waste waters, Water pollution sources, *Industrial wastes, *Aromatic hydrocarbons, *Degradation(Decomposition).

The microflora of industrial waste polluted with polycyclic aromatic hydrocarbons (PAH), including benzo(a)pyrene, can break down large quantities of these hydrocarbons. Consequently, aromatic compounds are constantly being naturally decomposed in waste waters. The breakdown of PAH by microflora of waste waters can apparently be intensified by adding cultures of microorganisms actively oxidizing PAH.--Copyright 1973, Biological Abstracts, Inc.

5C. Effects Of Pollution

AN INVESTIGATION OF THE EFFECTS OF DDT AND OTHER CHLORINATED HYDROCARBONS ON THE GROWTH OF EURYHALINE MICROALGAE,
Maine Univ., Orono. Dept. of Botany; Maine Univ., Orono. Dept. of Oceanography; and Maine Univ., Orono. Dept. of Zoology.
R. L. Vadas.
Available from the National Technical Information Service as PB-229 680, $5.75 in paper copy, $1.45 in microfiche. Completion Report, June 1972. 48 p, 17 fig, 2 tab, 5 ref. OWRR A-021-ME(1).

Descriptors: *DDT, *Chlorinated hydrocarbon pesticides, Algae, *Dieldrin, Water pollution effects, Growth rates, Inhibition, Cytological studies.
Identifiers: *Euryhaline microalgae, *Porphyridium sp., *Platymonas subcordiformis, *Brachiomonas submarina.

This research project was initiated to determine the effects of chlorinated hydrocarbons at various concentrations on the growth of euryhaline microalgae, to determine if resistance to DDT occurs in algae with short generation times and with wide tolerances to naturally occurring environmental conditions, and to determine photosynthetic rates for algae treated with chlorinated hydrocarbons. Extensive studies on the effects of DDT on the growth of Platymonas subcordiformis indicate that some degree of resistance occurs naturally in the alga and that depressions in the carrying capacities and in growth rates, especially, in the form of lags, are common at sublethal levels. Growth rates were adversely affected by DDT concentrations at 100 to 200 ppb. At 500 ppb cells never recovered within the experimental period (7 to 10 days). Studies on the effects of DDT at varying salinity levels suggest that cells are less resistant to DDT at higher salinities (22 to 30 PPT). Other eurytolerant microalgae treated with an initial dose of DDT include Porphyridium sp. and Brachiomonas submarina. Both species were more presistant to DDT than P. subcordiformis. B. submarina was not affected by 500 ppb DDT. Porphyridium sp. was unaffected by DDT concentrations of 10,000 ppb. Both log cells of P. subcordiformis and Porphyridium sp. were tested with dieldrin in one-shot treatments. 100 ppb and 10,000 ppb did not inhibit these cells. Daily additions of DDT were tested on P. subcordiformis. DDT added at the beginning of either the light or dark cycle was inhibitory and reduced growth rates at 25 to 50 ppb. Experiments are currently in progress to determine the effect of the diurnal growth rhythm on the sensitivity of cells of P. subcordiformis to DDT.

OCCURRENCE, RADIOACTIVITY, AND DIVERSITY, OF WINNIPEG RIVER BENTHIC ORGANISMS IN THE VICINITY OF WHITESHELL NUCLEAR RESEARCH ESTABLISHMENT,
Atomic Energy of Canada Ltd., Pinawa (Manitoba). Whiteshell Nuclear Research Establishment.
R. E. Ireland, J. E. Guthrie, and A. G. Robinson.
Available from NTIS, Springfield, Va., as Re AECL-4421, $5.45 per copy, $1.45 microfiche. I port No. AECL-4421, July 1973. 108 p, 10 fig, tab, 4 append.

Descriptors: *Nuclear powerplan *Radioactivity, Effluents, *Canada, Surve Assay, Benthos, Insects, Aquatic insects, Wa pollution, Biota, Aquatic life, Water quality.
Identifiers: *Winnipeg River.

The abundance and total beta activity of benthic insects in the Winnipeg River adjacent the Whiteshell Nuclear Research Establishm (WNRE) were determined during 1966 and 19 During the study, potential indicator species w identified and a number of aquatic insect speci not previously reported in Manitoba, were c lected. Tubificid worms, Chironomidae larv and Hexagenia spp. naiads were the most ab dant species in the total of 20 benthic taxa c lected. The radioactivity concentration ra (total beta activity of organism/total beta acti of water) of these species was about 2; therefc any of them could serve as indicators of chang the level of radioactivities in the aquatic biota stream and downstream of the WNRE liquid fluent outfall. Benthic-community diversity dices developed from information theory are fi ing increasing application as a method of assess water quality. The range of individual diversity dices (d) was 2.45 to 2.94, suggesting that the s tion of the river beside WNRE is mesotrophic. T information will serve as a baseline with which compare any future changes in the benthic c munities of the river. (Houser-ORNL)

ASSESSMENT OF POTENTIAL RADIOOLO CAL HEALTH EFFECTS FROM RANDON NATURAL GAS,
Office of Radiation Programs, Washington, D.C
R. H. Johnson, Jr., D. E. Bernhardt, N. S. Nelso and H. W. Calley, Jr.
Available from NTIS, Springfield, Va., as R No. EPA-520/1-73-004. $5.45 per copy, $ microfiche. Report No. EPA-520/1-73-004, N 1973. 71 p, 3 fig, 15 tab, 75 ref.

Descriptors: Radium radioisotopes, Radioactiv Radioactivity effects, Public health, Populati Water pollution, Water pollution sources, Nat gas, Bioassay, Biology, Toxicity, Cost-ben analysis.
Identifiers: *Randon.

Natural gas contains varying amounts of rad 222 which becomes dispersed in homes when n ral gas is used in unvented appliances. Ra decays to alpha-emitting daughter products wh can contribute to lung cancer when inhaled deposited in the respiratory system. For average use of unvented kitchen ranges and spa heaters, the tracheobronchial dose equivalen individuals was estimated as 15 and 54 mrem respectively, or 2.73 million person-rems/yr to United States population. A review of exposu conditions, lung model parameters, dose con sion factors, and health effect factors indica this population dose equivalent could potenti lead to 15 deaths a year from lung cancer. T represents only 0.03 to 0.08 percent of normal l cancer mortality. Since control of radon level gas would cost over $100 million for each rec tion of one health effect, it was concluded th requirement for such controls would not be c effective on a national basis. (Houser-ORNL)

FINAL ENVIRONMENTAL STATEMENT RELATED TO THE PROPOSED CATAWBA NUCLEAR STATION, UNITS 1 AND 2, DUKE POWER COMPANY.
Directorate of Licensing (AEC), Washington, D.C.
Available from NTIS, Springfield, Va., as Rept. No. Docket 50414-56; $10.60 per copy, $1.45 microfiche. Rept. No. Docket 50413-56, Dec 1973. 385 p, 43 fig, 70 tab, 129 ref, 12 append.

Descriptors: *Nuclear powerplants, Effluents, Environmental effects, Administrative agencies, Comprehensive planning, *Sites, Geology, Investigations, Hydrology, Seismology, Climatology, Meteorology, Ecology, Radioactive wastes, Water pollution, Water pollution sources, Radioactive effects, Monitoring, Public health, Transportation, Beneficial use, Cost-benefit analysis, *South Carolina.
Identifiers: *Pressurized water reactors, *Lake Wylie(S.C.), *Environmental Impact Statements.

This final environmental statement was prepared in compliance with the National Environmental Policy Act and relates to the proposed issuance of construction permits for construction of the Catawba Nuclear Station, Units 1 and 2. The nuclear station is located on Lake Wylie, York County, South Carolina, and will employ two pressurized water reactors cooled by water through closed-cycle wet cooling towers with water from and discharged to Lake Wylie. Environmental impacts are assessed and after consideration of alternatives an environmental benefit-cost summary was compiled.ironmental factors considered include climate, hydrology (surface water and ground water), ecology including aquatic life, cooling-water supply and discharge, cooling towers, cooling lakes, spray ponds, radioactive chemical and sanitary wastes, amount of dissolved oxygen and toxic chemicals in effluent water. AEC will issue construction permits subject to conformity with certain stipulations regarding construction activities, surveys, and monitoring to prevent significant adverse environmental impact. (Houser-ORNL)
W74-05423

FINAL ENVIRONMENTAL STATEMENT RELATED TO OPERATION OF SAN ONOFRE NUCLEAR GENERATING STATION UNIT 1, SOUTHERN CALIFORNAI EDISON COMPANY AND THE SAN DIEGO GAS AND ELECTRIC COMPANY.
Directorate of Licensing (AEC), Washington, D.C.
Available from NTIS, Springfield, Va., as Rept. No. Docket 50206-237; $10.60 per copy, $1.45 per microfiche. Report No. Docket 50206-237, Oct 1973. 326 p, 28 fig, 41 tab, 180 ref, 7 append.

Descriptors: *Nuclear powerplants, Effluents, Environmental effects, Administrative agencies, *Comprehensive planning, *Sites, Geology, Investigations, Hydrology, Seismology, Climatology, Meteorology, Ecology, Radioactive wastes, Water pollution, Water pollution sources, Radioactive effects, Monitoring, Public health, Transportation, Beneficial use, Cost-benefit analysis, *California, Pacific Ocean.
Identifiers: *Environmental Impact Statements, *Pressurized water reactors, San Diego(Calif).

This final environmental statement was prepared in compliance with the National Environmental Policy Act and relates to the conversion of a provisional operating license into a full operating license for the San Onofre Nuclear Generation Station, Unit 1. The power station is located on the Pacific Coast in the State of California, County of San Diego. The unit employs a pressurized-wtor cooled by a once-through flow of water obtained from and discharged to the Pacific Ocean. Environmental impacts are assessed and after consideration of alternatives an environmental benefit-cost summary was compiled. Environmental factors considered include climate, hydrology (surface water and ground water), ecology including aquatic life, cooling-water supply and discharge, cooling towers, cooling lakes, spray ponds, radioactive chemical and sanitary wastes, amount of dissolved oxygen and toxic chemicals in effluent water. It was concluded to convert the provisional license to a full-term operating license subject to the following limitation: (1) Define a comprehensive environmental monitoring program; (2) provide analysis and implement a program of remedial action to eliminate detrimental effects found. (Houser-ORNL)

Descriptors: *Nuclear powerplants, Effluents, Environmental effects, Administrative agencies, *Comprehensive planning, *Sites, Geology, Investigations, Hydrology, Seismology, Climatology, Meteorology, Ecology, Radioactive wastes, Water pollution, Water pollution sources, Radioactive effects, Monitoring, Public health, Transportation, Beneficial use, Cost-benefit analysis, *Pennsylvania.
Identifiers: *Boiling water reactors, *Schuylkill River(Penn), *Perkiomen Creek(Penn), *Environmental Impact Statements.

This final environmental statement was prepared in compliance with the National Environmental Policy Act and relates to the proposed issuance of construction permits for the Limerick Generating Station, Units 1 and 2. The station is located on the Schuylkill River near Pottstown, Pennsylvania, and will employ two boiling water reactors cooled in two natural-draft cooling towers using water from Schuylkill River and Perkiomen Creek and discharged to the Schuylkill River. Environmental impacts are assessed and after consideration of alternatives an environmental benefit-cost summary was compiled. Environmental factors considered include climate, hydrology (surface water and ground water), ecology including aquatic life, cooling-water supply and discharge, cooling towers, cooling lakes, spray ponds, radioactive chemical and sanitary wastes, amount of dissolved oxygen and toxic chemicals in effluent water. AEC will issue construction permits subject to certain stipulated requirements during construction. (Houser-ORNL)
W74-05425

FINAL ENVIRONMENTAL STATEMENT RELATED TO OPERATION OF DRESDEN NUCLEAR POWER STATION, UNITS 2 AND 3, COMMONWEALTH EDISON COMPANY.
Directorate of Licensing (AEC), Washington, D.C.
Available from NTIS, Springfield, Va., as Report No. Docket 50237-416 and 50349-313; $10.60 per copy, $1.45 microfiche. Report No. Docket 50237-416 and 50349-313, Nov 1973. 432 p, 49 fig, 51 tab, 211 ref, 7 append.

Descriptors: *Illinois, *Nuclear powerplants, Effluents, Environmental effects, Administrative agencies, *Comprehensive planning, *Sites, Geology, Investigations, Hydrology, Sesimology, Climatology, Meteorology, Ecology, Radioactive wastes, Water pollution, Water pollution sources, Radioactive effects, Monitoring, Public health, Transportation, Beneficial use, Cost-benefit analysis.
Identifiers: *Boiling water reactors, Kankakee River(Ill), Deplaines River(Ill), *Environmental Impact Statements, *Illinois River(Ill).

This final environmental statement was prepared in compliance with the National Environmental Policy Act and relates to the proposed issuance of a full-term operating license for the Dresden Nuclear Power Station, Unit 2, and continuance of operating license for Unit 3. Environmental impacts are assessed and after consideration of alternatives an environmental benefit-cost summary was compiled. Environmental factors considered include climate, hydrology (surface water and ground water), ecology including aquatic life, cooling-water supply and discharge, cooling towers, cooling lakes, spray ponds, radioactive chemical and sanitary wastes, amount of dissolved oxygen and toxic chemicals in effluent water. It was concluded to issue a full-term operating license for Unit 2 and continue the operating license for Unit 3 subject to the following conditions: (1) complete modifications to radwaste systems, (2) complete technical specifications as required, (3) supply course of action to alleviate any harmful effects or evidence of irretrievable damage detected. (Houser-ORNL)
W74-05426

FINAL ENVIRONMENTAL STATEMENT RELATED TO THE HADDAM NECK (CONNECTICUT YANKEE) NUCLEAR POWER PLANT, CONNECTICUT YANKEE ATOMIC POWER COMPANY.
Directorate of Licensing (AEC), Washington, D.C.
Available from NTIS, Springfield, Va., as Report No. Docket 50213-228; $7.60 per copy, $1.45 microfiche. Report No. Docket 50213-228, Oct 1973. 324 p, 38 fig, 49 tab, 191 ref, 3 append.

Descriptors: *Connecticut, *Nuclear powerplants, Effluents, Environmental effects, Administrative agencies, *Comprehensive planning, *Sites, Geology, Investigations, Hydrology, Seismology, Climatology, Meteorology, Ecology, Radioactive wastes, Water pollution, Water pollution sources, Radioactive effects, Monitoring, Public health, Transportation, Beneficial use, Cost-benefit analysis, *Connecticut River.
Identifiers: Pressurized water reactors, Haddam Neck(Conn), *Environmental Impact Statements.

The proposed action for the Haddam Neck Nuclear Power Plant is a conversion of the provisional operating license to a full-term operating license. The site is on the east shore of the Connecticut River, about 22 miles south-southeast of Hartford and about 16 miles north of Long Island Sound. The reactor is a pressurized water type cooled by water from and returned to the Connecticut River. This final environmental statement was prepared in compliance with the National Environmental Policy Act and relates to the operation of the Haddam Neck Nuclear Power Plant. Environmental impacts are assessed and after consideration of alternatives an environmental benefit-cost summary was compiled. Environmental factors considered include climate, hydrology (surface water and ground water), ecology including aquatic life, cooling-water supply and discharge, cooling towers, cooling lakes, spray ponds, radioactive chemical and sanitary wastes, amount of dissolved oxygen and toxic chemicals in effluent water. The conclusion is to convert the provisional license to a full-term operating license subject to the following limitations: (1) continue studies to prevent fish entrainment on screens, (2) identify plant influences on algae, (3) determine Menhaden losses through the cooling system, (4) define and environmental monitoring program for assay of effects during operation. (Houser-ORNL)
W74-05427

FINAL ENVIRONMENTAL STATEMENT RELATED TO CONSTRUCTION OF GRAND GULF NUCLEAR STATION UNITS 1 AND 2, MISSISSIPPI POWER AND LIGHT COMPANY.
Directorate of Licensing (AEC), Washington, D.C.
Available from NTIS, Springfield, Va., as Report No. Docket No. 50416-42; $10.60 per copy, $1.45 microfiche. Report No. Docket 50416-42, Aug 1973. 478 p, 33 fig, 75 tab, 184 ref, 5 append.

Descriptors: *Mississippi River, *Nuclear powerplants, Effluents, *Environmental effects, Administrative agencies, *Comprehensive planning, *Sites, Geology, Investigations, Hydrology, Seismology, Climatology, Meteorology, Ecology, Radioactive wastes, Water pollution, Water pollution sources, Radioactive effects, Monitoring, Public health, Transportation, Beneficial use, Cost-benefit analysis, *Mississippi.
Identifiers: *Boiling water reactors, *Environmental Impact Statements.

The Grand Gulf Nuclear Power Station is located in Claiborne County, Mississippi, on the east bank of the Mississippi River approximately 25 miles south of Vicksburg. The station will employ two boiling water reactors. The turbine steam condensers will be cooled by water circulated through wet, natural-draft cooling towers with makeup and blowdown water taken from and discharged to the Mississippi River. This final environmental statement was prepared in compliance with the National Environmental Policy Act and relates to the proposed construction of the Grand Gulf Nuclear Station Units 1 and 2. Environmental impacts are assessed and after consideration of alternatives and environmental benefit-cost summary was compiled. Environmental factors considered include climate, hydrology (surface water and ground water), ecology including aquatic life, cooling-water supply and discharge, cooling towers, cooling lakes, spray ponds, radioactive chemical and sanitary wastes, amount of dissolved oxygen and toxic chemicals in effluent water. The conclusion is to issue a construction permit for the facility subject to the following conditions: (1) Implement monitoring programs for environmental effects; (2) control unnecessary impacts from construction; (3) study intake velocity of water; (4) provide information on entrainment and impingement of biota in the intake; (5) control the residual chlorine concentrations; (6 control gaseous radioactive effluents; and (7) control use of corrosion inhibitors. EXPERIMENTAL STUDY OF THE EFFECT OIL ON SOME REPRESENTATIVES BENTHOS IN THE CASPIAN SEA,
Akademiya Nauk Azerbaidzhanskoi SSR, Insti Zoologii.
A. G. Kasymov, and A. D. Aliev.
Water, Air, and Soil Pollution, Vol 2, No 2, p 2 245, June 1973. 11 fig, 3 ref.

Descriptors: *Benthic fauna, Water pollution fects, *Toxicity, *Bioassay, Weight, Grow rates, Evolution, Worms, Mollusks, Oligochaet *Oil.
Identifiers: *Crude oil, *Caspian Sea, Macroinv tebrates.

Experimental studies of the influence of crude on bottom fauna in the Caspian Sea were c ducted in crystallizators and aquariums. Oil c centrations varing from 0.2 to 4.0 mg/l were us with water temperature of 19.3 to 24.4 C and dil O2 varying from 4.5 to 7.0 mg/l. Worm oligochaetes, and mollusks were used in the periments. Under high concentrations of (higher than 3 to 5 mg/l) the animals initially not change weight and then lost weight a perished. In a weak solution of oil (below 1 mg/l speed up in normal evolution, growth, a reproduction took place in the animals. (Mortla Battelle)

)escriptors: *Hydrogen ion concentration, Cytological studies, *Temperature, Lipids, *Gas hromatography, Cultures, Aeration, Growth ıtes, Metabolism, Aerobic bacteria.
dentifiers: *Fatty acids, *Bacillus acidocaldarius, 'hemical composition, Methyl esters, 11-'yclohexylundecanoic acid, 13-Cyclohexyl-idecanoic acid, Anteiso-heptadecanoic acid, Iso-eptadecanoic acid, Thin layer chromatography, ample preparation.

'he fatty acid composition of lipid extracts from ells of Bacillus acidocaldarius grown at tempera-ıres of 50 to 70C and pH values of 2 to 5 was etermined by gas chromatography of the methyl sters. The most abundant fatty acids are 11-yclohexylundecanoic and 13-cyclohexyl-idecanoic, followed by anteiso- and iso-hep-adecanoic; unsaturated acids are absent. Highly erated cultures produce more of the iso and an-:iso acids and less of the cyclohexyl acids. The ffects of temperature and pH are interdependent; t lower pH, increasing temperature raises the pro-ortion of the iso and anteiso acids, but at higher H the effect of increasing temperature is :versed and the proportion of the cyclohexyl cids is increased. lalathion, under the vitro laboratory conditions, readily degraded by an Arthrobacter species to our metabolites - malathion half-ester, malathion icarboxylic acid, potassium dimethyl hosphorothioate, and potassium dimethyl hosphorodithioate. However, it is not clear hether or not this degradation represents a simul-ıneous detoxication of the malathion molecule. /ith this in mind, the relative toxicity of each of ıe four metabolites to bovine cetylcholinesterase was determined manometri-ally with the Warburg apparatus. Malathion half-ster retained roughly one-third the enzyme toxici-/ of unaltered malathion, while the other ıetabolites showed essentially no enzyme inhibi-on. It was concluded that while microbial conver-on of malathion to malathion half-ester may well represent complete malathion degradation, it does not constitute complete insecticide detoxication. Heterotrophic, mesophilic bacteria derived from, and maintained in, a freshwater environment where subjected to three classes of her, 2,4,5-trichlorophenoxyacetic acid, and paraquat, used as water soluble solutions, were added (0.7 and 1.4 mg/1) to a laboratory culture of bacteria. Total numbers of the bacteria, representing several genera, were monitored for alteration of numbers and types. Temperature, pH, and dissolved oxygen were monitored and the culture medium was tested for residual herbicide. Trichlorophenoxyacetic acid, 2,4, 4-T, did not affect that portion of the bacterial population tested. Increase of bacterial counts as the result of paraquat addition was real, with both direct and indirect effects. Diuron caused a reduction in the total bacterial counts and selective enrichment. The reasons for the observed differences are discussed. The herbicides remained qualitatively measurable for periods up to 3 weeks. (Holoman-Battelle)

Investigations were initiated to evaluates of sedimentation on the algal composition, primary productivity rates and chemical nutrient concentrations of a 17-acre recreational impoundment in central Virginia. Comparisons during the winter seasons of 1972-1973 indicated that as a result of sedimentation, from lake front home construction, the total numbers of algal genera in the lake decreased from 24 to 16, productivity as measured by C-1402 and total extractable chlorophyll decreased two-fold, and several important nutrients, i.e. NH4-N, Si02 and P04-P increased significantly. Identifiers: *Piscivores, Cichla ocellaris, *Panama Canal Zone(Gatun Lake), Malaria, Black terns, Kingfishers, Herons.

Probably in early 1967, a piscivore from South America, Cichla ocellaris, was introduced to Gatun Lake in the Panama Canal Zone. As this predator population spread through the lake, the initial effect was dramatic reductions in almost secondary consumers. These species reductions produced, in turn, second- and third-order changes at other trophic levels of the ecosystem. The resulting changes in the lake community can be seen best by examining the general Gatun Lake food wed. The decrease in numbers of the important planktivore Melaniris has resuld in changes within the zooplankton community, as illustrated by the cladoceran Ceriodaphnia. The tertiary-consumer populations, such as tarpon, black terns, kingfishers, and herons, formerly dependent on small fishes for food, appear less frequently in the Cichla areas of the lake. There has also been, possibly, a resurgence of the local mosquito populations (which are malaria vectors), caused by the reduction in the populations of insect-eating fishes. Even the primary producers may be affected by this introduction. Although at present the Gatun Lake ecosystem is undergoing rapid changes, we anticipate an eventual return to some form of equilibrium. However, it will be some time before one can evaluate the permanence or transience of the many changes produced in the trophic levels by the introduction of a single, toplevel predator to this lake system. Descriptors: *Water temperature, *Thermal stress, *Marine algae, *Plant physiology, Growth rates, Reproduction, Amino acids, Lipids, Marine plants, Sea water, Waves(Water), Currents(Water), Metabolism, Cultures, Germination, Nitrogen, Chlorophyta, Plant growth, Lethal limit
Identifiers: *Ulva fasciata, Biosynthesis, Mediterranean Sea, Sporophytes, Gametophytes, Plant metabolism.

This work deals with the effect of temperature variations on growth, reproduction, amino acid synthesis, fat and sugar content in Ulva fasciata inhabiting the littoral region of the Mediterranean shore bordering Alexandria. Higher temperatures above 30C have lethal effects on some parts of the algal fronds while the other are rather resistant. The latter are scattered groups of cells, which usually regenerate new plants when carried even to distant parts due to detrimental action of waves and currents. They serve a good means for vegetative propagation and spread better than zooids, which probably perish under such severe and violent conditions. The rate of growth of Ulva indicated by the increase in dry weight and total nitrogen, increases at rising temperature till the latter becomes limiting. Higher temperatures favour the growth and development of sporophytic phases, known by their deep green colouration, while temperatures below 20C favour the production of gametophytes, identified by their yellowish green colour. This might explain why most of the algal crops of Ulva fasciata produced from parental stock (3 crops per year i.e. annually), are sporophytes. Moderate temperatures were favourable for growth, reproduction and the various metabolic processes. Amino acids and sugar contents increase with the rise of temperature, reaching their maximum around 25C, while fat content increases at still lower temperatures. (Mortland-Battelle)

OCCURRENCE OF THE PARASITIC BRANCHIURAN, ARGULUS ALOSAE, ON DYING ATLANTIC MENHADEN, BREVOORTIA TYRANNUS, IN THE CONNECTICUT RIVER,
National Marine Fisheries Service, Beaufort, N.C. Atlantic Coastal Fisheries Center.
R. L. Kroger, and J. F. Guthrie.
Trans Am Fish Soc. Vol 101, No 3, p 559-560, 1972.
Identifiers: Argulus-alosae, *Atlantic menhaden infection, *Branchiuran parasite, Brevoortia-tyrannus, *Connecticut River, Dace, Economics, Exhaustion, Rivers, Roach, *Fish parasites, Fish mortality, *Fish diseases.

Dying adult Atlantic menhaden B. tyrannus infested with parasitic branchiuran A. alosae were collected from the Connecticut River at Old Saybrook, Connecticut. Examination of 50 dying menhaden (average 300 mm fork length) showed that each was heavily infested with argulid fish lice. A. alosae is probably of economic importance since heavy infestations of other fish lice species have destroyed entire fish populations in confined environments such as pools and lakes. The abnormal behavior of adult menhaden may have resulted from irritation caused by A. alosae. Menhaden, like roach and dace, may be hypersensitive to attacks by fish lice, and physical exhaustion resulting from parasite irritation caused the mortality of menhaden in the river.--Copyright 1973, Biological Abstracts, Inc.

A STUDY OF WATER-SOLUBLE INHIBITORY COMPOUNDS (ALGICIDES) PRODUCED BY FRESH-WATER ALGAE,
Kentucky Water Resources Inst., Lexington.
D. O. Harris, and M. C. Parek.
Available from the National Technical Information Service as PB-229 831; $4.75 in paper copy, $1.45 in microfiche. Research Report No. 69, November 1973. 34 p, 10 tab, 13 ref. OWRR A-018-KY(6). 14-01-0001-1085, 14-01-0001-1636, 14-31-0001-3017, and 14-31-0001-3217.

Descriptors: Algal toxins, Aquatic algae, Algal poisoning, *Aquatic weed control, *Chlorophyta, Nuisance algae, Algal control, Scum, Water pollution effects, *Algicides, *Inhibitors, *Plant growth regulators.
Identifiers: *Pandorina morum, *Volvox tertius, Staphylococcus aureus.

A complex system of growth inhibitors was observed in the green algae (Volvocaceae). Inhibitors were found in the culture filtrates of some genera which limit their own growth (auto-inhibitors) while others in the family produce substances which check the growth of other genera (heteroinhibitors). These inhibitors were destroyed by autoclaving. It was decided that Pandorina morum, which produced the strongest inhibitor and Volvox tertius, the most sensitive to the inhibitor would make an excellent model system for a study of the chemical and physical properties of these naturally occurring algicides. The algicide could be removed from actively growing cultures about the 12th day after inoculation and maximum inhibition was recorded for the next 18 days. The substance could be diluted several times with the retention of at least partial activity. The inhibitor was relatively stable to high temperatures, moved slowly through a dialysis membrane and possessed anti-bacterial properties in that it inhibited the growth of Staphylococcus aureus. The material was relatively stable when exposed to acid, although exposure to a pH of 2.0 for 30 minutes did destroy most of the activity. The substance was soluble in benzene and chloroform. All attempts to degrade or destroy the inhibitor with the common proteolytic enzymes (trypsin, chymotrypsin and pronase) proved unsuccessful, suggesting the substace is not proteinaceous in nature. In experiments with G-25 and G-50 Sephadex, the inhibitor was retained on the column, indicating a molecular weight of less than 5000. (Grieves-Kentucky)

River(Fla).

The Cocohatchee River in southern Florida is
extremely productive river which has be
threatened by dredge and fill activities. The rive
productivity is due to a delicate and comp
balance of several factors, including the quant
and quality of the water, the hydro period, and t
mangroves which line its banks. Historically, t
Cocohatchee was a meandering creek, which p
mitted water from the interior to slowly flow do
the river. During dry spells, fresh water continu
to enter the river from the upland slough. T
system was one of gradual change, encouragin
steady state of high productivity. Channelizati
in the last decade has had varied effects upon t
river's ecosystem. First, it has reduced the hyc
period, or the period of fresh water flow from t
interior. This has changed the steady system
brackish water to one of sudden, extreme chan
of fresh and salt water, reducing the rive
productivity since many of the organisms can
tolerate such extreme changes. Channelizati
also caused the removal of many mangrov
which provide the base for the river's food cha
and destroyed the roots of the mangroves wh
had previously reduced siltation. (Ritchie-Florid

ESCUING THE OCEANS, THE NEED FOR IMEDIATE ACTION,
Y. Cousteau.
ırrent, p 36-39, December 1971.

scriptors: *Oceans, *Water pollution sources, Vater pollution effects, *Ocean water, ommercial fishing, Wildlife conservation, efs, Aquatic animals, Competition, Economics, ices, Indirect costs, Economic efficiency, ıemical wastes, Pesticide residues, Public alth, Social costs, Aesthetics, Environment, Enonmental effects, Coral, Atolls.

e impending destruction of the ocean by pollun and other causes is discussed. Disappearance coral reefs is due in part to pollution, fishing, d manual destruction. Teams of Tahitian divers stroy ten kilometers of reef a week for shells at are sent to museums and shops around the rld. In the past people though the oceans so imnse that no harm could be done to it. Air, land, d water pollution are usually discussed as parate entities, but all will end up in the ocean. ready, twenty-five percent of all DDT comunds so far produced are in the ocean. Another ason for the deterioration of the ocean is overhing. Improved catches in recent years have en due to improved fishing methods, but this ar the catch declined. A 1960 study indicated it in eighty years more than eight hundred spes had been exterminated by man. Overpopulan and unrestricted competition are the main sons for the planet's destruction. Remedies ggested are: (1) intensification of research and ucation of the public; (2) adding the cost of aning the environment to product cost; and (3) ernational cooperation. (Sperling-Florida)

STRIP MINING: PARTNERSHIP IN GREED,
H. M. Caudill.
American Forests, Vol 79, p 16-19, May 1973. 1 tab, 1 photo.

Descriptors: *Strip mines, *Coal mines, *Strip mine wastes, *Land reclamation, *Industrial production, Economic impact, Strip mine lakes, Coal mine wastes, Water pollution sources, Social aspects, Percolation, Topsoil, Soil leaching, Acidic water, Industrial wastes, Mine acids, Aesthetics.

The effect of strip mining on the landscape is described. Companies that shred a hill or plain do so to satisfy insistence on cheap power and abundant industrial products. Water collects in the empty holes and sulfur, iron, and other minerals leach out of the cliff polluting the water. On two adjacent valleys in Kentucky scientific studies indicated that in the mined valley thirty-thousand tons of dirt per square mile washed out compared to twenty-seven tons in the valley still under its natural woodland cover. Flood control reservoirs for which the Army Corps of Engineers expended eighty-three million dollars, were choked with mine silt. Stripping had reduced their life expectancy to ten or fifteen years. One reservoir became sterile within three years after stripping first yellowed its water. There is a need for stern laws and a land ethic which places the preservation of the earth and its waters above comfort, prestige, affluence, and liberty of the people. (Sperling-Florida)

Identifiers: *Energy sources, Offshore plant sites, Skelly Wright/Calvert Cliffs decision.

The five major sources of energy in the United States, petroleum, natural gas, coal, hydro, and nuclear, are illustrated graphically. The only resource supplies which are available in sufficient abundance to meet future energy needs are coal and fissionable material, and given new technology, the sun and the sea. Legislation, pending before Congress regarding power plant siting, would require utilities to establish a ten year regional plan with information made available to state certifying agencies and the public ten years in advance of power plant construction. In July 1969, the Skelly Wright/Calvert Cliffs decision was made, requiring that each nuclear plant construction have an environmental impact statement which would consider thermal pollution and other environmental degradations, as well as operating hazards. This decision resulted in the writing of nearly one hundred environmental impact statements and could add two years to the time needed to get nuclear power plants into operation. New technological developments in energy production include: the liquid metal fast-breeder reactor, the offshore siting of large nuclear power stations, the improved efficiency of converting thermal to electrical energy, and the more efficient use of energy. SOME ECOLOGICAL EFFECTS OF DISCHARGED SUGAR MILL WASTES ON MARINE LIFE ALONG THE HAMAKUA COAST, HAWAII,
Hawaii Univ., Honolulu. Inst. of Marine Biology.
R. W. Grigg.
In: Hawaii Univ., Honolulu, Water Resources Research Center, Water Resources Seminar Series No. 2, December 1972, p 27-45. 7 fig, 7 tab, 9 ref.

Descriptors: *Marine biology, *Deposition(Sediments), *Food processing industry, *Hawaii, Pacific Ocean, Benthos, Coral, Marine fish, Reefs, Sugar cane, Sedimentation, Turbidity, Bioindicators, Industrial wastes.
Identifiers: *Hamakua coast(Hawaii), Sugar mill wastes, Bagasse.

A study was designed to evaluate the impact of sugarcane mill wastes on the marine environment off Hawaii's Hamakua coast since inorganic suspended solids settle out from the effluents accumulating on the bottom. Corals are very intolerant to sedimentation and may serve as sensitive indicators of particulate matter. Reef fishes also may be excellent indicators. No significant changes in temperature, salinity, or oxygen concentration were detected in the receiving waters off the sugar mills. Significant sediment deposits and bagasses exist in the immediate vicinity off the sugar mills at Pepeekeo, Hakalau, Ookala, and Honokaa. Intertidal organisms, coral, and other benthic invertebrates have been covered where sediments have accumulated. Recovery of coral and associated organisms in shallow water appears to begin soon after the mills cease discharging effluents. The pattern of distribution and abundance of Pocillopora meandrina, which is particularly sensitive to sedimentation, may be a good indicator of pollution by sugar mill wastes. Changes in both species and abundance of nearshore fishes have been observed off sugar mills where the catches were about one-third those off control stations. Fishermen agree that the major changes occurred shortly after mechanical harvesting of sugar cane began superseding the previous method of hand-harvesting. (See also W73-05857) (Jones-Wisconsin)

ORIGINS OF SUGAR MILL DISCHARGES ON THE HILO-HAMAKUA COAST AND A COURSE OF ACTION FOR THEIR CONTROL,
Brewer (C.) and Co. Ltd., Hawaii.
Q. D. Stephen-Hassard.
In: Hawaii Univ., Honolulu, Water Resources Research Center, Water Resources Seminar Series No. 2, December 1972, p 49-52. 6 fig.

Descriptors: *Sugarcane, *Effluents, *Hawaii, *Food processing industry, *Pollution abatement,

Coasts, Pacific Ocean, Soils, Harvesting, Fibers(Plant), Technology.
Identifiers: *Hilo-Hamakua coast(Hawaii), *Sugar mill wastes, Bagasse.

A largely aesthetic problem was created by sugar mill discharges along the Hilo-Hamakua coast off Hawaii due to the general practice of mechanical harvesting. Discoloration of the Pacific is caused by wash water effluents containing soil and fibrous waste products of cane cleaning and processing which the prevailing wet conditions and economic factors have precluded recycling for irrigation. While some mills will be closed others will handle the greater volume with firm pollution abatement plans to be implemented. One mill modification will include installation of a new boiler generator complex to consume all excess fibrous waste for generation and sale of electricity. Wastewater usage will be reduced by about 80% by dry cleaning cane with air blasts and using recycled mixed cane juice for final cleaning prior to milling. Improved harvesting techniques to reduce soil contact with cane are being developed. Although pollution abatement implementation is proceeding at best possible speed, the industry is considered in violation of the 1899 Refuse Act and court action is imminent. Ecological significance of the discharges is being evaluated against the costs of the injunction which could close all mill operations until clean-up is fully completed. RESILIENCE AND STABILITY OF ECOLOGICAL SYSTEMS,
British Columbia Univ., Vancouver. Inst. of Animal Resource Ecology.
C. S. Holling.
Research Report (1972). 50 p, 4 fig, 45 ref.

Descriptors: *Ecology, *Ecosystems, *Balance of nature, Environmental effects, *Fish management, Productivity, Ecological distribution, Reviews, *Behavior.

This review explores both ecological theory and the behavior of natural systems to see if different perspectives of their behavior can yield different insights that are useful for both theory and practice. The resilience and stability viewpoints of the behavior of ecological systems can yield very different approaches to the management of resources. The stability view emphasizes the equilibrium, the maintenance of a predictable world, and the harvesting of nature's excess production with as little fluctuation as possible. The resilience view emphasizes domains of attraction and the need for persistence. But extinction is not purely a random event: it results from the interaction of random events with those deterministic forces that define the shape, size and characteristics of the domain of attraction. The very approach, therefore, that assures a stable maximum sustained yield of a renewable resource, might so change these conditions that the resilience is lost or is reduced so that a chance and rare event that previously could be absorbed can trigger a sudden dramatic change and loss of structural integrity of the system. A management approach based on resilience, on the other hand, would emphasize the need to keep options open, the need to view events in a regional rather than a local context, and the need to emphasize heterogeneity. The resilience framework does not require a precise capacity to predict the future but only a qualitative capacity to devise systems that can absorb and accommodate future events in whatever unexpected form they may take. BIOLOGICAL ACTIVITY OF A CELL EXTRACT FROM THE DINOFLAGELLATE, AMPHIDINIUM CARTERI,
National Marine Fisheries Service, Milford, Conn. Milford Lab.
F. P. Thurberg, and J. J. Sasner, Jr.
Chespeake Sci. Vol 14, No 1, p 48-51. 1973. Illus.
Identifiers: Amphibian hearts, *Amphidinium-Carteri, Atropine, Biological studies, *Cardio vascular drugs, Cell, *Crustaceans, *Dino-flagellate, Extracts, Fish, *Molluscans, Mytolon, Toxins.

Some physiological and pharmacological effects of cell extracts from A. carteri cultures are described. Mice and fish were killed by injection of extracts from lyophilized cells concentrated by centrifugation. Cellular extracts of A. carteri increased the development of tension in crustacean hearts while inhibiting molluscan and amphibian heart activity. The inhibitory effect was blocked by pretreatment of molluscan hearts with mytolon and amphibian hearts with atropine. Such physiological tests and recent chemical information indicate that a choline-like substance(s) is produced by A. carteri.--Copyright 1973, Biological Abstracts, Inc.

FISHES, MACROINVERTEBRATES, AND HYDROLOGICAL CONDITIONS OF UPLANDS CANALS IN TAMPA BAY, FLORIDA,
National Marine Fisheries Service, St. Petersburg Beach, Fla. Gulf Coast Fisheries Center.
W. N. Lindall, Jr., J. R. Hall, and C. H. Saloman.
U.S. Natl Mar Fish Serv Fish Bull. Vol 71, No 1, p 155-163. 1973, Illus.
Identifiers: Bays, *Canals(Upland), Estuary, *Fish, *Florida(Tampa Bay), Hydrological studies, *Invertebrates, *Dissolved oxygen, Water pollution effects.

Faced with statutory restraints that prohibit dredging and filling of estuarine bottoms, coastal developers have turned to alternate methods of providing water front property for homesites. One method, recently used in Tampa Bay, Florida, is the construction of access canals that lead from open water to upland acreage. Biological and hydrological data from new upland canals together with some comparative data from older upland canals and bayfill canals are presented. In all types of canals, as presently engineered, stratified, stagnant water causes low levels of dissolved O2 in summer months, resulting in mortality or emigration among resident organisms. Means of alleviating the problems are discussed.--Copyright 1973, Biological Abstracts, Inc.

PRIMARY PRODUCTIVITY IN A NUTRIENT-LIMITED TROPICAL ESTUARY,
Hawaii Inst. of Marine Biology, Honolulu.
G. Krasnick, and J. Caperon.
Pac Sci, Vol 27, No 2, p 189-196, 1973, Illus.
Identifiers: *American Samoa(Pala Lagoon), Discharges, *Estuary(Tropical), Growth, *Nitrogen, Nutrients, *Phytoplankton, *Primary productivity, Wastes.

The results of a survey of phytoplankton productivity, chlorophyll a, and nutrient concentrations in Pala Lagoon, American Samoa, are shown to be interpretable in terms of 2 regimes: an ocean-dominated region where productivity is controlled by fixed N concentrations, and a land-runoff-dominated regime where productivity is unrelated to major nutrient concentrations. A quantitative relationship between nutrient concentrations in the lagoon and phytoplankton growth rates is presented. This relationship is used as the basis for predicting the effects of a proposed dredgi operation within the lagoon as well as for predi ing the effects of increased waste discharge ir the local marine environment.--Copyright 19 Biological Abstracts, Inc.

5D. Waste Treatment Processes

THE MICROBIOLOGY OF ACID MINE WAT TREATMENT IN PACKED BED COLUMNS,
Pennsylvania State Univ., University Park. D of Civil Engineering.
R. F. Unz, and M. T. Lieberman.
Available from the National Technical Infor tion Service as PB-229 649, $4.00 in paper co $1.45 in microfiche. Institute for Research Land and Water Resources, Pennsylvania S University, Research Publication No. December 1973. 73 p, 19 fig, 8 tab, 36 ref. OW A-024-PA(1). 14-31-0001-4038.

Descriptors: *Waste water treatm *Ferrobacillus, *Thiobacillus ferrooxidans, *Ac mine water, *Iron bacteria, Iron compou *Trickling filters, Isolation, Disinfection, M brane filters, Sulfur, Microbiology, Microorg isms, Oxidation, Microbial degradation.
Identifiers: Ferrobacillus ferrooxidans, Packed beds, Quaternary ammonium compound, Pl counts, Microtitre plate, Thiosulfates, Ferr iron.

ercolation of acid mine water through columns of ither argillite stone or 1.5 in. (3.8 cm) olypropylene trickling filter medium resulted in xidation of constituent ferrous iron. From 87 to 6 per cent of the influent ferrous iron could be oxlized in passage of mine water through a two foot 51 cm) column of synthetic filter medium at a ydraulic loading of 1.3 gpd/sq. ft. (52.7 lpd/m2) ffective surface area of medium. Ferrous iron oxlation was mediated by chemolithotrophic bacria which were isolated and identified as hiobacillus ferrooxidans. Iron encrusted filter edium solids were found to contain organic elatinous matrices in which microorganisms were mbedded. Several heterotrophic microorganisms ere isolated from matrices and solids. Iron oxlizing bacteria but not heterotrophs were sensive to a quaternary ammonium compound and the errous iron oxidation was curtailed in disinfected lter medium. Several morphologically distinuishable iron oxidizing bacteria were isolated om mine water on solid ferrous iron culture edia although efforts to reliably enumerate the acteria using spread plating and membrane filter ulture procedures were unsuccessful. In this re-rd, it was necessary to use a microtitre plateilution dispersion technique to culture the bacria present in natural samples from which most robable number (MPN) estimates of cell numbers ould be made.

VESTIGATION OF POROUS PAVEMENTS OR URBAN RUNOFF CONTROL,
ranklin Inst. Research Labs., Philadelphia, Pa.
. C. Grover, A. J. Hoiberg, T. I. Haigh, and E. helen.
opy Available from GPO Sup Doc as PI.16:11034 DUY 03/72, $1.25; microfiche from TIS as PB-227 516, $1.45. Environmental Protecon Agency, Water Pollution Control Research eries, March 1972. 142 p, 19 fig, 21 tab, 37 ref. PA 11034 DUY. 14-12-924.

escriptors: *Combined sewers, Treatment facilies, *Storm sewers, Water conservation, *Urban noff, Waste disposal, *Asphalt concrete, Comunity development, Solid wastes, Overflow, oads, Design, *Water pollution treatment.
entifiers: *Porous Pavements.

aboratory and economic studies were unrtaken to determine the feasibility of utilizing rous pavements to alleviate combined sewer erflow pollution and reduce the design parameers of storm sewer systems by allowing storm runoff to percolate back into the ground. Laboratory udies of candidate materials revealed a porous phaltic concrete containing 5.5% asphalt by eight and aggregate graded to allow a water flow 76 in. per hour to be the optimal porous road aterial. Materials testing for stability, durability, d freeze-thaw susceptibility proved this material itable for use in road construction. Asphalt Intute specifications were used to design roads th porous asphaltic concrete surfaces and gravel ses for varying traffic densities. Major design rameters considered were the load-bearing pacity and permeability of the subgrade, excted maximum precipitation and depth of frost netration. Roads designed with porous asphaltic ncrete were found to be generally more onomical than conventional roads with storm wers. The economics of porous pavement were ther enhanced by the added value of benefits m combined sewer overflow pollution relief, gmentation of municipal water supplies, imved traffic safety, preservation of vegetation, ief of flash flooding and the aesthetic and ectional benefits of a colored porous surface.

IN-PLANT MEASURES FOR REDUCTION OF THE SPECIFIC FRESHWATER CONSUMPTION OF PAPER MILLS,
Voith (J. M.) G.m.b.H., Heidenheim (West Germany).
J. Velinsky.
Translatiovailable from Inst. of Paper Chemistry, Appleton, Wis. 54911. Price: $5.00. Institute of Paper Chemistry, Appleton, Wisc, Translation, 9 p. Trans. from Das Papier, Vol 26, No 10A, Oct 1972.

Descriptors: Freshwater, *Water consumption, *Waste water treatment, *Water reuse, Water conservation, *Pulp and paper industry, *Industrial water, Water purification, Flotation, Filtration, Sedimentation, Settling basins, Recycling, Treatment facilities, Europe, Suspended solids, Retention, Spraying, Water circulation.
Identifiers: White water, Paper machines, Savealls, *Germany, Duo-Former(Paper machine), Showers(Paper machine), Wash water, Felts(Papermaking), Tissue papers, Printing papers, Newsprint.

A survey of 15 German paper machine installations indicated that the freshwater consumption per ton of paper produced varies greatly, depending on the kind of paper manufactured (newsprint, groundwood-containing vs. groundwood-free printing and writing papers, and tissue papers), as well as on the total daily production tonnage (relatively less water being used in high-production than in low-production units). For newsprint, 160 to 735 tons of water are needed daily; for fine papers, 100 to 370 tons; and for tissues, 58 to 120 tons. Few paper mills can recirculate machine white water without clarification, because fine fibrous debris and other suspended particles (such as fillers) can clog spray pipes, papermaking felts, and shower nozzles. Among various kinds of clarifiers, scraper and funnel savealls were found superior, in general, to disk filters, but their electric power demands are higher than those of flotation or sedimentation savealls. The latter's disadvantage is the longer retention time needed. Modern paper machines, such as the Duo-Former, are designed with simplified water circuits for conservation of freshwater. Some of these circuit diagrams are illustrated. (Brown-IPC)

Descriptors: *Aeration, *Aerated lagoons, *Pulp wastes, *Treatment facilities, *Waste water treatment, Turbines, Turbulence, Biochemical oxygen damand, Industrial wastes, Equipment, Oxygen, Oxygenation, Effluents, Pulp and paper industry, Oxidation, Foreign research, Electric power.
Identifiers: *USSR(Bratsk Pulp and Paper Mill), *Turbo-aerators.

A new Turbo-aerator with improved oxidizing power for treatment of pulp and paper mill effluents was developed at the All-Union Research Institute for the Pulp and Paper Industry. In essence it comprises two turbines mounted one above the other on a vertical shaft. Air is introduced below the bottom turbines via an annular perforated distributor which disperses air finely and intensifies turbulent oxygen exchange. The top turbine stirs the upper layers of the liquid waste, improves the exchange of oxygen between air and liquid, and eliminates foam. Pilot-plant installations evidenced an oxidizing capacity of 1500 g/cu m/day and a BOD reduction of 92-94% at a power consumption of 0.5-0.7 kw-hr/kg of 5-day BOD. Commercial installation of four larger turboaerators at the Bratsk Pulp and Paper Mill was found to double the efficiency of effluent aeration tanks compared to tanks using convential perforated-tube aerators. (Stapinski-IPC)

AUXILIARY USES OF DISINFECTION OXIDIZING AGENTS IN WATER TREATMENT,
American Water Works Service Co., Inc., Philadelphia, Pa.
M. E. Flentje.

In: Third Sanitary Engineering Conference on Disinfection and Chemical Oxidation in Water and Waste Treatment, conducted by Illinois Dept of Public Health and Univ of Illinois, Jan 31-Feb 1, 1961, Urbana: Univ of Illinois Bulletin, Vol 59, No 46, p 57-61, January 1962. 1 fig, 6 tab, 7 ref.

Descriptors: *Oxidation, *Water treatment, *Chlorination, Sanitary engineering, Manganese.

Oxidation is an important water treatment procedure and is the reaction involved in disinfection. Oxidation is also employed in taste and odor control, in the removal of iron and manganese, sometimes to oxidize hydrogen sulfide, and as an aid to coagulation. The most economical source of an oxidizing agent is the oxygen of the air. Chlorine dioxide, an oxidizing agent with greater capacity than chlorine, has found a definite place in water treatment. Particularly good in combating phenolic tastes and odors, it is used in dosages of from two to five pounds of sodium chlorite per million gallons. The oxidation reaction of Mn is slow and in most filtration takes place almost wholly in the filter bed itself, where it is removed by a combination of oxidation and catalysis. The speed of reaction increases as the pH of a solution increases. Potassium permanganate is a fast-acting, powerful oxidizing agent that can be used in neutral or slightly alkaline pH ranges. This chemical, in some cases, could displace both some Cl and Cl02 in taste and odor control and for Mn removal. (See also W74-05507) (Knapp-USGS)

SURVEY OF WASTEWATER FACILITIES AND RECEIVING WATERS AND PROPOSED PERFORMANCE SPECIFICATIONS, MCGUIRE AFB AND FT DIX, NEW JERSEY, VOLUMES I AND II,
Environmental Health Lab., Kelly AFB, Tex.
J. W. Tremblay, and N. J. Lamb.
Available from NTIS, Springfield, Va. 22151 as AD-766 895, and AD-766 896, for $3.00 printed copy (each vol.); $1.45 in microfiche. Technical Report EHL(K) 73-12, July 1973. 362 p (Vol I-58p; Vol II-304p), 7 fig, 24 tab, 12 ref, 9 append.

Descriptors: *Military reservations, *Sewage treatment, *Water pollution control, *New Jersey, Water pollution sources, *Waste water treatment, Public health, *Treatment facilities.
Identifiers: McGuire AFB(NJ), Fort Dix(NJ).

A field wastewater survey was conducted at McGuire AFB and Ft Dix, New Jersey in September 1972. Extensive physical, chemical and biological sampling and analyses of the sewage treatment plants and the surface waters to which the plants discharge were accomplished. The quality of the receiving waters is degraded as a result of the sewage plant discharges. These two federal facilities should join in efforts to create a regional wastewater management system, and until then maintain the existing secondary sewage treatment facilities with minimum expenditure of capital investment funds. Performance specifications are proposed for the interim period, and recommendations for interim upgrading of the existing facilities are made. Alternative courses of action are evaluated in the event the regional management system does not materialize. (Knapp-USGS)

GROUNDWATER RECHARGE WITH TREATED WASTEWATER,
Wisconsin State Univ., Oshkosh. Dept. of Geology.
C. W. Fetter, Jr., and R. G. Holzmacher.
Journal of Water Pollution Control Federation, Vol 46, No 2, p 260-270, February 1974. 77 ref.

Descriptors: *Waste water disposal, *Water reuse, *Artificial recharge, Water spreading, Injection wells, Waste disposal wells, Reclaimed water, Clogging, Bacteria, Viruses.

Artificial recharge of aquifers is a proven method for conservation of groundwater resources. The use of open basins, stream channels, and spray irrigation is possible with a typical secondary effluent, but recharge through wells requires wastewater of higher quality. Very slight turbidity and bacterial growths may lead to rapid clogging of recharge wells. Recharge of a fine- or medium-grained aquifer does not seem to lead to problems caused by pathogenic bacteria or viruses if the water travels several hundred feet and the aquifer is not fissured. Water quality improvement may also be effected by physical and biological processes in the soil. (Knapp-USGS)

THE BEHAVIOR OF PARTICULATE MATERIAL IN THE TREATMENT LAGOONS OF A BLEACHED KRAFT PULP MILL,
Bedford Inst., Dartsmouth (Nova Scotia). Atlantic Oceanographic Lab.
J. M. Bewers, and G. J. Pearson.
Water Air Soil Pollut, Vol 1, No 4, p 347-358, 1972, Illus.
Identifiers: *Particulate matter, *Pulp wastes, *Treatment lagoons, Industrial wastes, Water pollution sources, *Waste water treatment.

The effect of treatment lagoons on the suspended particular matter contained in Bleached Kraft Mill Effluent was studied. Good settling characteristics for coarse material were found, but fine particles remained in suspension throughout the system. When the treated effluent was discharged into the brackish water of a narrow tidal cove, the increased ionic strength of the medium promoted the combination of fine particles. This flocculation effect produced a larger concentration of coarse material in the treated effluent than was contained in the raw mill discharge. A procedure for artificial flocculation, within the treatment system was suggested as a method of improving both the treatment efficiency and the physical properties of the effluent released to the marine environment.--Copyright 1973, Biological Abstracts, Inc.

Identifiers: Module construction, Cost effectiveness, Soil absorption systems.

In order to improve the efficiency and effectiveness of wastewater systems, water quality management planning must precede facility construction. Goals must be set, and the effectiveness of the project must be determined from the perspective of costs, social effects, and environmental impact. More efficient means of constructing facilities would result if the uncertainties of future flow projections were reduced. The four primary factors which determine future waste treatment needs are population growth, extensions in domestic sewer coverage, new industrial connections, and a change in per capita waste generation. The uncertainty of population growth in a community is illustrated by census data for the decade 1960-1970. Module construction is the means suggested to deal with the uncertainty of waste treatment demand. This type of construction would provide the flexibility to respond to new technology or a change in the community growth pattern. A smaller community might find it more economical to improve its present soil absorption syste rather than provide an expensive collecti system. (See also W74-05629) (Pinsky-Wisconsin

ECONOMIC GUIDELINES FOR ANALYSIS C JOINT INDUSTRIAL-MUNICIPAL COLLE TION AND TREATMENT SYSTEMS,
Quirk, Lawler and Matusky Engineers, Tappa N.Y.
T. P. Quirk, and J. E. Shirk.
In: Proceedings of a National Symposium Costs of Water Pollution Control, April 6-7, 197 Raleigh, North Carolina, p 114-135. 3 fig, 7 ref.

Descriptors: *Waste treatment, *Industr wastes, *Treatment facilities, *Economic feasibi ty, Municipal wastes, Costs, Economics, Taxe Capital costs, Effluents, Operating costs, Pr treatment(Water), Methodology, Intercept sewers.
Identifiers: Joint industrial-municipal waste tre ment systems, Rate-making.

The economic factors which influence an indu try's decision whether to construct independe treatment facilities or to participate in a joint dustrial-municipal facility may be generaliz from EPA sponsored studies of the desi procedures and cost experiences in industrial a municipal waste treatment practices. One det mining economic factor is the pretreatment co for industrial effluents, with the requirement f pretreatment optimally based upon specific was water characteristics. Another factor to be co sidered is the tax relief provided industry by a celerated depreciation for the capital costs of dustrial treatment facilities, which is equivalent a construction grant of 17 percent. A third fac that must be considered is that traditional, m nicipal design practices include treatment facilit not normally included in an industrial facility, ra ing the capital cost of a joint treatment plant from 20 to 25 percent over that of an industr facility. A fourth consideration is the economies scale and consolidation which is estimated on t average to entail a 20 percent reduction in u construction and operating cost as wastewa flow doubles. Additional economic factors wh must be considered are interceptor costs and t rate-structure philosophy. (See also W74-056 (Pinsky-Wisconsin)

EFFECTIVE POLLUTION CONTROL INVES MENT,
Environmental Protection Agency, Washingto D.C. Div. of Municipal Waste Water Programs.
R. C. Palange.
In: Proceedings of a National Symposium Costs of Water Pollution Control, April 6-7, 197 Raleigh, North Carolina, p 149-157.

Descriptors: *Waste treatment, *Investmen *Water pollution control, *Municipal waste Treatment facilities, Federal Water Pollution Co trol Act, Federal Government, Sewers, Sewa treatment, Technology, Design, Constructio Population, Operation and maintenance, Gover ment finance.
Identifiers: *Cost effectiveness, Municipal was water treatment.

The municipal wastewater treatment facilities co struction program, which provides for the co struction of waste treatment works, is direct toward three major goals: (1) to help bring wa pollution from municipalities under control achieving a rate of construction which will ov

come the unmet backlog of needed facilities; (2) to keep pace with needs for new facilities resulting from population growth; and (3) to match the need to replace facilities which become obsolete because of age, technical advancement, or population shifts. Some waste treatment facilities built under this program were not as successful as expected due to failure to utilize new technology and improved design practices, poorly trained operators, inadequate plant maintenance, and inefficient plant operation. The cost effectiveness of the program suffers from excess sewer connections and excess plant capacity. More efficient utilization of capital and an alternative investment procedure could result in more rapid progress in pollution abatement with higher cost effectiveness. INDUSTRY VARIANCE OF CONSUMER PRICES AND COMPETITION AS A CONSEQUENCE OF WATER POLLUTION ABATEMENT,
Auburn Univ., Ala., School of Business.
H. B. Pickle, and A. C. Rucks.
In: Proceedings of a National Symposium on Costs of Water Pollution Control, April 6-7, 1972, Raleigh, North Carolina, p 218-229. 1 fig, 4 tab.

Descriptors: *Water pollution control, *Competitive prices, *Textiles, *Steel, *Alabama, Effluents, Costs, Unemployment, Waste water treatment, Industrial wastes, Foreign trade, Economic impact.
Identifiers: Consumer prices.

Increased costs to industry associated with the installation of effluent treatment facilities could seriously disturb a firm's competitive position. The rise in per unit costs must be either absorbed by the producer, passed on to the consumer, or partially absorbed and partially passed on. The effect of water pollution abatement expenditures on competition in an industry depends on factors such as transportation costs, degree of labor costs, and unit price. A study of the textile industry in Alabama found that the costs of pollution abatement could not be passed on to the consumer. This is due to the small size of most textile producers, the relatively homogeneous products produced, and foreign competition. A firm that tried to raise prices to cover the costs of waste water treatment would lose between 24 and 36 percent of its market to other domestic firms, and between 14 and 17 percent to imports. In the steel industry, pollution abatement is more costly and difficult than in the textile industry. Profits are not sufficient to cover the costs of both cleaning up the environment and modernizing facilities. If the increased costs were passed on to consumers, imports would increase and domestic unemployment would rise. (See also W74-05629) (Pinsky-Wisconsin)
W74-05640

BENEFIT-RELATED EXPENDITURES FOR INDUSTRIAL WASTE TREATMENT,
Syracuse Univ., N.Y. Dept. of Civil Engineering.
N. L. Nemerow.
In: Proceedings of a National Symposium on Costs of Water Pollution Control, April 6-7, 1972, Raleigh, North Carolina, p 230-246. 2 fig, 2 tab.

Descriptors: *Waste treatment, *Industrial wastes, *Cost-benefit ratio, *Economic justification, Water pollution, Marginal income, Marginal costs, Pulp and paper industry, Recreation, Income, Waste water disposal, Water utilization, Methodology, Costs, Benefits.
Identifiers: *Industrial waste treatment, Economic stability.

Industrial waste treatment and economic stability are both desirable goals which at times may be mutually exclusive. Waste treatment may cost more than an industrial plant can afford, forcing either pollution to be allowed or a loss of jobs and income. This raises the question of whether pollution abatement costs are justifiable. Dollar benefits of a clean water resource can be derived by evaluating recreation use benefits, withdrawal water use benefits, wastewater disposal benefits, land value benefits, and in-stream water use benefits. The total cost of maintaining that water quality level can be compared to the benefits derived. This enables the computation of a per unit charge for a pollution carrying capacity which can be applied to industrial wastes. Two industrial economics ratios have potential application in water pollution abatement. These include the relationship of waste treatment costs to production costs, and the cost of waste treatment for each 1000 gallons of waste treated. A feasible method of determining a firm's financial capability to provide waste treatment is illustrated. (See also W74-05629) (Pinsky-Wisconsin)
W74-05641

COSTS OF WATER POLLUTION CONTROL IN THE CHEMICAL INDUSTRY,
Datagraphics, Inc., Pittsburgh, Pa.
H. C. Bramer.
In: Proceedings of a National Symposium on Costs of Water Pollution Control, April 6-7, 1972, Raleigh, North Carolina, p 247-254. 2 ref.

Descriptors: *Water pollution control, *Waste treatment, *Chemical industry, Industrial wastes, Treatment facilities, Capital costs, Operating costs.
Identifiers: Plant size, Joint industrial-municipal treatment plants, In-plant treatment.

The costs that would be incurred by the organic and inorganic chemical industries in attaining levels of water pollution abatement through 1973 are summarized. Production in the organic chemical industry was estimated at 120.7 billion pounds in 1969 and 156.0 billion pounds in 1973. The principal contaminates are BOD, COD, oil, suspended solids, acidity, heavy metals, color, taste and odor producing compounds and residual organic products and by-products. While joint industry-municipal waste treatment has proved effective, especially for smaller plants located near large municipal treatment systems, separate treatment has been shown to have economic advantages. Production in the inorganic chemical industry was estimated at 328.7 billion pounds in 1969 and projected at 455.5 billion pounds for 1974. Pollution control expenditures may affect this industry to a greater extent, because of a recent fall in the overall price index. Contaminates come primarily from electrolysis and crystallization brines, washings from filter cakes, spent acid and alkalies, and washings from raw materials. The inorganic chemical industry has also generally found that in-plant, separate waste treatment facilities have economic advantages, particularly when large quantities of waste water are involved. Data is presented for the operating and capital costs of various treatment levels. (See also W74-05629) (Pinsky-Wisconsin)
W74-05642

COSTS OF WATER POLLUTION CONTROL IN THE PAPER INDUSTRY,
National Council of the Paper Industry for Air and Stream Improvement, Inc., New York.
I. Gellman.
In: Proceedings of a National Symposium on Costs of Water Pollution Control, April 6-7, 1972, Raleigh, North Carolina, p 255-270. 9 tab, 3 ref.

Descriptors: *Water pollution control, *Pulp and paper industry, *Cost-benefit analysis, *Economic impact, Water quality, Capital costs, Waste treatment, Waste water treatment.
Identifiers: Zero discharge.

The water pollution control costs of the paper industry have risen significantly between 1959 and 1972. During this time capital expenditures rose from $100 million to $816 million and annual charges rose from $14 million to $122 million, while the treatment costs rose from 0.75 to 6.4 cents per 1000 gallons. The A. D. Little estimate of treatment costs would result in a median price increase for paper products of $8.5 per ton or 5.5 percent. Also, the industries capital spending for pollution control could reach 40 percent of total capital outlays. A zero discharge treatment requirement could result in a 50 percent increase in product cost to the public. With these treatment costs rising, cost-benefit analyses must begin to take into account the benefits resulting from the institution of pollution control measures and allow for the physical quantification of improvements in water quality which result from pollution control expenditures, in order to be a realistic tool for management decision making. SOIL STORAGE LIMITATIONS ON EFFLUENT IRRIGATION,
Missouri Univ., Columbia. Dept. of Forestry.
C. D. Settergren.
Water Resources Bulletin, Vol 8, No 6, p 1273-1276, December, 1972. 2 fig, 9 ref.

Descriptors: *Sewage treatment, *Sewage disposal, *Waste water disposal, Pollution sources, Irrigation, *Water reuse, Recycling.

Over 23 billion gallons of sewage effluent are discharged in the United States each day. Increasingly strict water quality laws make effluent irrigation more inviting. At an application level of two inches per week, 129 acres are required to dispose of one million gallons of waste water per day. Dangers do exist and are delineated. With careful planning and reconnaissance, the disposal site can be selected to allow for more favorable disposal and renovation potential through irrigation. (Skogerboe-Colorado State)
W74-05676

REMOVAL OF MERCURY COMPOUNDS FROM WATER,
Phillips Petroleum Co., Bartlesville, Okla. (assignee).
R. P. Williams.
U.S. Patent No. 3,769,205, 3 p, 2 tab, 14 ref; Official Gazette of the United States Patent Office, Vol 915, No 5, p 1843, October 30, 1973.

Descriptors: *Patents, Industrial wastes, Mercury, *Sulfides, Chemical reactions, Pollution abatement, Water quality control, Water pollution control, *Heavy metals, *Separation techniques, *Waste water treatment.
Identifiers: Disulfides, Hydrocarbyl sulfide, *Mercury compounds.

By contacting an aqueous mixture contaminated by dissolved mercury compounds with a water insoluble organic sulfide or disulfide, preferably a hydrocarbyl sulfide or disulfide, all but minor amounts of the mercury contaminant can be removed from the water. The organic layer can be separated from the water layer. If desired, mixtures of one or more sulfides or disulfides or a mixture of a sulfide and disulfide may be employed as the extraction agent. (Sinha - OEIS)
W74-05684

METHOD OF TREATING WASTE WATER THROUGH ELECTROLYSIS,
Mitsui Mining and Smelting Co., Ltd., Tokyo (Japan). (assignee).
M. Ichiki, and M. Ishii.
U.S. Patent No. 3,769,186, 4 p, 2 tab, 6 ref; Official Gazette of the United States Patent Office, Vol 915, No 5, p 1839, October 30, 1973.

Descriptors: *Patents, *Waste water treatment, Industrial wastes, *Water purification, *Oil pollution, *Heavy metals, Suspended solids, *Electrolysis, Aluminum alloys, Pollution abatement, Water quality control, Water pollution control, Ions.

A method is described of treating waste water which is characterized by the purification of the industrial waste water containing at least one member of the group consisting of oil, emulsion, heavy-metal ion and suspended solid matter through electrolysis employing an aluminum alloy as the anode. Use of an aluminum alloy as the anode for electrolysis makes it possible to function continuously and for a long period of time by checking the rise in cell voltage. (Sinha - OEIS)
W74-05685

MICROBIAL DEGRADATION OF PETROLEUM,
Bioteknika International, Inc., Alexandria, Va. (assignee).
E. N. Azarowicz.
U.S. Patent No. 3,769,164, 7 p, 4 tab, 4 ref; Official Gazette of the United States Patent Office, Vol 915, No 5, p 1835, October 30, 1973.

Descriptors: *Microbial degradation, *Biological treatment, *Patents, Oil spills, *Oil pollution, Bacteria, Actinomycetes, Yeasts, Fungi, *Microorganisms, Pollution abatement, Water quality control, Water pollution control, *Waste water treatment.
Identifiers: Petroleum, Crude oils, Hydrocarbons.

Selected bacteria, actinomycetes, yeasts, and filamentous fungi break down crude petroleum, thus they can convert masses of spilled oil into masses of edible, nontoxic living cells. The microorganisms are special species that have been mutated to achieve the objectives of the invention. They have been deposited with the American Type Culture Collection in Rockville, Md. and are given ATCC catalogue numbers. (Sinha - OEIS)
W74-05686

SLUDGE TANK WITH SELF-CLEANING SCREEN AND SCREEN FOR USE THEREIN,
Clarkson Industries, Inc., New York. (assignee).
D. H. Hoag.
U. S. Patent No. 3,768,657, 4 p, 5 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 915, No 5, p 1717, October 30, 1973.

Descriptors: *Patents, *Filters, *Sedimentation, *Waste water treatment, *Sludge treatment, Pollution abatement, Water quality control, Water pollution control, *Screens, *Settling basins.

The conveyorized sludge tank is the type in which relatively coarse objects are separated by sedimentation from a liquid medium in which they are suspended and then removed from the tank by the flights of a moving conveyor positioned partially within the tank. The tank is provided with a screen mounted at the bottom of the tank for swinging motion toward and away from the flights of the conveyor and adapted to lean against a course of the conveyor to cause the conveyor flights to continuously wipe the filtering surface of the screen. The screen is preferably formed in sections, each of which has spaced filtering strips and the filtering strips of adjacent sections diverge to form a herringbone pattern that minimizes and equalizes wear on the conveyor flights. W74-05687

IMPROVED PROCESS FOR TREATMENT OF AQUEOUS SUSPENSIONS,
K. A. Kraus.
Available from NTIS as PAT-APPL-148132(70); $3.00 paper copy, $1.45 microfiche. Atomic Energy Commission Patent Application Serial No. 148,132(70), May 28, 1971. 8 p, 2 tab.

Descriptors: *Patents, *Filtration, *Filters, *Waste water treatment, Separation techniques, Water quality control, Pollution abatement, Equipment, Water pollution control.
Identifiers: *Water clarification.

To maximize the benefits of cross-flow filtration, a method is provided for continuous removal of the surface cake or surface film which builds up on the filter during cross-flow filtration of a slurry at a minimal fluid velocity with or without a salt-rejecting membrane deposited on the filter. A method of treating aqueous waste streams for the purpose of removing a soluble or dispersed moiety comprises passing the stream through a vertically disposed, porous, permeable material which contains a zone of fluidization and a solid fluidizing medium in the zone at a velocity sufficient to affect transpiration of a purified water product through the material. Cake buildup can be effectively eliminated if cross-flow filtration is allowed to take place in a vertically disposed permeable filter hose in the presence of a fluidized bed of solid abrasive particles which have the capacity to remove the bulk of any deposited solid cake. (Sinha - OEIS)
W74-05690

RAW LIQUID WASTE TREATMENT SYSTEM AND PROCESS,
Jet Propulsion Lab., Pasadena, Calif.
M. F. Humphrey.
Available from NTIS as N73-31011, $3.25 paper copy, $1.45 microfiche. National Aeronautics and Space Administration Patent Application Serial No. 390,467, August 22, 1973. 21 p, 2 fig.

Descriptors: *Patents, *Waste water treatment, *Organic wastes, *Liquid wastes, Activated carbon, Pollution abatement, Water quality control, Water pollution control, *Sewage treatment, *Settling basins.

In the process, substantially all the non-dissolved matter in the raw sewage is first removed from the sewage water in a primary settler. The separation is facilitated by the addition of partially used activated carbon and ash material which was already used downstream. The sewage water from which the non-dissolved matter was removed is directed to a secondary settler. This water contains dissolved organic matter. The separated non-dissolved matter together with the used activated carbon and ash material from the primary settler are filtered to remove the water and are then supplied to a pyrolysis reactor where they are converted into fresh activated carbon and ash material. The latter, in the form of a primary slurry, is combined in a settler with the water in which organic matter is dissolved. The fresh activated carbon and ash material desorbs the dissolved organic matter and thereafter is returned upstream to the primary settler to facilitate the separation of the non-dissolved matter from the incoming raw sewage. The novelty resides in the formation of the activated carbon and ash material from the sewage contaminants without the addition of any reagents and, more particularly, in the use of this material first downstream to remove dissolved organic matter and only thereafter upstream to facilitate the removal of non-dissolved matter from the incoming raw sewage. (Sinha - OEIS)

SEWAGE: THE SURPRISING RESOURCE,
California Attorney General's Environmental Task Force, Sacramento.
W. Marx.
The Nation, Vol 216, p 588-591, May 7, 1973.

Descriptors: *Water reuse, *Sewage treatmen *Sewage disposal, *Reclamation(Waste water *Reclaimed water, Irrigation practices, Domest wastes, Industrial wastes, Tertiary treatmen Waste water treatment, Water resources manage ment, Water allocation, Water resources, Wat quality, Effluents.
Identifiers: *Sewage salvage.

Sewage salvage or water reclamation may outstri weather modification, sea-water conversion, an other methods as the most feasible new wat source. Changing aspects of both water manage ment and sewage treatment make water reclam tion more plausible. Sewage treatment is divide into primary, secondary, and tertiary levels. Th main obstacle to water reclamation is more instit tional than technical. Irrigation of crops and park has become a common way to use reclaimed wat particularly in arid areas. Industry is anothe potential user of reclaimed water. Some wat management agencies belittle water reclamatio and prefer to divert water from another region t satisfy their water gluttony. Water reclamation stimulating institutional reforms--to adopt to a era of limited resources. Reclamation, however no panacea for America's water problem. The N tional Industrial Pollution Control Council re ported that water withdrawals would exceed th maximum supply shortly after 1980. (Sperlin Florida)

CONSTRUCTION OF WASTEWATER FACILITIES, LUFKIN, TEXAS (FINAL ENVIRONMENTAL IMPACT STATEMENT).
Federal Highway Administration, Austin, Tex.
Available from National Technical Informatio Service, Springfield, Va. 22151, as PB-204 907-F $3.00 paper copy, $1.45 microfiche. February 1972. 188 p, 12 tab, 13 map, 1 illus, 1 chart.

Descriptors: *Environmental effects, *Wast water treatment, *Treatment facilities, Publi health, Environmental sanitation, Sewag disposal, Waste water(Pollution), Sewage e fluents, Interceptor sewers, Pumping plant Sewage, Sludge treatment, Pipelines, Alternativ planning, Alternative costs, *Texas.
Identifiers: *Environmental Impact Statements *Lufkin(Tex).

This project consists of constructing sanitar sewer interceptors, pumping stations, force mains waste treatment facilities, and appurtenance within and near the city of Lufkin, Texas. Th proposed project is designed to provide waste water facilities to meet anticipated demands of fu ture development. It is intended to relieve the ex isting inadequate facilities, the effluents of whic are currently polluting the receiving streams an creating health hazards. Alternative proposal which were considered include using tw processing systems and the feasibility of combin tion of new facilities and utilization of existin facilities. Any adverse effects on the environmer that will result from the construction and opera tion of the new facilities should be minimal whe compared to the benefits received by the loc population and to the ecological enhancement tha will be realized. A MATHEMATICAL MODEL FOR AEROBIC DIGESTION,
National Environmental Research Center, Cincinnati, Ohio.
R. Smith, R. G. Eilers, and E. D. Hall.
Available from NTIS Springfield, Va 22151 as PB-222 029 Price $3.75 printed copy; $1.45 microfiche. EPA National Environmental Research Center, Cincinnati, Ohio, Publication, July 1973. 45 p, 9 fig, 5 tab, 12 ref, append.

Descriptors: *Aerobic treatment, *Waste water treatment, Computer programs, Sewage treatment, Design, Costs, *Activated sludge, *Mathematical models, *Sludge treatment, Sludge disposal.
Identifiers: *Aerobic digestion.

Design and cost relationships for various modifications of the aerobic digestion process for disposal of waste organic sludges were studied in a mathematical model. The aerobic digester can be operated on a continuous basis with a settler or on a fill and draw basis, for reducing the volume of waste activated sludge only or for digesting a combination of primary and waste activated sludge. The concentrations of other constituents such as phosphorus and nitrogen in the effluent streams were calculated. (Knapp-USGS)

A REVIEW OF WASTEWATER PROBLEMS AND WASTEWATER MANAGEMENT PLANNING IN THE SAN FRANCISCO BAY REGION, CALIFORNIA.,
Geological Survey, Menlo Park, Calif. Water Resources Div.
W. G. Hines.
Open-file report. January, 1973. 54 p, 8 fig, 16 tab, 3 append, 33 ref.

Descriptors: *Municipal wastes, *Waste water treatment, Waste water, *Waste treatment, *Waste water disposal, *California, Water pollution, Water pollution treatment, Water treatment, Waste disposal, Pollution, Long-term planning, Water quality, Toxicity, Pesticides, Water pollution effects, Reviews.
Identifiers: *Waste water management, *San Francisco Bay Area(Calif.), Regional planning, Municipalities.

Various agencies are engaged in comprehensive management planning for the San Francisco Bay Region. Initial objectives are consolidation and coordination of facilities and the elimination of wastewater discharges in ecologically sensitive areas. Quantities of wastewater discharged in the area are enormous and continually increase with population and economic growth and urban development. Total volume of pollutants contained in wastewater discharges, as measured by BOD (biochemical oxygen demand), biostimulant concentrations, and toxicity has increased despite large expenditures for new treatment facilities. Pollutants from other sources, such as agriculture and storm water runoff, have increased. Comprehensive programs propose industrial and municipal wastewater management for waste now discharged into the Bay with interim and long-range plans. Priority is placed on constructing wastewater-conveyance facilities to transport wastewater from areas where pollution is most acute. Local and sub-regional goals must be identified and evaluated to coincide with long-range state and federal wastewater management goals. Public awareness and participation is important for effectiveness of a management program due to interaction of social, economic, and environmental factors. (Grden-North Carolina)
W74-05863

WATER AND SEWER NEEDS OF LOW INCOME FAMILIES FOR THE MID-CUMBERLAND REGION OF TENNESSEE.
Mid-Cumberland Council of Government, Nashville, Tenn.
Available from the National Technical Information Service as PB-221 741; $4.25 in paper copy, $1.45 in microfiche. Final Report No. M-COG-1002-4. April, 1973. 36 p, 6 tab. CPA-TN-33-1002-308.3. CPA-TN-33-1002.

Descriptors: *Sewers, Water distribution(Applied), *Water costs, *Water demand, Water policy, Public utility districts, Cities, Planning, *Tennessee, *Plumbing.
Identifiers: *Low-income households, Mid-Cumberland Region(Tenn.), Public Service Commission, Federal incentive programs, Matching funds, Plumbing fixtures, Nashville(Tenn.).

Families living in the Mid-Cumberland Region with incomes under $4000 per year comprise 13.25% of the total number. Plumbing fixtures are absent from 10.2% of the households. A county-by-county breakdown of these percentages indicates a high correlation between the presence of low income families and households lacking in plumbing facilities. Several factors contribute to this situation. First, low income districts are not readily annexed into a city's or district's service area due to the low tax return expected or the area's inability to pay for services. Secondly, the Public Service Commission has no jurisdiction over utility districts, only municipalities. Consequently, the provision of water and services in utility districts is not responsive to the wishes of the public, but rather is a function of the market. A set of countywide water and wastewater commissions having jurisdiction only within their county would alleviate this problem, making the decision to provide services a political one and thus subject to the normal political processes. Thirdly, low income families are frequently unable to connect to nearby water and sewer lines due to high tap fees. The tremendous cost of installing plumbing fixtures is another deterent. The HUD water and wastewater facilities program provides an incentive for local matching money for areas with populations less than 10,000, within a SMSA, with unemployment twice the national average, and with poor or blighted conditions. Use of this program in low income areas would encourage the lowering of tap fees for qualified low-income families. (Hoffman-North Carolina)
W74-05870

SHAWNEE COMPREHENSIVE PLAN, WATER WORKS SYSTEM AND SANITARY SEWERAGE SYSTEM,
Benham-Blair and Affiliates, Inc., Oklahoma City.
E. M. Fry.
Available from the National Technical Information Service as PB-222 271; $4.25 in paper copy, $1.45 in microfiche. Memorandum No. 4, Final report. Prepared for Office of Community Affairs and Planning, Oklahoma City, Okla. January, 1973. 36 p, 7 fig, 5 tab, append. CPA-OK-06-56-1015.

Descriptors: *Comprehensive planning, *Waste water treatment, *Sewage treatment, *Water distribution(Applied), Water consumption, Water management(Applied), *Oklahoma, Water pollution, Sewerage, Long-term planning, Computer models.
Identifiers: *Shawnee(Okla), Oklahoma City(Okla).

The water and sewer portions of the Shawnee Comprehensive Plan are updated. Population will increase from 25,075 in 1970 to 32,480 or 33,980 by 1995, with most growth in the urbanizing area. Water consumption in 1972 was 100 gallons per capita per day, and 125 gallons are projected for 1995. Sanitary sewage flow is 88 gallons/day and is expected to increase slightly. Computer analysis is done for the water distribution system by simulating the pipe network; reduced pipe capacities due to encrustation appear. Essential features of the water and sewer system Master Plan for the 20-year period include a new raw water source by 1985, increased water treatment capacity, new trunk mains to improve water distribution, a minimum size of 12 inches for new mains, elevated storage, new treatment facilities north of the city, and new gravity sewers to eliminate the need for lift stations. A development program consists of five-year periods for planning initiation and orderly system expansion. (Grden-North Carolina)
W74-05871

SCAPE; A COMPUTER MODEL FOR ALTERNATIVE SEWER SYSTEM COST EVALUATION,
Southwestern Pennsylvania Regional Planning Commission, Pittsburgh.
J. P. DeAngelis, and R. A. LaMacchia.
Available from the National Technical Information Service as PB-224 717; $5.00 in paper copy, $1.45 in microfiche. December, 1972. 58 p, 9 fig, 5 tab. 93009335. Pa-P242.

Descriptors: *Computer models, Mathematical models, *Cost-benefit analysis, *Feasibility studies, Model studies, Cost allocation, *Costs comparison, Project planning, *Pennsylvania, Water policy, Waste water treatment, Waste disposal, Sewage, Sewage disposal, Sewerage, Sewage treatment, *Sewers, Water treatment.

SCAPE (Sewer Costs for Alternative Plan Evaluation), an analytic computer technique programmed in FORTRAN IV, estimates sewage system construction and operating costs to determine the least cost sewer system configuration. Given an area to be sewered, the number of people and workers to be served, a topographic map describing the area, analysts can devise alternative sewer service configurations and test them for least cost. A single expected cost and a cost range, based on the prediction interval of the cost estimating equations, is produced for each alternative. By comparing cost ranges of several alternatives, one determines if he has a statistically valid least cost solution or only an approximate one which arises when cost ranges of the lowest cost solutions overlap. This means a least cost solution cannot be statistically valid. The model also estimates sewage flow, pipe size, and slopes for alternatives. Alternatives may include gravity or forced flow, a system or combination of systems, and a variety of treatment facilities depending on the required effluent quality. It is possible to operate SCAPE in conjunction with a stream quality model to obtain best solutions from both a cost and pollution abatement standpoint. (Grden-North Carolina)
W74-05873

REGIONAL WATER AND SEWER CAPITAL IMPROVEMENTS PROGRAM.
Northwest Missouri Regional Planning Commission, Maryville.
Available from the National Technical Information Service as PB-223 792; $3.00 in paper copy, $1.45 in microfiche. Report No. NWMRPC-73-303. June, 1973. 10 p, 7 tab. Mo. P-200/SA-190.

Descriptors: *Management, *Sewage treatment, *Missouri, Costs, Sewage districts, Financing, Long-term planning, Sewage disposal, Waste treatment, Sewerage, Waste water treatment, Water quality, Waste water disposal, Waste disposal, *Regional analysis, *Sewers.
Identifiers: Regional planning, Capital investment, *Capital improvements.

The Northwest Missouri Regional Planning Commission, as part of its continuing planning and management program, maintains a Capital Improvement Program, with water and sewer im-

provements for the region described here. It updates the 1970 Comprehensive Plan for Water and Sewer Development. This report aids the Commission in judging timeliness of applications for federal assistance, lends support to individual improvement attempts, and notifies state and federal funding sources of the type, scope, cost, and timing of projects needing their assistance. Cities needing new sewage facilities and renovation of existing facilities, improvement of force mains, and improvements in collection systems by 1990 are specified, at a cost of $9,000,000. Six Rural Water Districts needed by 1975 are specified at a cost of $2,750,000, and 13 districts to be needed by 1990, are estimated to cost $5,595,000. Improvements can be financed through general revenue sharing funds, federal and state loans and grants, general obligation bonds, and revenue bonds. (Grden-North Carolina)
W74-05874

PRELIMINARY FEASIBILITY STUDY FOR THE POJOAQUE VALLEY SEWERAGE SYSTEM.
Northern Area Planning Organization, Sante Fe., N. Mex.
Available from the National Technical Information Service as PB-224 780; $4.50 in paper copy, $1.45 in microfiche. August, 1973. 70 p, 10 tab, 3 fig, 1 append. CPA-NM-1004-LP/D2.5.

Descriptors: *Sewage treatment, *Cost analysis, Cost-benefit analysis, *Feasibility studies, *Waste water treatment, *Indian reservations, Project planning, *New Mexico, Sewerage, Sewage disposal, Water quality, Long-term planning, Sanitary engineering.
Identifiers: *Pojoaque Valley(New Mexico), Waste water management, Santa Fe(New Mexico), Regional planning, Pueblo Indian grants.

Cost figures and preliminary design information for a comprehensive sewerage system to serve Pojoaque Valley, New Mexico area, approximately 16 miles north of Santa Fe, are presented. Total proposed project covers an area of about ten square miles, mostly in the alluvial plains of the Pojoaque River, Rio Tesuque and the Pojoaque Creek. Valley population is expected to double in two decades. Preliminary construction cost estimates range from $4,000,000 to $6,000,000. Operation and maintenance would cost $41,000 per year, and with grants from state and federal governments, cost per customer would range from $5 to $16 per month. However, without full participation of communities, cost per home would increase. Sinking funds are also needed to replace worn equipment and cover debt repayment. Financing through federal and state grants and general revenue sharing bonds can be used. Before proceeding further, other information is needed, including involvement of Pueblo Indian Tribal officials with easement rights, investigation of participation which can be expected in granting easements and paying for house connections, investigation of water quality to ascertain the degree and extent of surface and groundwater contamination from septic tanks, investigation of treated waste water reuse, definition of proposed sewer district boundaries and sewer ordinances, investigation of funding programs, establishment of a coordinating committee, and investigation of total value of assessed property in involved communities to determine possible bonding capacity of the sewer association. (Grden-North Carolina)
W74-05875

WATER SUPPLY AND WATER POLLUTION CONTROL CAPITAL PROGRAM, 1972-1985.
Delaware Valley Regional Planning Commission, Philadelphia, Pa.
(1972). 92 p, 35 tab, 14 fig.

Descriptors: *Comprehensive planning, *Delaware River, Management, Water sources, *Water pollution control, *Water supply, Water pollution, Pennsylvania, New Jersey, Water policy, Waste treatment, Environmental effects, Sewage treatment, Water treatment, Regional development, Long-term planning.
Identifiers: *Delaware River Valley Region, Philadelphia(Pa.), Capital programming, *Regional planning.

The Regional Water Supply and Water Pollution Capital Program, adopted by the Delaware Valley Metropolitan Region in 1972 to accompany the regional plan, will guide development in the region by relating priorities, environmental impact, and available finances. Uniform methodology for analysis and standardization of construction costs were used to determine scheduling allocations. Time adjustments between county master plans and the regional plan were made. As of 1972, 391 capital development projects were proposed for the nine-county region, an expenditure exceeding 1.2 billion dollars. Geographically, 148 projects are scheduled for New Jersey and 243 for Pennsylvania, at costs of 292 million and 930 million dollars, respectively. Twenty-three sewage treatment plants are proposed, with expansion of 46 others. Approximately 73% of pollution control expenditures in New Jersey and 92% in Pennsylvania are scheduled before 1978. In water supply expenditures, 1972-1977 accounts for 66% of New Jersey expenditures and 83% for Pennsylvania. Federal funding can now represent 75% of sewage facility costs, and a federal Environmental Financing Authority helps local and state governments raise money for their share of costs. With increased federal participation, proposed regional development looks promising. (Grden-North Carolina)

MANAGEMENT OF STORM DRAINAGE AND FLOOD CONTROL ACTIVITIES.
Denver Regional Council of Governments, Colo.
Available from the National Technical Information Service as PB-224 110; $4.00 in paper copy, $1.45 in microfiche. Project REUSE, Final Report (Supplement). August, 1972. 38 p, 2 tab, 6 fig. HUD COLO-USE-1. DHUD-H-1392.

Descriptors: *Storm drains, *Urban drainage, *Management, *Project planning, *Drainage systems, *Flood control, Groundwater, Comprehensive planning, *Colorado, Multiple-purpose projects, Water quality, Water pollution, Drainage water.
Identifiers: Project REUSE, Systems management, *Denver(Colorado), Systems approach.

Drainage and flood control management approaches are not consistent within the Denver, Colorado, region and are fragmented and crisis-oriented in scope. Responsibilities of drainage management require coordinated efforts of the elective, planning, and technical levels. The systems approach differentiates the technical, management, political, and economic aspects of complex systems. Governing officials establish goals and objectives, and planning management must develop alternative conceptual designs of drainage systems to meet objectives. Criteria for decision making, an important part of the systems approach, are supplemented by priorities based on available resources. Implementation of the plan requires an implementing agency which can also perform technical functions. Coordination among levels is essential to identify and resolve new issues and to discharge functional responsibilities. Drainage systems management includes describing the current system status and defining problems correctly. Considerations include defining physical elements, describing the functional processes, identifying limiting resources, and identifying undesirable functional interactions. Continuous informational interchange is needed, especially with multi-jurisdictional projects and to foreseee how decisions will impinge on other systems areas. (Grden-North Carolina)
W74-05878

PLANNING MANUAL FOR STORM DRAINAG AND FLOOD CONTROL.
Denver Regional Council of Governments, Colo.
Available from the National Technical Inform tion Service as PB-224 109; $8.25 in paper cop $1.45 in microfiche. Project REUSE - Final Repo (Supplement), August, 1972. 139 p, 23 tab, 26 fi append. HUD COLO-USE-1. DHUD-H-1392.

Descriptors: *Systems analysis, *Managemen *Flood control, *Storm drains, Floods, Storm r noff, Urban drainage, *Colorado, Water polic River basins, River basin development, Runof Comprehensive planning, Drainage, Drainag systems, Drainage practices, Drainage wate Drainage basins, Drainage area, City planni Pollution.
Identifiers: Project REUSE, *Denver(Colorado Systems approach, Master planning, Maj drainage.

Systems engineering methodology used for maj drainage planning in Denver, Colorado, presented. Systems to satisfy specific user nee by modifying an existing system or by designing new one proceed through eight steps, includin defining the problem, gathering data, describin the system, defining objectives, developing model, describing alternatives, analyzing outpu and implementing decisions. Major drainag defined as presently unwanted flows of flood storm runoff resulting from natural events an managed in the fluid state, has systems charac teristics. The eight functions provide a base f analysis and development of short- and long-rang programs of drainage systems. Methodology pr vides technology, procedures, and standards f designing master plans. Systems approaches ar necessary for clear problem definition, an essen tial for finding maximum functional capability a minimum cost. Methodology is applied to the r gion by dividing it into ten planning basins, wit subbasins used to determine applicable drainag action. Mathematical models to relate aspects o drainage analysis and design are included. (Grden North Carolina)

LIQUID AERATION METHOD AND AP PARATUS.
S. M. Candel.
U.S. Patent No. 3,768,788, 7 p, 8 fig, 6 ref: Officia Gazette of the United States Patent Office. Vo 915, No 5, p 1749, October 30, 1973.

Descriptors: *Patents, *Sewage treatment *Aeration, *Oxygenation, Equipment, *Liqui wastes, *Waste water treatment, Pollution abate ment, Water quality control, Water pollution con trol.

Aeration of sewage is achieved by arrangin several diffusing surfaces in an optimum patter around the tank and transmitting an identical quan tity of air through each diffusing surface so tha several columns of air bubbles rise to the surface This maximizes the rate of air/liquid interfac production by increasing the mean velocity dif ference between air and liquid, and enhancing th degree of localized microturbulence. The re sidence time of the air bubbles is also increase and oxygenation is more efficient. (Sinha-OEIS)
W74-05883

DISPERSED GROWTH BIOLOGICAL SEWAGE TREATMENT PROCESS.
Oklahoma State Univ., Stillwater. (assignee)
D. F. Kincannon, A. Macuila, and W. G. Tiederman, Jr.
U.S. Patent No 3,769,204, 2 p, 1 fig, 4 ref: Official Gazette of the United States Patent Office, Vol 915, No 5, p 1843, October 30, 1973.

Descriptors: *Patents, *Sewage treatment, *Organic wastes, Metabolism, *Oxidation, *Biological treatment, *Waste water treatment.

Identifiers: Hydrocyclonic, *Secondary treatment.

A dispersed growth biological secondary sewage treatment process for removing dissolved organic material and suspended organic material from sewage conprises of the following steps: metabolize the dispersed biological solids to yield new cell material, carbon dioxide and water; subject the metabolized medium to hydrocyclonic forces to separate it into clean effluent and concentrated biological solids; and totally oxidize the concentrated biological solids in a saturation environment. The oxidation tank provides a starvation environment for the biological cells so that they will digest themselves. Air is injected into the tank and the new cell growth results in the production of water and carbon dioxide. The outflow is then injected by pump into the hydroclone concentrator. The outflow from the contrator is recycled until clear effluent is discharged as a nonpollutant. (Sinha - OEIS)
W74-05884

APPARATUS AND METHOD FOR REMOVING SOLIDS FROM LIQUIDS,
Rockwell International Corp., El Segundo, Calif. (assignee)
L. R. McCoy.
U.S. Patent No. 3,770,605, 6 p, 9 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 916, No 1, p 246, November 6, 1973.

Descriptors: *Patents, Electric fields, *Electrodes, *Waste water treatment, Equipment, *Pollution abatement, Solid wastes, Liquid wastes.
Identifiers: Hydrocyclonic, *Secondary treatment.

An apparatus and method are described for enhancing the effects of electrical fields in achieving the removal of finely divided solids from liquids. The apparatus includes an electrical cell structure consisting of at least two electrodes one of which is insulated, means to supply interrupted direct current or low frequency alternating current to the electrodes, and means to pass liquid contaminated with solid particles between the electrodes. A surface for collecting solids may also be interposed between the electrodes. (Sinha-OEIS)
W74-05885

WASTE TREATMENT APPARATUS,
Fairchild Industries, Inc., Germantown, Md. (assignee)
H. D. Freudenthal, R. E. Townsend, P. K. Zawoiski, and E. Schatz.
U.S. Patent No. 3,779,911, 12 p, 7 fig, 1 ref; Official Gazette of the United States Patent Office, Vol 917, No 3, p 1087, December 18, 1973.

Descriptors: *Patents, *Waste water treatment, *Sewage treatment, Equipment, *Microorganisms, *Aeration, Pollution abatement, Water quality control, Water pollution control, Hydrogen ion concentration.

A rotatable waste treatment drum is inclined in a stationary frame so that the waste sewage will flow from the inlet toward the outlet under the influence of gravity while being exposed to separate treatment stages in batches, separated within the drum by a helical member. The helical member is connected to the interior wall of the drum and to an axial hollow core and forms a plurality of variably spaced convolutions that are formed about the axial hollow core. As the drum rotates the batches of waste sewage disposed in the lower segment of the drum between the convolutions of the helical member are successively raised to a high level as the drum is rotated and the waste is undergoing treatment. Clarified liquid effluent is removed during the treatment cycle through the hollow core and part of the treated liquid effluent containing active microorganisms is introduced to the untreated waste entering the inlet end of the drum. Rotation of the drum and selective aeration of the waste sewage is controlled by a system associated with the drum. The control system has chemical sensing and dispensing apparatus that sense the chemical concentrations or pH of the wastes being treated and add chemicals to the wastes when needed. (Sinha-OEIS)
W74-05889

WATER CLARIFICATION PROCESS USING SILICON-CONTAINING AMINOMETHYL PHOSPHONATES,
Petrolite Corp., Wilmington, Del. (assignee)
D. Redmore, and F. T. Welge.
U.S. Patent No. 3,779,912, 10 p, 2 tab, 1 ref; Official Gazette of the United States Patent Office, Vol 917, No 3, p 1088, December 18, 1973.

Descriptors: *Patents, Water treatment, *Corrosion control, *Waste water treatment.
Identifiers: *Water clarification, *Chemical treatment, Phosphonates, Silicon, Alkyleneamino, *Scale inhibitors.

The silicon atom is silicone functional (i.e., has a -SiO-group) and is also attached to an alkyleneamino group which may have one or more amino groups (i.e., an alkylene-amin group having at least one N-H group) capable of reacting with a carbonyl compound (i.e., aldehyde or ketone) and phosphorous acid, or a derivative thereof, to form aminomethyl phosphonic acid. All, or less than all, of the N-H groups may be converted to aminomethyl phosphonic acids. The silicon-aminomethyl phosphonic acids may be monomeric, polymeric, or copolymeric. They are useful, for example, as corrosion inhibitors, scale inhibitors, water clarifiers and for other uses. (Sinha-OEIS)
W74-05890

WATER TREATMENT,
W. C. Martin.
U.S. Patent No. 3,779,913, 5 p, 5 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 917, No 3, p 1088, December 18, 1973.

Descriptors: *Patents, *Waste water treatment, *Oxidation, Bubbles, Pollution abatement, Water pollution control, Water quality control, Equipment, *Aeration.
Identifiers: Compression, *Pressure vessels.

The method of treating water in a pressure vessel comprises the following steps: filling the vessel with a predetermined amount of air; adding a predetermined amount of water to the vessel, thereby compressing the air; recirculating the air from the top of the vessel and bubbling it through the water, thus inter-contacting the air and the water for a predetermined time, then venting the air, and draining the treated water. (Sinha-OEIS)
W74-05891

WATER RECLAMATION-ALGAE PRODUCTION,
Era, Inc., Clovis, N. Mex. (assignee)
J. E. Ort.
U.S. Patent No. 3,780,471, 7 p, 2 fig, 1 tab, 7 ref; Official Gazette of the United States Patent Office, Vol 917, No 4, p 1224, December 25, 1973.

Descriptors: *Patents, *Waste water treatment, Pollution abatement, Suspended solids, Bacteria, Virus, Organic wastes, Phosphates, Nitrogen, *Algae, *Aerobic treatment, *Anaerobic conditions, *Reclamation, Water quality control, Water pollution control, Ponds.
Identifiers: Decarbonation.

Wastewater is treated in a manner which greatly reduces the level of organic waste matter, phosphates, fixed nitrogen, bacteria, virus and suspended solids. Water is reclaimed and an algae by-product is recovered by employing a series of three ponds with different depths and detention periods, each of which performs specific functions. A dissolved-air-lime flotation step is then used to separate suspended materials (primarily algae). After the flotation step the water is held at a high pH to achieve total disinfection prior to recarbonation to stabilize the water. The by-product algae material is refined by centrifugal separation of calcium carbonate from the slurry or, optionally, by alkaline hydrolysis of protein from the algae followed by acid precipitation to yield a high quality protein concentrate. One pond performs the anaerobic function, another the decarbonation function and an intermediate pond performs the aerobic function. (Sinha-OEIS)

W74-05895

AEROBIC SEWAGE TREATMENT,
Bertran and Hargraves, Inc., Tampa, Fla. (assignee)
W. J. Hargraves.
U.S. Patent No. 3,780,997, 4 p, 10 fig, 14 ref; Official Gazette of the United States Patent Office, Vol 917, No 4, p 1362, December 25, 1973.

Descriptors: *Patents, *Aerobic treatment, Organic wastes, Pollution abatement, *Bubbles, *Liquid wastes, *Waste water treatment, *Sewage treatment, Equipment.
Identifiers: Biochemical digestion.

Contact between a gas stream and a mass of liquid sewage is achieved by use of several open ended inclined air-lift pipes immersed one above another in the liquid sewage. A stream of gas bubbles is introduced into the lowermost pipe whereby liquid is entrained therein. The upper end of each pipe, except the uppermost pipe, is disposed in a position below the lower end of the next higher pipe so that air bubbles issuing from the upper end of a lower pipe cause the liquid entrained therewith to be forced outwardly into the mass of liquid sewage. Gas bubbles subsequently enter the lower end of the next higher pipe and entrain new liquid sewage from the mass of liquid. (Sinha-OEIS)
W74-05896

WASTE TREATMENT SYSTEM,
Dayton Mfg. Co., Ohio. (assignee)
V. Materese.
U.S. Patent No. 3,782,550, 6 p, 13 fig, 8 ref; Official Gazette of the United States Patent Office, Vol 918, No 1, p 279, January 1, 1974.

Descriptors: *Patents, *Waste water treatment, Slurries, *Filtration, Pollution abatement, Equipment, Water pollution control, Water quality control, Separation techniques.
Identifiers: *Chemical treatment.

The solids are separated from the liquids in a two stage operation. In one embodiment of the invention a series of settling chambers are utilized for the initial separation, while in a second embodiment screens having openings of decreasing size in the downstream direction are utilized. Both systems thereafter utilize a cylindrical filter to provide final separation of the solids from the liquids. The resulting liquid effluent passes from the filter into a mixing section of the treatment tank where it is mixed with an additive to render it pathogenically harmless and is thereafter discharged from the system when displaced by an incoming charge of sewage slurry. (Sinha-OEIS)
W74-05898

DECANTING CENTRIFUGE FOR DRAINING OFF WATER FROM SEWAGE SLUDGE,
Kruger (I.) A/S, Copenhagen (Denmark). (assignee)
J. Bye-Jorgensen, and G. H. Larsen.
U.S. Patent No. 3,782,623, 3 p, 2 fig, 12 ref; Official Gazette of the United States Patent Office, Vol 918, No 1, p 298, January 1, 1974.

Descriptors: *Patents, *Sewage treatment, *Centrifugation, *Waste water treatment, *Sewage sludge, Pollution abatement, Water pollution control, Water quality control, Equipment.
Identifiers: Centrifuges.

The decanting centrifuge for draining off water from sewage sludge has a rotating bowl and helical walls rotating in it to scrape the sludge towards the end of the bowl to discard it. The rotating bowl has a small diameter in the region where the introduction takes place, to restrict the free drop of the sludge to a small distance, and at the same time providing a smooth passage, such as a conus, from the narrow part of the bowl to the wider part. This is important to secure a gradual increase of velocity and to reduce any tendency to create turbulence. (Sinha-OEIS)
W74-05899

PROCESS FOR RECOVERING FOREST PRODUCT PLANT WASTES,
R. E. S. Thompson.
U.S. Patent No. 3,783,128, 3 p, 1 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 918, No 1, p 418, January 1, 1974.

Descriptors: *Patents, Bark, *Wood wastes, Sawdust, *Pulp wastes, *Activated carbon, Pollution abatement, *Filtration, *Waste water treatment, Pulp and paper industry.
Identifiers: Mill wastes, Forest products.

Solid cellulosic waste can be carbonized and, in a second stage, the charcoal produced can be formed into activated carbon. The activated carbon is then used as a filtration medium for liquid cellulosic waste which, when it becomes loaded, is recycled to the carbonizing step. The carbon and entrained solids are returned to one of the furnaces. Off-gas from all furnaces is passed to a boiler for steam generation; the spent gas is passed through an absorber, if necessary, before release. (Sinha-OEIS)
W74-05900

WASTE AND WATER TREATMENT SYSTEM,
Westinghouse Electric Corp., Pittsburgh, Pa. (Assignee).
A. B. Turner.
U.S. Patent No. 3,784,014, 5 p, 2 fig, 1 tab, 4 ref; Official Gazette of the United States Patent Office, Vol 918, No 2, p 680, January 8, 1974.

Descriptors: *Patents, *Waste water treatment, Equipment, *Filtration, *Suspended solids, Activated carbon, Dissolved solids, *Electrophoresis, Separation techniques, Pollution abatement, Water pollution control, Water quality control.
Identifiers: Electrophoretic coalescene.

A minimum size, maximum effluent quality treatment apparatus is obtained by sizing the surge conditioning for minimim volume and the filtration system for maximum flow and performance. The filtration-absorption system includes at least one column of a bimetallic media. The particles of filter media having differing electrode potentials produce a galvanic cell and attract ionized particles in the throughput solution. Several columns may make up the filtration system. In one example, the media in the first column is 20 to 50 mesh aluminum powder. This filter medium performs a dual function. First it removes the conditioned suspended solids remaining in the liquid after the gross solids separation step performed by a coiled spring conveyor separator, and second it adds coagulating ions to the remaining liquid by corrosion of the aluminum powder. These aluminum ions precipitate and coagulate any suspended material and some of the dissolved material remaining in the liquid. After passing through this first column, the liquid goes to a stripper column. The stripper operation is based on the principle of electrophoretic coalescence. The stripper column may be filled with a mixture of aluminim powder and granular carbon which react to form a galvanic cell and attract the ions remaining in solution. The third column is filled with activated carbon. (Sinha-OEIS)
W74-05905

LIQUID TREATMENT PLANT AND PROCESS, PARTICULARLY FOR WASTE WATER,
Canadair Ltd., Montreal (Quebec).
J. E. Chatfield.
U.S. Patent No. 3,779,910, 4 p, 3 fig, 3 ref; Official Gazette of the United States Patent Office, Vol 917, No 3, p 1087, December 18, 1973.

Descriptors: *Patents, *Liquid wastes, *Waste water treatment, *Treatment facilities, Equipment, *Water purification, *Flocculation, Pollution abatement, Water quality control, Water pollution control.
Identifiers: Coagulants.

A process comprises serially flowing liquid containing impurities under gravity at predetermined relative velocities through several stages. A chemical coagulant is fed to the waste water influent and stirred to counter the normal flow to achieve extended residence time and reduce throughflow velocity of the waste water mixture through the mixing stage. The waste water mixture is then funneled to the bottom portion of the flocculation chamber. The mixture is raised through one field of suspended particles, recirculating deposited sludge into the flocculation chamber to enhance flocculation. Then by pumping deposited sludge into the flocculation chamber the sludge settles to produce supernatant. The sludge supernatant flows into the flocculation chamber and tumbles the waste water mixture, raises the mixture through another field of suspended particles, passes the mixture through curtains of falling floc and between sedimentation trays for deposition of the sludge and the formation of a clarified waste water mixture. The latter is chemically treated to obtain satisfactory flocculation and sludge deposition conditions in order to produce a purified waste water effluent which is allowed to overflow. (Sinha-OEIS)

ATP POOLS IN ACTIVATED SLUDGE,
Kansas State Univ., Manhattan. Dept. of Chemical Engineering.
S. Y. Chiu, I. C. Kao, L. E. Erickson, and L. T. Fan.
Journal Water Pollution Control Federation, Vol 45, No 8, p 1746-1758, August 1973. 18 fig, 4 tab, 30 ref. OWRR A-045-KAN(3) 14-31-0001-3516.

Descriptors: *Activated sludge, *Waste dilution, *Waste water treatment, Waste identification, Biological treatment, Sludge treatment.
Identifiers: *Process identification, *Adenosine triphosphate, Process control.

The possibility of using adenosine triphosphate (ATP) in process identification and control is investigated. Its suitability according to fixed criteria is discussed and other methods evaluated. Results of experiments indicate that dilution rat can affect sludge activity and cellular ATP conten significantly and that ATP concentrations in ex periments with both continuous and batch culture were generally proportional to the biomass and t the amount of substrate removed. Because ATI concentration responds rapidly to cell viability an changes with population shifts and the phase o growth, it is concluded that ATP may be a usefu variable in process identification, operation, an control, although further understanding of th relationship between ATP concentration and ac tivated sludge behavior is necessary if its ful potential as a measurable variable is to be realized

OPTIMAL PLANNING FOR A THERMAI DISCHARGE TREATMENT SYSTEM,
California Univ., Los Angeles. Dept. of Engineer ing Systems.
J. A. Dracup, and T. J. Fogarty.
Water Resources Research, Vol 10, No 1, p 67-71 February 1974. 2 tab, 7 ref.

Descriptors: *Water pollution control, *Therma pollution, *Treatment facilities, Planning, Rive basins, Methodology, *Dynamic programming *Simulation analysis, *By-pass piping, Tempera ture, Economics, Nuclear powerplants, Con straints, Equations, Reach(Streams), System analysis, Mathematical models, Optimal develop ment plans.
Identifiers: *Cost minimization.

The characteristics and economic implications o thermal pollution are considered within the con text of the planning of a treatment system for a se ries of hypothetical nuclear power plants that ar to be located adjacent to a river. The problem is t determine the optimal planning of a treatmen system. The objective of the planning procedure i to minimize the total annual cost for the construc tion and operation of the entire system, subject t a maximum temperature requirement within eacl reach or section of the river. The problem is solve by considering the effect that a bypass-pipin system has on temperatures within the river. Th technique of bypass piping consists of pipin wastewater downstream to reaches of a rive where the regenerative powers of the physica system have reduced the level of pollution to th extent that more waste water may be disposed. B noting that the bypass-piping system allows th beginning and end temperatures of a section of th river to be controlled, a procedure can b developed for separating the optimization mode of the entire system. This model is separated into set of small subproblems that are solved by simu lation and a system problem that is solved b dynamic programming. Results show that th bypass-piping system significantly reduced th cost of the entire treatment system. (Bell-Cornell)

HIGHLIGHTS OF THE FEDERAL WATER POLLUTION CONTROL ACT OF 1972,
Morgan, Lewis and Bockius, Washington, D.C.
C. W. Smith.
Dickinson Law Review, Vol 77, No 3, p 459-491, Spring 1973. 121 ref.

Descriptors: *Legislation, *Water law, *Pollution control, *Permits, *Standards, Water quality, Water quality control, Waste discharge, Waste disposal, Industrial wastes, Pollutants, Pollution effects, Federal government, Administrative agencies, Jurisdiction, Effluents, State governments, Long-term planning, Navigable waters, Rivers, Lakes, Streams, Oceans, Water development.

The Federal Water Pollution Control Act of 1972 authorizes the Environmental Protection Agency (EPA) to deal with water pollution throughout the United States. The effect to industrial dischargers of effluents is described. The Act is two-pronged in that it imposes effluent limitations as well as water quality standards. The effluent discharge limitations on the discharge of pollutants will be enforced primarily by the issuance of a permit to discharge, contingent upon the situs state of the discharge certifying that the discharge complies with the Act. Federal jurisdiction extends to all navigable waters and emanates as well from the 'general welfare' clause in the Constitution. Discharge limitations focus upon the technology used at the source of the pollution to control and reduce it. Water quality standards deal generally with the results to be achieved. Industry is no longer provided with a license to pollute, but in fact must use all the technological developments at its disposal to develop sound pollution-free discharge systems by the target dates provided. The Act also extends to oil spills and ocean dumping as well as inland waterways. (Silber-Florida)

CHLORINE: ITS DEVELOPMENT, CHARACTERISTICS AND UTILITY FOR DISINFECTION AND OXIDATION,
Chlorine Inst., New York.
E. J. Laubusch.
In: Third Sanitary Engineering Conference on Disinfection and Chemical Oxidation in Water and Waste Treatment, conducted by Illinois Dept of Public Health and Univ of Illinois, Jan 31-Feb 1, 1961, Urbana: Univ of Illinois Bulletin, Vol 59, No 46, p 6-17, January 1962. 11 fig, 2 tab, 12 ref.

Descriptors: *Chlorination, *Chlorine, *Reviews, Disinfection, Waste water treatment, *Water treatment, Sanitary engineering.

The utility of chlorine in water treatment is attributable to its toxicological characteristics and its strong oxidation capacity. Chlorine is employed either to destroy or control bacteria, or to modify the chemical character of the water, or for both purposes. Not all chlorine forms are equally efficacious for all purposes. Although chlorine as a chemical oxidant has considerable utility in water treatment, by far its most important use is for disinfection, and for nuisance and other organism control. Combined chlorine forms, principally inorganic chloramines, are effective for disinfection providing the concentration and exposure time are adequate. (See also W74-05507) (Knapp-USGS)
W74-05508

FEEDING, HANDLING AND STORAGE OF CHLORINE,
Fischer and Porter Co., Maywood, Ill. Midwest Region.
R. D. Mann.
In: Third Sanitary Engineering Conference on Disinfection and Chemical Oxidation in Water and Waste Treatment, conducted by Illinois Dept of Public Health and Univ of Illinois, Jan 31-Feb 1, 1961, Urbana: Univ of Illinois Bulletin, Vol 59, No 46, p 18-28, January 1962. 8 fig.

Descriptors: *Chlorination, *Chlorine, *Reviews, Disinfection, Waste water treatment, *Water treatment, Sanitary engineering.

The proper facilities and operating procedures for storage, handling, and feeding of chlorine should never be thought of as being so commonplace that there is no need for either improvement or periodic training. Proper chlorination should begin with building facilities designed for maximum covenience compatible with maximum safety. Chlorine containers and the chlorine feeding equipment should be stored in rooms with no other equipment present. Although the cost of chlorination is a small percentage of the total plant cost, its contribution to the overall processing is extremely important from the public safety standpoint. Because of the virtual necessity of chlorination it is extremely important to: know the process both in its advantages and limitations; train personnel in safety procedures and proper maintenance of equipment; have the proper physical facilities for storing, handling, and feeding chlorine; and, finally, make a careful analysis of system requirements for special storage, handling, and feeding control to get maximum value for money spent. THE GERMICIDAL EFFICIENCY OF SILVER, IODINE AND QUATERNARY AMMONIUM COMPOUNDS,
Public Health Service, Cincinnati, Ohio. Div. of Water Supply and Pollution Control.
C. W. Chambers.
In: Third Sanitary Engineering Conference on Disinfection and Chemical Oxidation in Water and Waste Treatment, conducted by Illinois Dept of Public Health and Univ of Illinois, Jan 31-Feb 1, 1961, Urbana: Univ of Illinois Bulletin, Vol 59, No 46, p 29-42, January 1962. 3 fig, 6 tab, 34 ref.

Descriptors: *Disinfection, *Water treatment, *Waste water treatment, Bromine, Iodine, Silver, Ammonia, Sanitary engineering.

Silver, quaternary ammonium compounds, iodine, chlorine dioxide, bromine, and ultraviolet light are discussed as germicides for water treatment. The cost of using UV is difficult to relate to the price of chlorine, but the cost of current alone would be many times that of sufficient chlorine to do the same job. Chlorine dioxide is unstable, extremely corrosive, and a definite explosion hazard. Some of the advantages of using bromine are: it is easier to feed and not as hazardous to store as chlorine; the bactericidal efficiency of bromamines formed in swimming pools is much greater than that of chloramines; apparent freedom from complaints of eye irritation; and odors are not troublesome. Liquid bromine costs approximately 3.5 times as much as chlorine. Because of objectionable flavors and toxic effects quaternary ammonium compounds have not been seriously considered for use in drinking water. The Food and Drug Administration does not permit their use in milk and food products. They have been suggested for use to control algae in swimming pools. Another use for which they have been advocated is prevention of growths in cooling system water. The application of silver is limited to situations where cost is not a primary consideration. While some reduction in dosage with iodine might be considered because of probable increased persistence of the germicidal residual, the economics are strongly against the use of iodine as a substitute for chlorine except under circumstances where cost is a secondary consideration. ANALYTICAL PROCEDURES FOR THE CONTROL OF DISINFECTANTS IN WATER TREATMENT,
Georgia Inst. of Tech., Atlanta. School of Applied Biology.
R. S. Ingols.
In: Third Sanitary Engineering Conference on Disinfection and Chemical Oxidation in Water and Waste Treatment, conducted by Illinois Dept of Public Health and Univ of Illinois, Jan 31-Feb 1, 1961, Urbana: Univ of Illinois Bulletin, Vol 59, No 46, p 42-47, January 1962. 1 fig, 4 ref.

Descriptors: *Disinfection, *Chlorination, *Analytical techniques, Laboratory tests, Chlorine, Sanitary engineering, *Water treatment.

The quantity and quality of disinfectants used in water can be controlled by various analytical procedures. Simple test can be used readily by nonprofessional personnel for routine plant operation; complex procedures for more limited use by professionally trained people can provide information about the intensity of the possible disinfecting reactions as well as the quantity of the compounds present. These test are briefly reviewed. (See also W74-05507) (Knapp-USGS)

WATER PURIFICATION APPARATUS AND CARTRIDGE THEREFOR,
H. N. Industries, Inc., New Haven, Conn. (assignee)
J. V. Zirlis.
U.S. Patent No. 3,780,867, 4 p, 1 fig, 5 ref; Official Gazette of the United States Patent Office, Vol 917, No 4, p 1327, December 25, 1973.

Descriptors: *Patents, *Activated charcoal, *Water purification, Diatomaceous earth, *Filtration, *Water treatment, Potable water, *Waste water treatment.

The water purification apparatus includes an elongated housing having a water inlet port and a water outlet port. A cartridge comprising an elongated casing is adapted for flow of water from the outside to the interior and then out one end for exit through the outlet port of the housing. The casing of the cartridge contains an activated charcoal medium as one water treatment stage. Surrounding the casing are two superposed sleeves comprising mesh of a gauge effective to retain coarse particulate matter in water flowing therethrough. A diatomaceous earth layer between the two stages defines another water treatment stage. (Sinha-OEIS)
W74-05895

OZONATING APPARATUS FOR DRINKING WATER,
Moody Aquamatic Systems, Inc., Meadville, Pa. (Assignee).
V. R. Troglione.
U.S. Patent No. 3, 784,008, 7p, 9 fig, 7 ref; Official Gazette of the United States Patent Office, Vol 918, No 2, p 678, January 8, 1974.

Descriptors: *Patents, *Water purification, *Ozone, Bacteria, Pollutants, *Odor, *Taste, Water quality control, *Potable water, *Water treatment.

Drinking water is purified by automatically supplying ozone gas to remove undesirable bacteria, contaminants and/or undesirable odors or tastes from the water. With this apparatus ozone gas is automatically applied to contaminated water in a contact tank, and is then transferred to a discharge tank in such manner that contaminated water cannot accidentally pass from one to the other tank, when the system is on automatic operation. Electrical controls responsive to sensing means disposed exteriorly of the contact tank, and responsive to predetermined changes in the weight or level of the water in the contact tank, automatically replenish the supply of ozonated water in the discharge tank, when necessary. (Sinha-OEIS)
W74-05904

METHOD AND APPARATUS FOR MIXING GASES WITH WATER,
Water Treatment Corp., City of Industry, Calif. (Assignee).
S. W. Beitzel, and R. F. Edwards.
U.S. Patent No. 3,775,314, 4 p, 4 fig, 2 ref; Official Gazette of the United States Patent Office, Vol 916, No 4, p 1493, November 27, 1973.

Descriptors: *Patents, *Oxygenation, *Ozone, *Water purification, Water quality control, Equipment, *Water treatment, Clathrates.

Water is purified by increasing the concentration and retention time of ozone and/or oxygen in water. The cyclonic mixing apparatus used consists of a hollow housing having an end wall; a cylindrical shaped wall attached to the end wall and defining a liquid receiving space. An inverted frustrum shaped wall is attached to the cylindrical wall opposite to the end wall. A liquid accelerating space is joined with a liquid receiving space. A whirling mass of fluid is injected into the body of water to be purified. In the body of water there is created a partial vacuum zone containing water and water vapor. Oxygen and/or ozone gas is introduced at a pressure of less than about 15 psi forming bubbles. As water vapor forms and cools water vapor condenses on the surface of the bubbles to form a clathrate molecule thus increasing the retention time of ozone and oxygen. (Sinha-OEIS)

CYPRETTA KAWATAI, A NEW SPECIES OF FRESHWATER OSTRACODA (CRUSTACEA),
Geological Survey, Washington, D.C.
I. G. Sohn, and L. S. Kornicker.
Proc Biol Soc Wash. Vol 85, No 26, p 313-316, 1972. Illus.
Identifiers: Biomphalara-glabrata, *Crustacea, Cypretta-kawatai, New species, *Ostracoda(Freshwater), Predator, *Schistosomiasis, Vectors, Water pollution control, *Snails(Vectors).

Cypretta kawatai is described on the basis of several hundred specimens, in all stages of growth, from aquaria in the Johns Hopkins University, Baltimore, Maryland. The habitat is presumed to be freshwater ponds and ditches in Belo Horizonte, Brazil. This species is an effective predator of Biomphalaria glabrata, a vector snail of the blood fluke that causes schistosomiasis.

PART 124--STATE PROGRAM ELEMENTS NECESSARY FOR PARTICIPATION IN THE NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM.
40 C.F.R. Part 124 (1973). 22 p.

Descriptors: *Federal government, *Permits, *Pollutants, *Discharge, *Water quality control, Administrative agencies, *State governments, Interstate compacts, Navigable waters, Standards, Regulations, Water quality, Water policy, Pollution control, Pollution abatement, Waste disposal, Effluents, Chemical wastes, Biological wastes, Radioactive wastes, Legal aspects, Water law, Planning, Cooperation.

Guidelines are established that specify procedural and other elements which must be present in a state or interstate program in order to obtain approval of the Administrator of the Environmental Protection Agency (EPA) for participation in the National Pollution Discharge Elimination System (NPDES). Any state or interstate program participating in the NPDES must have a statute or regulation, enforceable in State courts, which prohibits discharges of pollutants by any person, except as authorized pursuant to an NPDES permit. Any state or interstate agency participating in the NPDES shall insure that no permits shall be issued authorizing any of the following discharges: radiological, biological or chemical warfare agents or high-level radioactive wastes into navigable waters; or any discharge determined by the Secretary of the Army that would substantially impair anchorage and navigation. Additionally, each permit granted shall state the effluent standards and limitations as well as the water quality standards which must be observed by a discharger. (Silber-Florida)

HUMAN ECOLOGY AND COASTAL-ZONE POLLUTION,
Scripps Institution of Oceanography, La Jolla, Calif.
M. D. Bradley.
Water Air Soil Pollut. Vol 1, No 4, p 405-414, 1972.
Identifiers: *Coastal pollution, *Ecology, Land management, Water pollution, *Environmental resources.

The awareness of environmental problems has created a favorable climate for an intellectual orientation relevant to contemporary problems. Translating public opinion and legislation into long-range planning and rational policy for environmental resources is no simple task; an understanding of ecological principles, economic realities, and governmental jurisdictions and programs is needed. The present condition of inshore seas estuaries, and coastal-zones demonstrates how many immediately inadverse decisions prove damaging over the long run. The principles of general ecology, can provide helpful insights into managing the complex natural and human ecosystems of the coastal land-water interface. The concepts of carrying capacity, limiting factors, productivity, and homeostasis lead to a more complete understanding of pollution. Pollution can be defined as a residual, a left-over from production and consumption activities. Residual management becomes a matter of social choice, a process by which the underpriced assimilative capacity of the environment is treated as an input into social accounting and is priced accordingly. The ability of governments to provide effective management for environmental quality will depend upon the implementation of rationally determined development plans based on an understanding of residuals management. The natural resource ecosystems of coastal areas can provide man with increased benefits in the form of visual amenities, recreational benefits, and ecosystem homeostasis. Problems of management are critical and increasing.--Copyright 1973, Biological Abstracts, Inc.

ANALYSIS OF ECONOMIC IMPACTS OF ENVIRONMENTAL STANDARDS ON THE BAKERY INDUSTRY, PART I, EXECUTIVE SUMMARY.
Ernst and Ernst, Washington, D. C.
Available from National Technical Information Service as PB-207 169 $3.00 in paper copy, $1.45 in microfiche. Council on Environmental Quality, Washington, D.C. December 1971. 4 p.

Descriptors: *Costs, *Industries, *Pollution abatement, Water pollution control, *Economic impact, Pricing.
Identifiers: *Baking industry.

A study of the impacts of pollution abatement requirements on the bakery industry has concluded that present abatement costs have been low, a practical result of the mild effluent flow and low volume of waste discharge; estimates range from .01 to .02 cents per pound in bread and related products to 5 to 9 cents per pound in the biscuit and cracker industry. To meet existing standards it is probable that bakery firms will choose higher sewage costs rather sewage costs rather than construct their own facilities using expensive urban-suburban land. An examination of the industry shows a multiplicity of plant anf firm sizes primarily located according to the population

density, no plant producing more than 4% of the industry's output. Little or no economic impact is foreseen in employment, dislocation, regional trends, international trade, prices and profits as a result of present abatement requirements. Future abatement cost increases hinge on potential tertiary treatment requirement, odor control requirements and increased electricity costs reflecting new environmental standards. The potential welfare implication of increased bakery prices arising from new standards may show that the cost of meeting such standards in the bakery industry falls disproportionately on the poor. THE EXTERNALITIES OF A TORREY CANYON SITUATION; AN IMPETUS FOR CHANGE IN LEGISLATION,
McCarty and Noone, Washington, D.C.
H. J. McGurren.
Natural Resources Journal, Vol 11, No 2, p 349-371, 1971. 7 fig, 26 ref.

Descriptors: *Oil pollution, *Costs, *Legislation, *Compensation, Oil spills, Insurance, Equity, Regulation, Penalties(Legal), Water pollution control.
Identifiers: *Liability, Externalities.

In developing legislation satisfactorily dealing with equity and efficiency arising from oil spills, the questions to be resolved are: who should bear the cost, what amounts should be expended to prevent or cleanup spills, and what mechanism should be used. Efficiency conditions require that the marginal benefit from preventing or cleaning up spills equal the additional cost. At present, shippers do not consider these costs in their production decisions, creating efficiency questions. The shippers' equity in not paying the cost of oil spills also arises. A historical review of existing statutes reveals a continued reliance on court imposed penalties as a mechanism to solve these efficiency and equity questions. The cost of discovering the benefits and costs of reducing or cleaning up oil spills has lead the courts to rely on single penalties, resulting in inefficient cost curves. As an alternative, the imposition of strict liability and compulsory insurance is suggested, and graphically shows to lead to an efficient outcome. The inclusion of compulsory insurance is a remedy to compensate for existing liability limitations of a shipper's assets. The 1970 Water Quality Act includes both of these elements. (Schroeder-Wisconsin)

THE PROCEEDINGS OF A NATIONAL SYMPOSIUM ON COSTS OF WATER POLLUTION CONTROL.
North Carolina Research Triangle Universities, Raleigh; and Environmental Protection Agency, Washington, D.C.
Available from North Carolina Water Resources Research Institute, Raleigh, N.C. 27607, for $8.00 prepaid. Symposium held on April 6-7, 1972, Raleigh, North Carolina, published by Water Resources Research Institute, North Carolina University. 276 p, 35 fig, 56 tab, 35 ref.

Descriptors: *Environment, *Economic impact, *Pollution abatement, Waste water treatment, Water pollution control, Effluents, Municipal wastes, Industrial wastes, Water pollution, Air pollution, Capital costs, Operating costs, Regulation, Costs, Benefits, Investment, Treatment facilities, Federal government, Cost-benefit analysis, Pollution taxes(Charges), Population, Planning, Water quality standards, Social aspects, Federal Water Pollution Control Act, Model studies.
Identifiers: Cost effectiveness, Joint industrial-municipal waste treatment systems, Pollution control equipment, Effluent charge, Economic incentives, Surcharge, Zero discharge.

This proceedings of a national conference 'Costs of Water Pollution Control' contains twenty-one papers. The central issue was whether pollution abatement should be accomplished by zero discharge ligislation or by some form of economic feasibility approach. In general, the zero discharge approach was considered impractical. Ultimately the degree of pollution abatement would be dependent upon the public's willingness to pay. Pollution problems are concentrated and equal levels of treatment may not be required in all areas of the country, population growth considerations and modular construction should be used more in the treatment facility planning process, pollution abatement cost evaluations h ve placed too little emphasis on benefits and too much on costs, and cost effectiveness should be a prime guideline in pollution abatement planning. The capability of the economy to pay cleanup charges was examined. The degrees of cleanup and associated costs are illustrated. Municipal and industrial waste disposal was considered in terms of treatment facilities, equipment, and capital and operating costs as well as the question of separate industrial treatment plants versus joint municipal-industrial plants. Also included were methodologies to assess cost effectiveness design and management practices, economic impact, economic feasibility, surcharges and economic incentives. ECONOMIC IMPLICATIONS OF ALTERNATIVE NATIONAL POLICIES FOR WATER POLLUTION CONTROL,
Environmental Protection Agency, Washington, D.C. Planning and Evaluation Branch.
R. Luken, and M. Pisano.
In: Proceedings of a National Symposium on Costs of Water Pollution Control, April 6-7, 1972, Raleigh, North Carolina, p 29-47. 1 fig, 9 tab.

Descriptors: *Water quality, *Waste water treatment, *Expenditures, *Economic impact, Water pollution, United States, Effluents, Environmental control, Capital, Marginal costs, Municipal wastes, Industrial wastes, Treatment facilities, Regulation, Standards.
Identifiers: Clean Water Program.

The Environmental Protection Agency uses a three dimension index of pollution, called the PDI index, which considers the prevalence, duration and intensity of pollution. Using this index it was found that pollution problems are concentrated rather than universal and that equal levels of treatment may not be required in all areas of the country. Also, the PDI data supports controlling non-traditional pollution points sources. The marginal cost of pollution treatment rises rapidly as higher levels of treatment are achieved. The total cost of municipal waste treatment facility construction is estimated at $18.1 billion by EPA through fiscal 1976, while an estimate derived from an evaluation of data from the Municipal Waste Inventory for 1971 is $14.3 billion. The cost of pollution control investment for the industrial sector is estimated to range between $8.1 and $12.2 billion. All costs for attainment of effluent standards for the industrial sector amount to a cash outlay of $20 billion for the period 1968-1976. Since EPA is interested in meeting its stated objectives at the lowest possible costs, cost effectiveness and the efficient use of resources are stressed. A possible cost minimizing alternative is a national effluent charge. (See also W74-0562[illegible] (Pinsky-Wisconsin)

ECONOMIC IMPLICATIONS OF ALTERNATIVE NATIONAL GOALS,
National Wildlife Federation, Washington, D. C.
T. L. Kimball.
In: Proceedings of a National Symposium o Costs of Water Pollution Control, April 6-7, 197 Raleigh, North Carolina, p 48-56.

Descriptors: *Economics, *Environmen *Pollution abatement, *Costs, Water pollutio Capital, Federal government, Air pollution, Cos benefit analysis, Surveys, Social participation.
Identifiers: *Opinion polls, Goals.

There are two choices in terms of alternative n tional goals, zero pollution, or that amount of po lution control which is economically feasibl There is neither the capital nor the public suppo for the former, so the real question is: What economically feasible. This will not be decided b economists, but by how much the average citize will pay to clean up the environment. The public concerned about the environment, with a 196 Harris Public Opinoin Poll indicating that four o of five Americans are either concerned or deepl concerned about the environment. The Nation Wildlife Federation determined that a reasonabl clean up program would require an investment c $10.2 billion annually (or $170 per family) for fiv years, while the pollution damage would ever tually be reduced by $22.2 billion annually. Ap proximately half of those interviewed in a surve favored paying the $170 per family to clean up po lution now and save money in costs eventuall Another consideration of alternatives, the Club o Rome study, indicates that the policy makers an scientific community should study whether e ponential growth is the only means to achievin progress and maintaining economic stability. Descriptors: *Environmental engineering *Treatment facilities, *Costs, *Economic feasibili ty, Pilot plants, Mathematical models, Compute models, Waste water treatment, Surveys, Con struction, Management, Pollution abatement Federal Water Pollution Control Act.
Identifiers: *Cost effectiveness, Clean Water Pro gram, Construction management.

Social benefits commensurate with the Clea Water Program are only possible if cost effectiv design and management practices are followed Optimal solutions to environmental engineering problems are developed by the following steps: (1 Listing feasible, effective solutions; (2) Prelimina ry assessment of relative economies and impracti cal solutions; (3) Verification of feasibility remaining solutions are not in common use; (4 Economic comparison of remaining alternative on the basis of generalized costs; (5) If selection

not clear-cut, vigorous functional and cost comparison of few remaining alternatives; (6) Avoidance of unnecessarily high factors of safety and of unnecessary embellishments during final design; and (7) Selection of optimum capacity-design periods for facilities based on representative discounting rates, economy-of-scale parameters and patterns of expected demand increase. Pilot plants, computers and mathematical models, industrial waste surveys, and construction management are useful tools in this approach. While the elimination of all pollutants in the waterways by 1985 is theoretically possible, its implementation, as proposed in the Federal Water Pollution Control Act, would require expenditures of more than $316 billion. The 95 to 99 percent pollutant removal level would cost only $118 billion indicating that the cost effectiveness of the program should be evaluated. (See also W74-05629) (Pinsky-Wisconsin)

THE PRESENT AND FUTURE MARKET FOR POLLUTION CONTROL EQUIPMENT,
Business and Defense Services Administration, Washington, D.C. Water Resources and Engineering Services Div.; and Bureau of Domestic Commerce, Washington, D.C.
K. L. Kollar, and R. Brewer.
In: Proceedings of a National Symposium on Costs of Water Pollution Control, April 6-7, 1972, Raleigh, North Carolina, p 158-167.

Descriptors: *Equipment, *Water pollution control, *Investment, *Economic prediction, Construction, Waste water treatment, Costs, Environmental control, Treatment facilities, Marketing.
Identifiers: Pollution control equipment.

The Council of Environmental Quality and the EPA estimate the direct costs of cleaning up the environment to be $105 billion between 1970 and 1975, with water pollution control costs increasing from $3.1 to $5.8 billion annually. These figures, while large, are not beyond the capability of the national economy. Most of the money to be spent for pollution control is for construction rather than equipment. Of total wastewater expenditures, only 5.4 percent consists of pollution control equipment, with that figure rising to about 12 percent for water supply treatment plants. An evaluation of the backlog, obsolescence, depreciation, future growth, and feasible market indicates that a $30.0 billion municipal construction program may be expected to be completed by 1980. Using the same information, the industrial market would be $11.8 billion for this same time period. This results in a total water pollution control market between 1971-1980 of $41.8 billion for construction and $5.7 billion for equipment. (See also W74-05629) (Pinsky-Wisconsin)
W74-05636

POLLUTION CONTROL POLICY AND THE EFFICIENT ALLOCATION OF RESOURCES,
Council of Economic Advisors, Washington, D.C.
A. K. McAdams.
In: Proceedings of a Symposium on Costs of Water Pollution Control, April 6-7, 1972, Raleigh, North Carolina, p 172-187. 2 fig, 3 tab.

Descriptors: *Cost-benefit analysis, *Pollution abatement, *Economic impact, Cost-benefit ratio, Water pollution, Air pollution, Effluents, Marginal costs, Gross National Product, Inflation, United States, Pollution taxes(Charges), Market value, Costs, Benefits.

Pollution control costs are looked at in order to determine if the United States can afford pollution control. It would cost $60 billion between 1972 and 1982 to remove 87 percent of the pollutants from water, while removing the next 10 percent would cost $60 billion more, and the final 3 percent an additional $200 billion. These figures suggest marginal costs which rise exponentially. A study indicates that with the pollution control costs currently mandated, the rate of growth in real GNP would decline by $6 billion annually versus the base line average, and this minor amount could be offset by appropriate monetary and fiscal policies. Inflation is shown to be unaffected by pollution control expenditures, though it would rise 0.26 percent annually if fiscal or monetary offsets were instituted. Thus, the U.S. can afford pollution control. In order to meet the pollution control question in practice, the private decision maker should be guided to take actions which benefit himself and automatically benefit society. This can be done by setting a fee for the creation of pollutants which would be equal to benefits derived by the removal of those pollutants. This would internalize pollution costs and more efficiently allocate resources. (See also W74-05629) (Pinsky-Wisconsin)

ECONOMIC INCENTIVES IN WATER POLLUTION CONTROL,
Bowdoin Coll., Brunswick, Maine. Dept. of Economics.
A. M. Freeman.
In: Proceedings of a National Symposium on Costs of Water Pollution Control, April 6-7, 1972, Raleigh, North Carolina, p 188-200.

Descriptors: *Economic efficiency, *Effluents, *Water pollution control, *Pollution taxes(Charges), Air pollution, Federal government, State governments, Cities, Marginal costs, Environment, Costs, Regulation, Law enforcement, Pollution abatement.
Identifiers: *Effluent charge, *Economic incentives, Subsidies, Waste discharge.

A shift in government pollution control policy toward a program based on economic incentives and away from one based on regulation, enforcement and subsidy is advocated. The present policy has two elements. It provides federal subsidies to cities for the construction of waste treatment plants, and it regulates effluent discharges and enforces these regulations through the courts. The subsidy aspect has been unsuccessful due to lack of planning, the absence of necessary incentives to cities, and the perverse incentives to firms which lead to wasted resources. The regulation/enforcement aspcet has also been unsuccessful, for it is basically a lengthy bargaining process between polluters with great interest and regulators representing a diffused public. The recommended policy would put a price on environmental resources. With a charge made for the discharge of wastes, polluters would have an incentive to reduce discharges to the environment. Polluters would determine their level of discharge based on the marginal cost of eliminating the effluent versus the charge. The residual charge should be set at a level which limits discharge to that consistent with acceptable levels of air and water quality. An effluent charge policy would be both more efficient and more effective than the present regulation-enforcement policy. (See also W74-05629) (Pinsky-Wisconsin)
W74-05638

WATER AND WASTEWATER SURCHARGES AS ECONOMIC INCENTIVES,
North Carolina State Univ., Raleigh. Dept. of Economics.
J. A. Seagraves.
In: Proceedings of a National Symposium on Costs of Water Pollution Control, April 6-7, 1972, Raleigh, North Carolina, p 201-209. 2 fig, 1 tab, 3 ref.

Descriptors: *Waste treatment, *Water pollution control, *Pollution taxes(Charges), Effluents, Sewers, Institutions, Industrial wastes, Cities, Elasticity of demand, Permits, Costs, Benefits, Textiles, Pulp and paper industry, Chemical industry, Food processing industry.
Identifiers: *Economic incentives, *Surcharge, Transferable permits.

Many cities have added a surcharge, based on the strength of industrial wastes, to water and sewer bills. Using data from four high-polluting industries, food processing, textiles, chemical and pulp and paper, an equation (T=86-14.6 S) was derived relating industrial wastes per $1000 of value added in manufacturing (T) to the amount of the surcharge (S). It was also found that a one percent increase in the surcharge is associated with an 0.8 percent decline in wastes and a 0.6 percent decline in water usage. A one percent increase in the price of water is associated with a 1.0 percent decrease in industrial wastes and a 0.7 percent decrease in industrial water usage. The surcharge is typically set at the city's estimated cost of treating wastes. This method is shown to result in a net benefit to society. An alternative method based on transferable effluent permits would allocate a property right, yet it would still force industry to recognize the opportunity value of reducing wastes. This method would reduce wastes, but it would not restrict a municipality's ability to attract or maintain industry, as a surcharge might. (See also W74-05629) (Pinsky-Wisconsin)

OIL ACCUMULATOR,
Massachusetts Inst. of Tech., Cambridge. (assignee).
J. B. Nugent.
U.S. Patent No. 3,768,656, 3 p, 3 fig, 10 ref; Official Gazette of the United States Patent Office, Vol 915, No 5, p 1717, October 30, 1973.

Descriptors: *Patents, Oil spills, *Oil pollution, *Pollution abatement, Water quality control, Water pollution control, Separation techniques.
Identifiers: *Accumulators(Oil).

The oil accumulator comprises a floatable box which is open at the top and bottom. The stern is closed and the bow is open. Appropriately located with the box is a ramp designed so that when a wave with oil on its surface enters the box, it is caused to surge up the ramp and spill over it. The oil is trapped within the box but the water is free to exit through the open bottom. Accumulators are inserted at appropriate intervals in the boom systems which, in turn, are arranged to channel the oil into the accumulators. (Sinha - OEIS)

APPARATUS FOR REMOVING OIL AND OTHER FLOATING CONTAMINANTS FROM A MOVING BODY OF WATER,
J. W. Strohecker.
Available from NTIS as PAT-APPL-203267, $3.00 paper copy, $1.45 microfiche. Atomic Energy Commission Patent Application Serial No. 203,267(70), November 1971. 12 p, 4 fig.

Descriptors: *Patents, *Skimming, *Oil pollution, Oil spills, *Pollution abatement, Water quality control, *Flotsam, *Separation techniques.

This skimming system uses the natural gravitational flow of water. It consists of a diversion boom positioned diagonally across a stream and in registry with the surface of the latter for intercepting and diverting floating contaminants into a weir. The weir is located in the stream bank upstream from but adjacent to the downstream end of the boom. The weir is ballasted so that the contaminants are directed through or over the weir. The contaminants then are conveyed through a conduit and discharged into a retention basin which contains an under flow weir. The boom is designed to adapt to changing water level. (Sinha - OEIS)

WASTE DISCHARGE PERMITS: NO DEFENSE TO WATER POLLUTION ACTIONS,
Lewis and Clark Coll., Portland, Oreg. Northwestern School of Law.
A. E. Staines.
Environmental Law, p 181-188, Winter 1971. 37 ref.

Descriptors: *Legal aspects, *Water pollution, *Water pollution control, *Water policy, *Public rights, Permits, Legislation, *Oregon, Water, Water pollution sources, Abatement, Pollution abatement, Non-structural alternatives, Water quality, Water quality control, Water quality standards, Water resources.
Identifiers: Injunctive relief, Nuisance(Legal aspects).

Under Oregon law, public interest in maintaining pollution-free waters prohibits a waste discharge permit from being employed as a defense in a state abatement pro specifications. A new section of this statute provides that any permit to build aceeding or prosecution for water pollution. Such a permit is equally ineffective as a defense in a private injunctive suit or damage action for water pollution. Since permits can confer no greater rights than the law itself grants, and since the law prohibits water pollution, discharge permits cannot authorize such pollution. Accordingly, issuance of such a permit does not sanction any nuisance which results from polluting acts. Oregon law provides that the state has title to the land below a navigable river's high water line. The state also owns all water sources. Since water pollution is prohibited, to allow such pollution is to permit an illegal private use of public property. Since an administrative agency possesses only those powers expressed in its enabling act, a waste discharge permit allowing water pollution is void as beyond the agency's powers over public property. REGULATIONS CONCERNING WASTE DISCHARGE REQUIREMENTS, NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM.
California State Water Resources Control Board, Sacramento.
May 1973. 42 p.

Descriptors: *California, *Waste discharge, *Permits, *Water quality control, *Administrative agencies, Water quality, Water control, Water policy, Standards, Regulations, Federal government, State governments, Pollutants, Environmental sanitation, Waste disposal, Pollution sources, Industrial wastes, Agricultural wastes, Cities, Treatment facilities, Water law, Legal aspects, Water resources development, Conservation, Ecological impact, Legislation.

The Waste Discharge Requirements of the National Pollution Discharge Elimination System (NPDES) for California, as authorized by the California Administrative Code are described. The regulation of water is carried out by the State Water Resources Control Board, and nine regional Water Quality Control Boards. Waste discharge requirements (permits) are adopted for each individual discharger, to protect water quality. Each contains limits on the quality of the effluents and specifies conditions to be maintained in the receiving waters. Monitoring is required, especially where concentrations of substances critical to downstream beneficial uses can be expected to vary greatly. No waste discharge requirements will be issued if: the discharge contains a radiological, biological or chemical warfare agent; or high level radioactive waste; such would substantially impair anchorage or navigation; or the federal administrator objects in writing. Permits are required for municipal treatment plants, agricultural facilities and industrial discharges. California standards must be within the bounds of those outlined by the administrator of the Environmental Protection Agency and subject to their regulation. (Silber-Florida)

AMERICAN WATERWAYS: FLORIDA OIL POLLUTION LEGISLATION MAKES IT OVER FIRST HURDLE,
Oregon Univ., Eugene. School of Law.

'. N. Swan.
ournal of Maritime Law and Commerce, Vol 5, Vo 1, p 77-110, October 1973. 199 ref.

)escriptors: *Florida, *Legislation, *Pollution ontrol, *Legal aspects, *Water law, Water quali-y, Water quality control, Water resources, Water olicy, Judicial decisions, Shores, Beaches, Oily vater, Pollutants, Polllution effects, Standards, legulation, State governments, Vessels, Ports, Harbors, Facilities, Structures, Navigable waters,)ceans, Sea water, Federal government, Licen-es, Permits, Standards, Navigation, Pollution ef-ects, Pollution abatement.

The 1970 Florida Oil Spill Prevention and Pollution Control Act deals with measures to reduce the likelihood of accidental spills as well as with civil obligations to compensate those harmed by the scaped oil or other pollutants. The Act applies to erminal facilities in Florida's ports and to ships estined to or leaving such facilities. The United States Supreme Court in Askew v. American Waterways Operators upheld Florida's right under he police power to impose liability in damages for osses suffered by both the state and by private in-erests. Attacked on the basis that it would be un-uly burdensome to interstate commerce, the Court found ample enabling power in the Tenth Amendment and various other decisions holding hat states are often in the best position to protect he health and welfare of their own citizens. The Florida statute is designed to serve five basic pur-oses: to confer licensing authority; to regulate the leliverance and transference of hazardous materi-ls; to establish a compensation-and-control-ex-ense fund; to make terminal operators and car-iers strictly liable for pollution damage; and to nake them responsible for removing escaped pol-utants. (Silber-Florida)
W74-05778

NO FAULT LIABILITY FOR OIL POLLUTION DAMAGE,
S. Bergman.
ournal of Maritime Law and Commerce, Vol 5, Vo 1, p 1-50, October 1973. 194 ref.

)escriptors: *Pollution control, *Pollution abate-nent, *Water law, *Water policy, *Legislation, Water quality, Water quality control, Water esources development, Pollutants, Pollution ources, Pollution effects, Shores, Beaches, Coastlines, Oceans, Sea water, Legal aspects, Standards, Regulations, State governments, Federal government, Project purposes, Planning, Water management, Water development, Indus-ry, Vessels, Ports, Harbors.

The imposition of liability regardless of fault on all oil-bearing tanker vessels, for all public and rivate property and commercial damage resulting rom any accidental oil spill occurring adjacent to he coast is advocated. The magnitude and intensi-y of maritime oil pollution problems today, apacity to deal with accidental spills, and what to nticipate in the technological future are lescribed. Past and present legislative assaults on ccidental polluters is outlined. The imposition of bsolute liability is proposed as a solution and arious legal and economic bases for so doing are xamined. The conclusion seeks to respond to ossible practical challenges to the feasibility of mplementing the proposal of absolute liability. Silber-Florida)

INTERNATIONAL IMPACT REPORTS AND THE CONSERVATION OF THE OCEAN ENVIRONMENT,
Syracuse Univ., N.Y. Coll. of Law.
. F. E. Goldie.
Natural Resources Journal, Vol 13, No 2, p 256-81, April 1973. 80 ref.

Descriptors: *Oceans, *Sea water, Development, *Long-term planning, *Pollution control, *International law, *International agreements, Mining, Effluents, Pollutants, Water resources, Water resources development, Water management, Water law, Legal aspects, Judicial decisions, Water policy, Water utilization, Water demand, Water control, Federal government, Environmental effects, Environmental sanitation, Conservation.

It has been suggested that one way to assure proper management and minimal adverse effects to undersea development, such as mining, would be to extend the requirement of impact studies and the permit system now used in the United States. Among the aspects to be considered in development of ocean resources is whether there will be any adverse environmental effects, or any irreversible or irretrievable commitment of resources. International interests must also be recognized and a worldwide agreement as to some conservation and environmentally protective policy must be reached to prevent wholesale raping of the ocean's wealth. Legislation analogous to the National Environmental Policy Act of 1970 (NEPA) is desirable to preserve and enhance the resources and prevent degradation to the oceans. Some references are made to litigation involving the NEPA to illustrate the judicial construction given to various provisions of the Act for future applications. Focusing on 'rights and amenities' and the nature of the obligation of full disclosure the courts recognize that among all of those competing interests, some practical solution must emerge to preserve these same resources for future generations. SUPERIOR-MICHIGAN-HURON-ERIE-ONTARIO: IS IT TOO LATE,
G. Young.
National Geographic, Vol 144, No 2, p 147-185, August 1973. 17 photo.

Descriptors: *Great Lakes, *Bodies of water, *Lake beds, *Inland waterways, *Recreation, Lake Erie, Lake Huron, Lake Michigan, Lake Ontario, Lake Superior, Lake breezes, Freshwater, Thermal properties, Self purification, Water levels, Lake shores, Lake fisheries, Lampreys, Aquatic life, Waste disposal.

Of the five Great Lakes only Lake Superior, the largest, has shown no increase in dissolved solids during a 60 year period. The lower Great Lakes are being sorely stressed by the cities, farms, and industries lining their shores, and by the polluted rivers flowing into them. Demographers predict that a complex of cities will ring Lakes Erie and Ontario and most of Lake Michigan causing pollution problems to increase. An extensive tour of the Great Lakes is described and many of the pollution problems facing them as well as some possible solutions are discussed. These solutions are immensely complex, for many sources of pollution and many jurisdictional units are involved. (Comfort-Florida)

PROPOSED CHATTOOGA NATIONAL WILD AND SCENIC RIVER, NORTH CAROLINA, SOUTH CAROLINA, AND GEORGIA (FINAL ENVIRONMENTAL IMPACT STATEMENT).
Forest Service (USDA), Washington, D.C.
Available from the National Technical Information Service, Springfield, Va, 22151, as EIS-NC-73-0589-F, for $4.25 paper copy, $1.45 microfiche. (1973). 58 p, 1 map, 2 photo.

Descriptors: *Environmental effects, Environmental control, Growth rates, Rivers, *Regulation, Management, Water policy, Vegetation, Georgia, South Carolina, North Carolina, Land use, *Wild River Act, Recreation, *Southeast U.S.
Identifiers: *Environmental impact statements, Jackson and Macon Co. N.C., Rabun Co. Ga., Oconee Co. S.C.

The Chattooga River flows through North Carolina, Georgia, and South Carolina. The proposal provides the means for protecting the river and adjacent lands from adverse environmental effects. The impact of increased recreational use will be controlled through regulations based on the carrying capacity of the river and land rather than on demand. The region around the river contains a rich variety of plant life, including a mixed composition of timber. In general, the immediate environment of the Chattooga is fragile, and overuse could result in deterioration and destruction of some of its unique plant life and aesthetic quality. The alternatives considered for the river's protection are: taking no action; development of the river for hydropower; and protection of the river through designation as a Federally administered river in the National Wild and Scenic Rivers System. FEDERAL COMMON LAW IN INTERSTATE WATER POLLUTION DISPUTES,
R. J. Trompeter.
University of Illinois Law Forum, Vol 1973, No 1, p 141-161, 1973. 145 ref.

Descriptors: *Pollution control, *Pollution abatement, *Judicial decisions, *Legal aspects, *Water law, Legislations, State governments, Federal government, Water rights, Water policy, Water control, Water management, Standards, Regulations, Cooperation, Pollution sources, Pollution effects, Environmental effects, Pollutants, Rivers, Streams, Lakes, Navigable waters, Water demand.

Since air and water pollutants never respect state boundaries, numerous lawsuits in which one state has sought abatement of polluting sources in another state have been heard since the turn of the century. Two questions become implicit. What demands are reasonable, and how is a state to make and enforce these demands. The Federal Water Pollution Control Act gave primary responsibility for control of water pollution to the states. This procedure was entangled with complex committees, conference and hearings and no party could find relief for at least a year after filing their complaint. In addition to being inefficient and time consuming, the Act's standards were wholly inadequate to deal with interstate pollution controversies. Each state could set its own standards or as some called them--'licenses to pollute.' Emerging from the ineptness of the Act, states have been invoking the original jurisdiction of the Supreme Court and contending that 'federal common law' must rule the substantive issues of the cases. In declining in Illinois v. Wisconsin to do so, on other grounds, the Supreme Court has recognized this 'federal common law' as a viable device to attack and solve interstate pollution disputes. APPARATUS FOR REMOVING OIL AND OTHER FLOATING CONTAMINANTS FROM A MOVING BODY OF WATER,
Atomic Energy Commission, Washington, D.C. (assignee)
J. W. Strohecker.
U.S. Patent No. 3,779,385, 4 p, 4 fig, 7 ref; Official Gazette of the United States Patent Office, Vol 917, No 3, p 960, December 18, 1973.

Descriptors: *Patents, Oil spills, *Oil pollution, *Pollution abatement, *Flotsam, *Skimming, Separation techniques, Water pollution control, Water quality control, Equipment, Weirs.

Floating contaminants such as oil and solid debris are removed from a moving body of water by employing a skimming system which utilizes the natural gravitational flow of the water. A boom diagonally positioned across the body of water diverts the floating contaminants over a floating weir and into a retention pond where an underflow weir is used to return contaminant-free water to the moving body of water. The floating weir is ballasted to maintain the contaminant-receiving opening so that it is slightly below the surface of the water during fluctuations in the water level. This permits skimming the contaminants with minimal water removal. (Sinha-OEIS)
W74-05881

OIL RECOVERY SYSTEM,
Bridgestone Tire Co. Ltd., Tokyo (Japan). (assignee)
T. Muramatsu, K. Aramaki, and Y. Kondo.
U.S. Patent No. 3,771,662, 5 p, 7 fig, 9 ref; Official Gazette of the United States Patent Office, Vol 916, No 2, p 538, November 13, 1973.

Descriptors: *Patents, Oil spills, *Oil pollution, *Pollution abatement, Water pollution control, Water quality control, Separation techniques.
Identifiers: *Oil fence, Oil films.

An oil fence assembly includes an elongated belt having two parallel longitudinal edges each of which can flex in a longitudinal direction. A flexible float, preferably tubular, connects to the belt so as to extend in the longitudinal direction of the belt. The U-shaped oil fence is moved on the water surface so as to sweep the spilled oil into an area defined between two leg portions. An oil-collecting zone is formed in the U-shaped oil fence line, where all the oil films swept thereby are collected to form a comparatively thick oil film. The oil may be removed from that zone. (Sinha-OEIS)

DYNAMICALLY EFFECTIVE OIL-GUIDE-BOOM AND METHOD FOR PURIFYING WATER EMPLOYING THE SAME,
H. R. Steltner.
U.S. Patent No. 3,779,382, 4 p, 3 fig, 3 ref; Officia Gazette of the United States Patent Office, Vo 917, No 3, p 959, December 18, 1973.

Descriptors: *Patents, Oil spills, *Oil pollution *Skimming, *Water purification, *Pollution abate ment, Water quality control, Water pollution con trol.

An oil-guide-boom which is effective in th removal of surface oil and residue from flowin water is disclosed. The boom includes two suppor members and a sheet extending between the sup ports in a trough-like manner. The sheet comprise a wire mesh material and a non-woven fabric. I operation the boom is placed in water toward th direction of flow so as to allow water to pas through the mesh portion of the sheet and to col lect in the trough portion of the sheet. The boon has particular utility in that its structure an materials allow continuous removal of surface im purities from flowing water. Method of purifyin water containing oil on the surface which utilize the oil-guide-boom is also disclosed. (Sinha-OEIS W74-05888

VORTEX OIL-WATER SEPARATOR SYSTEM PROVIDING CLEAN WATER,
United Aircraft Corp., East Hartford, Conn.
D. P. Miller.
U.S. Patent No. 3,780,865, 5 p, 5 fig, 2 ref; Officia Gazette of the United States Patent Office, Vo 917, No 4, p 1327, December 25, 1973.

Descriptors: *Patents, *Oil pollution, *Pollutio abatement, *Separation techniques, Equipment.
Identifiers: Ballast, Bilge water, *Vortex separa tor.

A vortex separator is used to separate a mixture o materials of different densities, such as an oil water mixture, into two components. The mixtur is injected tangentially into one end of a cylindrica chamber at a high flow rate to impart a swirl to th flow in the chamber. Clean or recirculated water injected into the chamber from the opposite en wall. The separated water is exhausted from th chamber through a port in the center of the en wall containing the water injectors, and th separated oil is exhausted through a small duc located at the center of the water exhaust port Two or more separators may be connected in se ries for applications in which a ship's ballast o bilge water is separated into a first componen containing primarily oil which can be stored in small volume, and a second component of sub stantially pure water which may be dumped over board. A baffle plate may be added in the chambe to improve the separation process. (See also W74 05894) (Sinha-OEIS)

ONVERTIBLE BARRIER FOR SUBSTANCES LOATING ON WATER,
. Preus, and J. J. Gallagher.
.S. Patent No. 3,783,621, 3 p, 7 fig, 4 ref; Official azette of the United States Patent Office, Vol 18, No 2, p 577, January 8, 1974.

escriptors: *Patents, *Oil spills, *Oil pollution, quipment, *Pollution abatement, Water quality ontrol, Water pollution control, Separation chniques.

barrier adapts to contain oil slicks under any ater condition. It consists of liquid pervious and quid impervious skirts. The liquid impervious kirt is deflected at currents greater than about one not and the oily substances are treated with a par- culate oleophilic hydrophobic substance less ense than water for retention by the liquid pervi- us skirt. The barrier comprises a flotation collar ith the skirts depending from it in parallel-planar, extensive relationship. The flotation collar may e an inflatable tube or it may be made of a flota- le material such as polystyrene or polyethylene am, or an oleophic-hydrophobic material. inha-OEIS)

IETHOD AND SYSTEM FOR THE CONTAIN- IENT AND SALVAGE OF CHEMICALS AND ILS AT SEA,
. L. Gambel.
.S. Patent No 3,783,622, 7 p, 8 fig, 8 ref; Official azette of the United States Patent Office, Vol 18, No 2, p 577, January 8, 1974.

Descriptors: *Patents, *Oil spills, *Oil pollution, *Chemical wastes, Barriers, *Pollution abatement, Water quality control, Water pollution control, Equipment, Separation techniques.

Rigid barrier units are deployed around a surface area of a body of water which is to be enclosed in order to contain an oil spill or a chemical contaminant. Each unit is provided with adjustable buoyancy and ballasting chambers so that a nearly neutral buoyancy condition can be established. A substantial mass of the unit rests below the turbulence level of the water. The units are linked by hinge sections positioned at the ends of each unit and are mounted to move relative to their respective barrier units about horizontal axes that are perpindicular to the main longitudinal axis of the barrier unit. Hinge sections can be coupled to provide for pivotal movement about a common vertical axes. (Sinha-OEIS)

6. WATER RESOURCES PLANNING

6A. Techniques Of Planning

A SELECTED ANNOTATED BIBLIOGRAPHY ON THE ANALYSIS OF WATER RESOURCE SYSTEMS, FOURTH VOLUME.
Office of Water Resources Research, Washington, D.C.
Available from the National Technical Information Service as PB-229 894, $9.75 in paper copy, $1.45 in microfiche. Water Resources Scientific Information Center, Report WRSIC 73-218, December 1973. 490 p, 323 ref.

Descriptors: *Systems analysis, *Bibliographies, Water resources, *Optimization, *Simulation analysis, Operations research, Abstracts, Alternative planning, *Management, *Planning, Evaluation.

An annotated bibliography containing 323 abstracts is presented of selected publications issued in 1971 and 1972 pertaining to the application of systems analysis techniques for defining and evaluating alternative solutions to water resource problems. The first two volumes of this bibliography, having the same title, were published by the Cornell University Water Resources and Marine Sciences Center, Ithaca, New York (Publication 25, August 1969; Publication 35, June 1971); the third volume was published by the Water Resources Scientific Information Center in December 1972. Both subject and author indexes are provided. Descriptors are listed with each abstract. The abstracted material emphasizes the application of optimization and simulation techniques for assisting in the planning and management of water resource systems.

APPLICATION OF MICROECONOMIC MODELS TO REGIONAL ENVIRONMENTAL QUALITY MANAGEMENT,
Resources for the Future, Inc., Washington, D. C.
C. S. Russell.
American Economic Review, Vol 63, No 2, p 236-243, 1973. 22 ref.

Descriptors: *Model studies, *Environmental effects, *Decision making, Costs, Economic impact, Environmental control, Standards, Regional analysis, Mathematical models.
Identifiers: *Microeconomic models, Ambient quality standards, Steepest ascent method.

Microeconomic models presently used to examine environmental quality problems generally concentrate on the costs of reducing or modifying discharges. Such models are designed to find the most efficient way of meeting exogenously given standards for either discharges or ambient quality. The choice between the two is the result of potential policy choices of the public agency, number of sources for which discharge reduction cost function need be developed, and the complexity of the environmental model used. Models currently being developed at Resources for the Future (RFF) are similar to earlier models that were subject to ambient standards. These RFF models are divided conceptually into three parts: one dealing with discharge, production and consumption activities; a second transforming discharges into ambient conditions; and a third, comparing ambient conditions to standards or entering them into damage functions. RFF models are distinguishable from classical forms as they deal with all waste forms and their interactions simultaneously. Activities are also extremely flexible, allowing non-constant cost and input and process substitutions. Information is also generated on the distribution of impacts from potential environmental management decisions. Solutions are found in newly developed RFF models using essentially the steepest ascent method, found primarily in non-linear programming. (Schroeder-Wisconsin)

ALTERNATIVE WATER RESOURCE SYSTEMS IN THE LOWER MEKONG,
Economic Commission for Asia and the Far East (UN), Bangkok (Thailand).
K. Chaemsaithong, L. Duckstein, and C. C. Kisiel.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 100, No HY3, Paper 10430, p 461-475, March 1974. 3 fig, 2 tab, 28 ref.

Descriptors: *Water resources development, *River basin development, *Asia, Cost-benefit analysis, Economics, Hydroelectric power, Flood control, Mathematical models, Optimization, *Alternative planning.
Identifiers: *Lower Mekong Basin.

A systematic method is given for evaluation of alternative water resources systems with particular reference to the development of water resources in the Lower Mekong Basin. In the evaluation process, the development goals that may be of an

economic or social nature are explicitly stated and transformed into specifications. The approach requires that distinct alternatives be sought and compared using both quantitative and qualitative criteria. A decision to select an alternative can be reached by use of a fixed-cost or fixed-effectiveness approach. Sensitivity analysis in the approach takes into account uncertainty in hydrologic and economic data. (Knapp-USGS)

MASTER PLANNING METHODOLOGY FOR URBAN DRAINAGE,
Rice (Leonard) Consulting Water Engineers, Denver, Colo.
H. F. Bishop.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 100, No HY1, Paper 10290, p 189-199, January, 1974. 4 fig, 12 ref.

Descriptors: *Planning, *Urban hydrology, *Urban runoff, *Water reuse, Data collections, Data processing, Urban drainage, *Flood control, Systems analysis, Water management(Applied), *Colorado.
Identifiers: *Denver(Colo).

Effective operation and maintenance of the urban environment requires the coordinated management of the various elements of the urban area. One of the principal elements of the urban system is that of water resource management which includes urban drainage and flood control. A systems engineering methodology was developed for master planning of the major drainage system in the Denver area under Project REUSE (Renewing the Environment through Urban Systems Engineering). The methodology incorporates a functional description of the urban drainage system and a systematic process of data acquisition, runoff analysis, concept identification and selection, and master plan development and implementation. MULTIPLE-OBJECTIVE OPTIMIZATION IN WATER RESOURCE SYSTEMS,
Purdue Univ., Lafayette, Ind. Dept. of Electrical Engineering.
V. Vemuri.
Water Resources Research, Vol 10, No 1, p 44-48, February 1974. 2 fig, 1 tab, 8 ref.

Descriptors: Water resources, *Planning, *Management, *Optimization, *Methodology, Equations, Reservoir storage, Reservoir releases, Mathematical models, Systems analysis.
Identifiers: *Multiple-objective optimization, *Noninferior solutions, Auxiliary scalar optimization.

Multiple-objective optimization problems arise naturally in resource management projects. A chief difficulty with multiple-objective optimization is that it is no longer clear what one means by an optimal solution. A possible remedy to this situation is to refine the concept of 'optimal solution' by introducing the so-called 'noninferior solution set.' Then optimization, in a multiple-objective context, boils down to determining the set of noninferior solutions. Determination of the noninferior set is facilitated by relating it, in a one-to-one manner, to a family of auxiliary scalar optimization problems. For a certain class of problems the entire noninferior set can be obtained by solving the auxiliary scalar problem. This procedure is illustrated, considering the problem of determining the optimum storage capacity of a reservoir subject to a specified set of release rules. For demonstration purposes, some simplifications are made. The applicability of this method is presently restricted to the use of a particular functional form for each vector index and no constraints. Further research is needed to extend this method to more general forms of performance indices and to problems in which decision and state variable constraints are present. (Bell-Cornell)

WATER ALLOCATION MODELS BASED ON AN ANALYSIS FOR THE KISSIMMEE RIVER BASIN,
Florida Univ., Gainesville. Dept. of Food and Resource Economics.
J. E. Reynolds, J. R. Conner, K. C. Gibbs, and C. F. Kiker.
Available from the National Technical Information Service as PB-229 636, $5.00 in paper copy, $1.45 in microfiche. Florida Water Resources Research Center, Gainesville, Publication No. 26, 1973. 147 p, 19 fig, 22 tab, 36 ref, 3 append. OWRR B-005-FLA(4), OWRR B-007-FLA(12). 14-31-0001-3069, 14-31-0001-3267.

Descriptors: *Water allocation(Policy), Water values, Water utilization, Water demand, Decision making, Model studies, *Simulation analysis, *Florida, *Water distribution(Applied), *Alternative water use, Linear programming, *Mathematical models, Water policy, Operations.
Identifiers: Water allocation models, *Kissimmee River basin(Fla), *Operational policy.

Two types of models for allocating water among alternative uses and between watersheds in the Kissimmee River Basin were developed and empirically evaluated. The value of water in agricultural and recreational uses was estimated for use in the allocation models. A linear programming model of the hydrologic-economic system was developed to determine the economic consequences of broad operational policy alternatives and the relative trade-offs based on economic returns from water allocation among different uses, locations and time periods. A simulation model that incorporated hydrologic and physical relationships for the basin was evaluated as an alternative type of water allocation model. The two different types of water management models evaluated in this study can serve different purposes. The simulation model, because of its detailed approach, is best suited for developing and evaluating specific operational policies for individual basins. The linear programming model is better suited for assessing effects of broad operational policy alternatives and for determining optional choices. This study demonstrated the feasibility and usefulness of water management system modelling as a means of providing information for selecting water management policy alternatives. (Morgan-Florida)

AN ANALYTICAL INTERDISCIPLINARY EVALUATION OF THE UTILIZATION OF THE WATER RESOURCES OF THE RIO GRANDE IN NEW MEXICO: MIDDLE RIO GRANDE REGION,
New Mexico State Univ., University Park. Dept. of Agricultural Economics.
R. R. Lansford, S. Ben-David, T. G. Gebhard, Jr., W. Brutsaert, and B. J. Creel.
Available from the National Technical Information Service as PB-229 671, $4.50 in paper copy, $1.45 in microfiche. New Mexico Water Resources Research Institute Report No. 022, Partial Technical Completion Report, 1973. 99 p, 14 fig, 36 tab, 1 append, 67 ref. OWRR A-045-NMEX(3).

Descriptors: *New Mexico, Water resources, *Water demand, Economics, *Alternative water use, *Water resources development, *Management, *Economic prediction, *Surface-groundwater relationships, Natural resources, Water requirements, Resource allocation, River basins, Groundwater management, Water law, Interstate compacts, International compacts, Treaties, Litigation, Water quality, *Water utilization, Human population, Employment, Industrial water, Recreation, Water management(Applied), Linear programming, *Rio Grande River.
Identifiers: *Socioeconomic models, Groundwater appropriation, Input-output coefficients, Surface-groundwater conjunctive use model, Economic land classification, Groundwater models, Irrigation water diversions.

An interdisciplinary approach to the solution of the water resource problems of the Middle Rio Grande Region in New Mexico was centered around a socio-economic model, with special emphasis placed upon the Rio Grande Region. Inputs into the socio-economic model were obtained from separate studies. Three sets of alternatives were considered: (1) Without a water constraint, in the Rio Grande Region, both production and depletions are expected to exhibit the largest increase (59.7 percent and 47.4 percent, respectively); (2) When a surface water constraint is imposed, the value of production is reduced by $18.1 million in 2020 and water depletions are expected to decrease about 18.1 percent by 2020; (3) When a total water constraint is imposed, the value of production is decreased $4.1 million below that expected when using only a surface water constraint, and water depletions reduced about 8.4 percent. The Middle Rio Grande Region is expected to follow the general trend of the total Rio Grande region but at a higher growth rate. The expected increase in total value of production from 1970 to 2020 is 62.0 percent, employment 62 percent, and water depletions about 61 percent. When a surface-water constraint is imposed, production is expected to be reduced $3.2 million in 2020, employment by 154 employees, and water depletions by 51,633 acre-feet. When an additional constraint is imposed on ground water in the MRGR, produc-

on would be decreased $2.0 million in 2020, employment by an additional 99 employees, and water depletions by 38,390 acre-feet. (Hain-New Mexico)

NEW DIRECTIONS IN U.S. WATER POLICY--SUMMARY, CONCLUSIONS AND RECOMMENDATIONS FROM THE FINAL REPORT OF THE NATIONAL WATER COMMISSION.
National Water Commission, Arlington, Va.
Available from GPO, Washington, D.C. 20402 Price $2.50. Summary of National Water Commission Final Report to the President, House of Representatives and Senate, 1973. 197 p, 4 append.

Descriptors: *National Water Commission, Water resources development, *Water law, Governments, Water policy, Water transfer, Economics, Water costs, Water utilization.

The National Water Commission, created by Act of Congress in 1968 to review national water resources problems, submitted its report and recommendations to the President and the Congress on June 15, 1973. Because the full report is a document of nearly 600 pages, a summary is presented for those who do not wish to take the time to read the complete report. Water is one of many resources that must be managed prudently for the national good. Prudent management requires the pursuit of sound economic policies to increase national wealth and of wise environmental policies which promote the health and happiness of the people and protect the life-supporting ecological systems of the earth. Institutions and procedures must be adequate to the task of identifying policy questions, of analyzing the issues on an information base broad enough to predict results, and then of making decisions. The legal system must provide the means of implementing policy decisions while protecting the rights of individuals. In particular, there is need to modernize laws dealing with groundwater. Up until very recently insufficient attention has been given regulation of groundwater as part of the total water resource, and as something which should be closely coordinated with regulation of surface waters. Not only is groundwater a major source of water supply for agriculture, industry, and municipalities, it is susceptible to pollution which can be even more serious than pollution of surface waters. Development, management, and protection of water resources should be controlled by that level of government nearest the problem and most capable of effectively representing the vital interests involved. Regional and State entities, as well as local units of government, should assume increasing roles in the control of water resources use and preservation. (See also W73-12052) (Knapp-USGS)

MEASURING THE INTANGIBLE VALUES OF NATURAL STREAMS, PART II, PREFERENCE STUDIES AND COMPLETION REPORT,
Kentucky Water Resources Inst., Lexington.
J. A. Dearinger, G. M. Woolwine, C. R. Scroggin, D. R. Dolan, and J. S. Calvin.
Available from the National Technical Information Service as PB-229 838; $14.00 in paper copy, $1.45 in microfiche. Research Report No. 66, December 1973. 207 p, 52 fig, 15 tab, 10 append. OWRR B-015-KY(2). 14-31-001-3086.

Descriptors: *Aesthetics, Psychological aspects, Scenery, Value, *Intangible benefits, Intangible costs, Conservation, Environmental effects, Recreation, Regional analysis, Planning, *Kentucky, Attitudes, *Motivation, *Behavior, Regression analysis, Evaluation, Wild rivers, *Natural streams.
Identifiers: *Psychometric analysis, Uniqueness concept, Scenic rivers.

This report describes the work done during Part II of a project which had as its aim the development of a way to quantify those intangible values peculiar to a small stream and its watershed. Part I was concerned with an application of the 'uniqueness concept' in the evaluation of a fifty-eight Kentucky streams. The results of this effort are in Report Number 40, U.K. Water Resources Institute (1971), (See W71-11859). During the second part of the project: (1) A method was developed whereby peoples' preferences for natural landscapes could be measured. The method utilized projected color slides and a rating system based on the semantic differential. (2) Fourteen preference studies were conducted using different types of subjects and stimuli (color slides). (3) The data were factor analyzed and scores computed for three factors (Natural Beauty, Force and Starkness) for each slide-subject group combination. (4) The scenic content of each slide was measured and related to the factor scores by a series of linear regression equations. (5) The uniqueness ratio approach was modified to include fewer stream characteristics (thirty-seven) and the work of Part I essentially repeated. (6) A new method of stream evaluation was developed which yields a factor score for a given stream on each of six factors (Scenic Attractiveness, Land Use-Topo, Litter, Aquatic Habitat, Extractive Industry, Development). POPULATION GROWTH, RESOURCE AVAILABILITY AND ENVIRONMENTAL QUALITY,
Resources for the Future, Inc., Washington, D.C.
J. L. Fisher, and R. G. Ridker.
American Economic Review, Vol 63, No 2, p 79-89, May 1973. 1 fig, 2 ref.

Descriptors: *Population, Environment, Natural resources, Technology, *Resource allocation, Model studies, *Mathematical model, Regulation, Decision making, Planning, *Pollution abatement, Social aspects, Gross National Product.
Identifiers: *Environmental quality, *Economic growth, Raw materials, Population growth, Birth control, Resource availability.

The interrelationships of population, resources, and environment are examined in order that more coherent industrial and governmental policies might be formulated to meet environmental problems. Use of a mathematical model of the economy together with a comparison of model results with conventional studies of specific sectors such as agriculture and energy led to the conclusion that the United States is not likely to experience serious shortages of raw materials during the next 30 to 50 years as a result of projected population and economic growth. Population growth becomes more important as the time framework increases, but in the short term, technology, consumer tastes, and public policies have a more important impact on resources and the environment. Direct attacks on pollution problems through an active pollution abatement policy easily dominates over reductions in population and economic growth as a means of obtaining a cleaner environment. Critical elements for any understanding of the population, resources and environment interrelationship include the time horizon of the analysis, the geographic area under consideration, the technological, behavioral and institutional setting, and the composition of production and consumption. The importance of continuously monitoring the interrelationship is shown and a number of the more significant policy directions are noted. (Slattery-Wisconsin)
W74-05614

AN OPERATIONAL MATHEMATICAL PROGRAMMING MODEL FOR THE PLANNING OF ECONOMIC ACTIVITIES IN RELATION TO THE ENVIRONMENT,
Netherlands School of Economics, Rotterdam. Economic Research Inst.
F. Muller.
Socio-economic Planning Sciences, Vol 7, No 2, p 123-137, 1973.

Descriptors: *Environmental effects, *Industrial production, *Mathematical models, *Economic impact, Linear programming, Economic justification, Social impact, Regional economics, Industrial wastes, Input-output analysis, Diffusion, Constraints, Pollution abatement, Investment, National income, Welfare(Economics), Decision making.
Identifiers: *Environmental quality.

Three models are developed to illustrate the effects of increased production on the environment. These models have in common an input-output submodel which relates inputs, outputs, final demand and pollution emissions. Emissions are dispersed throughout the region using a diffusion submodel. This submodel provides decision makers with the impacts of production decisions on any regional sector's environmental quality. In models one and two, the region's contribution to the national income is maximized, subject to any sector's available labor supply and minimum productions standards, using linear programming. The second model limits the concentration of each pollutant within every sector. Duals, which yield the marginal benefits gain from the relaxation of environmental constraints, are ranked and compared with the investment costs necessary to reduce emissions. Model three possesses a non-linear objective function, constraints, and explicitly considers the changes in investments. A step-wise method is developed to solve this problem. All models allow a number of pollution abatement practices to be incorporated including changes in production levels, production processes, input substitutions, locational changes, abatement investment and recycling. Input-output, pollution and diffusion data are necessary to operate each model. (Schroeder-Wisconsin)

COMPETING VALUES IN WATER DEVELOPMENT,
Committee on Interior and Insular Affairs (U. S. Senate). Subcommittee on Water and Power Resources.
D. A. Dreyfus.
Journal of the Hydraulics Division, Proceedings of the American Society of Civil Engineers, Vol 99, No HY9, p 1599-1604, 1973. 4 ref.

Descriptors: *Social values, *Social participation, *Future planning(Projected), Division making, Resources development, Water resources, Environment, Attitudes, Alternative planning.
Identifiers: *Resource management.

Nowhere else in the United States' public sector have changing societal values been as pronounced as in the rejection of existing resource management concepts. These value changes have been exacerbated by the exponential growth of the American economy and the growing environmental movement, a growth which has forced a number of critical resource management decisions. Previously resource managers have applied the utility concept to planning by extrapolating basic indicators, such as GNP, into the future then mechanically converting these into the demand for products and services. The projected need is considered a justification and mandate for action and plans are made to fulfill such projections. Critics of this approach contend that projected increased demands are not inevitable, not do they reflect public choice; indeed such projection may induce self-fulfilling prophesies. Even when the needs are real, the utility approach fails to consider alternative management plans which may have less objectionable side effects. An alternative management strategy would utilize a desired rather than projected future and alternative plans would be ranked according to their ability to meet desired outcomes. The discovery of desired futures would imply greater citizen participation which in itself may make the public sector responsive to evolving social values. (Schroeder-Wisconsin)
W74-05620

PARKLAND PLANNING AND LAKE MANAGEMENT IN THE ROCK RIVER BASIN.
Wisconsin Univ., Madison. Inst. for Environmental Studies.
IES Report 14, November 1973. 49 p, 2 fig, 1 tab, 41 ref.

Descriptors: *Recreation, *Parks, *Comprehensive planning, Lakes, Rehabilitation, Watershed(Basins), *Wisconsin, Decision making, Community development, Urbanization, Institutions, Financing, Land use, *Management, Reclamation, Carp, Riprap, Zoning, *Regional analysis.
Identifiers: Jefferson County(Wis.), Lake Koshkonong(Wis.), *Rock River basin(Wis.), *Environmental Impact Statements.

Actual resource management problems within the context of local or regional planning and administration considers Lake Koshkonong, Wisconsin improvement and its problems and possibilities, together with development of Jefferson County recreation parklands. After reviewing the problems and proposed alternatives in Lake Koshkonong, only the riprap program and improved zoning action is endorsed at this time. The study of parkland planning and development policy in Jefferson County, Wisconsin considers how much parkland is needed and what are the appropriate acreage and activity standards; who should pay for the acquisition, development, and maintenance of the county park system; to what extent should new park areas be developed; what land classifications should and should not be used for recreation; and whether stronger recreational regulatory authorities and expanded administrative investments are needed to maintain quality parkland and recreational facilities. State and federal ligislation and procedures available to counties for making environmental impact assessments are outlined. Guidelines for preparing and reviewing environmental impact statements are provided and suggestions are given for raising environmental questions in local project planning even when environmental impact statements are not formally required, with examples based on Jefferson County. 75 WATER ASSESSMENT. DRAFT PLAN OF STUDY.
Water Resources Council, Washington, D. C.
July 1973. 52 p, 6 fig, 2 tab.

Descriptors: *Water supply, *United States, *Assessment, Water demand, *Evaluation, Water resources, *Planning.
Identifiers: Water Resources Council, 1975 water assessment, Study plan.

The plan for the assessment of the nation's water supplies by the Water Resources Council is prepared in order to identify existing and emerging water and related resource problems, judge their severity and their urgency for resolution by various governmental actions. The assessment format is carefully described. The initial step is the development of a range of potential water requirements based on a set of regional and national projections of economic activities (OBERS). Next, an evaluation is made of imbalances between current (1975) water supplies and future requirements. Two separate studies will be conducted: the first analyzes the problem on a national basis, the second to pinpoint specific problem areas not covered in the national study. Information gathered in this second step will be compiled to show the economic, social, and environmental impacts of projected deficiencies. Using this information for Step 3, the National Programs and Assessment Committee and regional sponsors' selected judges will rank the severity of these deficiencies according to a consistent set of criteria to be developed. Ranking will be shown in a draft report soliciting public response. Step 4 recommendations will involve identifying problems having the greatest national interest and suggesting appropriate future federal roles. (Schroeder-Wisconsin)

AQUACULTURE: ECONOMIC FEASIBILITY IN THE GREAT LAKES AREA,
Wisconsin Univ., Madison. Dept. of Agricultural Economics.
W. D. Dobson.
In: Proceedings of Fourth National Sea Gran Conference, October 12-13, 1971, Madison Wisconsin, 1225 West Dayton Street, Sea Gran Program, University of Wisconsin, Madison, p 89 98. 3 tab, 15 ref.

Descriptors: *Aquiculture, *Fish, *Great Lakes *Economic feasibility, Water pollution, Effluents Catfishes, Perches, Trout, Shrimp, Thermal pollu tion, Pikes, Powerplants, Demand, Marketing.
Identifiers: Japan, Great Britain, Chub, Advertis ing.

Despite its economic potential to Great Lakes are processors, capital will not flow into aquacultur until certain economic and technical problems ca be solved. One primary problem is to keep wate heating costs down. Problems such as lack o available research information, supply of brood stock, and availability of low cost credit, could b solved through a program of public assistance t aquaculture growers. While aquaculturall produced fish will be easier to market an merchandise than wild fish, the demand for fis may grow slowly unless a strong advertising an promotional program is implemented. Currently i the planning or experimental stage is the use o thermal discharges for aquaculture. Included ar several catfish raising experiments in the Unite States, as well as shrimp and yellowtail experi ments in Japan, and successful experimental worl in Great Britain. While problems exist in the use o thermal discharge for fish raising, experimental in formation suggests that economically viabl systems of this type might be developed. A viabl aquacultural industry, which would includ adequate demand for fish products, could aid th continued economic growth of the Great Lakes re gion. (See also W74-05644) (Pinsky-Wisconsin)

COMPATIBILITY OF PETROLEUM ACTIVITIES IN THE COASTAL ZONE,
Humble Oil and Refining Co., Houston, Tex.
J. R. Jackson, Jr.
In: Proceedings of the 24th Annual Session Gul and Caribbean Fisheries Institute, Novembe 1971, Rosenstiel School of Marine and At mospheric Science, University of Miami, Cora Gables, Florida, p 48-55, 1972. 7 fig.

Descriptors: *Water resources development, *Oi industry, *Coasts, Natural resources, Optima development plans, Compatibility, Tourism, Fish ing, Gulf of Mexico.
Identifiers: *Coastal Zone management.

The relation between oil consumption and GNI and regional economic development is presente as evidence of the strategic importance of the oi industry in maintaining our current standard of liv ing and its future improvement. The compatibilit of oil resources development and other coasta resources such as fish and recreation is described It is pointed out that diverse activities can coexis in harmony if the concept of compatible use is ap plied in their management. The compatible us concept is a flexible framework of use priorities ir which long-term social and economic benefits ar maximized. If one use is paramount, other use should be permitted to the extent that they do no interfere with the dominant use. Possible un reasonable interferences are considered an shown to be insignificant. escriptors: *Inter-basin transfers, Water sources development, Political aspects, olitical constraints, *Canada, Social aspects, nvironment, Governments, *Water law, Conser-tion, *Institutional constraints.
entifiers: *Protectionism(Area of origin).

ublic interest has focused so completely on oposals for inter-regional and international ter diversion, few have noticed the effective position to them put forth by those areas with e most to lose. No area of streamflow origin in e North American West has ever parted willingly th its water. Area-of-origin motivations, past ccesses in state statutes and interstate com-cts, strategies employed in and out of Congress, d prospects in the continuing struggle are scussed. No better example of protectionist ategy exists than that of the Pacific Northwest ates in successfully opposing legislation provid-g for studies of means to augment the water sup-ies of the Colorado Basin. The two-pronged ef-rt of Northwestern leaders--to reorganize and ose divisions in their own ranks at home while king advantage of national sentiment for conser-tion and comprehensive planning to counteract version proposals in Congress--is followed in tail. Federal and provincial jurisidctions in nada are explored. Analogies with the sale of her Canadian resources across the international rder are found not to be very relevant, given the onger environmental context of water. (Knapp-SGS)

HE MANAGEMENT OF WATER IN EN-LAND AND WALES: THE CASE FOR EFORM,
epartment of the Environment, London ngland).
E. Beddoe.
own and Country Planning, Vol 40, No 9, p 405-1, September, 1972. 2 fig.

escriptors: *River basin commissions, *Water anagement(Applied), Water resources, *Water ilization, Water supply, Water demand, Water nservation, Water quality, Rivers, Environmen-l control, Sewage disposal, Sewage treatment, aste water treatment, Water pollution control.
entifiers: *Regional water authorities(Gr. itain), Central Advisory Water Committee(Gr. itain).

iver management and water services provision in reat Britain have developed in the last 100 years probably the best standards in the world. Effi-ent water management is essential since ex-oitable water is scarce, resources are heavily ed, rivers are small, and inland water exists in nall proportions. Studies predict future needs to uble present supplies. Rivers will be relied upon stead of just groundwater or water piped from land storage. Water quality, equally as impor-nt as quantity, links waste removal and new urce development into comprehensive manage-ent. In the past, water uses were separated, but e Trent Model Research Programme shows that treating rivers as a system, an optimal solution, cluding water treatment, sewage disposal, and ver management, is attained at lower cost than ith separated functions. The Central Advisory ater Committee reported comprehensive water anagement should exist for each river basin, to administered by multi-purpose authorities. Ten thorities will be established to provide water and claim or dispose of used water, considering navigation, recreation, drainage, defense, and conservation needs. A National Water Council is proposed to provide central water-related services. (Grden-North Carolina)

LAKE NORMAN DEVELOPMENTAL IMPACT STUDY,
North Carolina Univ., Chapel Hill. Center for Urban and Regional Studies.
R. J. Burby, III, T. G. Donnelly, and S. F. Weiss.
Prepared for Centralina Council of Governments and Lake Norman Marine Commission, June, 1972. 121 p, 3 fig, 25 tab, 3 append.

Descriptors: *Lakes, *Recreation facilities, *Comprehensive planning, *Urbanization, Shore protection, Non-structural alternatives, Water pollution, *Land use, *North Carolina.
Identifiers: *Lake Norman(N.C.), Residential development, Participation rates.

Lake Norman in the Central Piedmont area of North Carolina has been a major recreational and residential resource since its creation in 1963. While present development is scattered, much of the shoreline has been committed to future intensive residential, commercial, and industrial use. The area will gradually shift from its presently rural environment to an increasingly urbanized one. Concomitant with this are the dangers of environmental degradation and the loss of recreational amenities. Problems of residential and resource utilization of the lake are analyzed. The amount and location of residential growth between 1970 and 1981 are forecast. The recreation environment is examined in terms of potential demand until 1981 and involves discussion of market area population, participation rates, and the relative accessibility of Lake Norman. An inventory and evaluation of existing recreational facilities and a projection of additional facilities needed by 1981, and identification of potential problems and conflict situations stemming from both residential and recreational uses are presented. Potential problems include water pollution, solid waste disposal, public access, residential quality, public safety, and conflicting water surface uses. Recommendations for policies and actions to maintain environmental quality and enhance recreational opportunities are: (1) develop a comprehensive land use plan; (2) preserve open space and land for public recreation; (3) promote compact development; (4) alleviate the threat of lake pollution; (5) improve the quality of development; (6) control litter and unauthorized dumping; (7) control vandalism and theft; and (8) control power transmission line routes. THE LAND WATER INTERFACE IN AN URBAN REGION: A SPATIAL AND TEMPORAL ANALYSIS OF THE NATURE AND SIGNIFICANCES OF CONFLICTS BETWEEN COASTAL USES,
Washington Univ., Seattle. Div. of Marine Resources.
P. Harrison.
Available from the National Technical Information Service as COM-73-11257; $5.25 in paper copy, $1.45 in microfiche. PhD Dissertation. 1973. 181 p, 20 tab, 8 fig, 157 ref. NOAA SG-1-72.

Descriptors: *Earth-water interfaces, Coasts, *Management, *Land use, *Urbanization, *Washington, Shores, Regional economics, Natural resources, Water utilization, Bodies of water, Environment, Model studies, Methodology.
Identifiers: *Puget Sound(Wash), *Coastal zone management, Sea Grant Program.

A framework for empirical analysis of changing coastline use in an urban area is provided. Growth of coastal activities is described, the role of common property resources in generating negative externalities is analyzed, and classifications developed are tested in the Puget Sound region of Washington. Coastal activities are divided into commercial and non-commercial sectors, and a shift to non-commercial activities in an advanced regional economy is hypothesized. Commercial activities produce a final demand good, and non-commercial activities are sites used by consumers, such as marinas. Twenty water-related activities are analyzed and result in support of the hypothesis. This shift is also relected in higher prices paid for shoreline location for non-commercial activities. The hypothesis that commercial activities generate competing coastal uses with negative effects felt by non-commercial activities is rejected, since non-commercial activities generate and receive a greater proportion of critical conflicts. Effects of land-use conflict upon regional political structure and spatial distribution of coastline activities are examined. For example, the shift to non-commercial activities, characterized by loosely coordinated groups, will probably result in more permanent groups to protect their interests. (Grden-North Carolina)

ENVIRONMENTAL QUALITY PLANNING - GOALS, POLICIES, AND OBJECTIVES.
East-West Gateway Coordinating Council, St. Louis, Mo.
Available from the National Technical Information Service as PB-222 097; $3.25 in paper copy, $1.45 in microfiche. Final Report. June, 1973. 18 p, 1 fig, 1 append. 3.8. Mo. P-198.

Descriptors: *Comprehensive planning, Environment, *Environmental effects, *Environmental control, Water policy, Water resources development, Land development, Land management, Land resources, Land use, Natural resources, *Missouri, Pollution, Air, Air environment, Air pollution, City planning.
Identifiers: *St. Louis(Missouri), *Environmental quality planning, Environmental goals, Environmental policies, Environmental objectives, Environmental protection.

Formation of environmental quality goals is the first phase of a comprehensive approach to environmental quality problems in the St. Louis, Missouri, region. Scope of environmental quality planning is delineated in the natural environment with systems of air, water, land, and plant and animal life which interact with each other and with man. Preliminary goals, policies, and objectives are established and are subject to continual refinement as programs progress. The general goal for environmental planning is a healthful, attractive, and ecologically sound environment which optimally supports the needs of citizens in the St. Louis region. Objectives include establishing a planning process, environmental enhancement and protection, and continuous evaluation. Water goals include regional water resources sufficient in quantity and quality to meet needs of the area and to support wildlife and to be used for human consumption. The goal for air resources is to reduce levels of air pollution in order to anticipate and prevent threats to human health and well-being. Development and use of land commensurate with the land's physical capabilities, and preservation of land in its natural state where possible, is the goal set for land use. (Grden-North Carolina)

A USEFUL THEOREM IN THE DYNAMIC PROGRAMMING SOLUTION OF SEQUENCING

AND SCHEDULING PROBLEMS OCCURRING IN CAPITAL EXPENDITURE PLANNING,
Northwestern Univ., Evanston, Ill. Dept. of Industrial Engineering and Management Sciences.
T. L. Morin, and A. M. O. Esogbue.
Water Resources Research, Vol 10, No 1, p 49-50, February 1974. 4 ref.

Descriptors: *Capital, *Expenditures, *Planning, *Theoretical analysis, Water resources, *Scheduling, *Dynamic programming, Optimization, Systems analysis, Mathematical models, Equations.

The management of capital expenditure planning continues to encounter problems that tempt the water resource planner to use complete enumeration, but the magnitude of such problems often defies the use of these direct methods. Direct transfer is neither feasible nor wise, and consequently, the establishment of a strong analytic base for this transfer is both necessary and useful. The dimensionality of certain sequencing and scheduling problems can be reduced by exploiting their special structures. An example of this type of reduction of dimensionality is presented in the form of a theorem. The use of the theorem in the dynamic programming solution of a previous example is discussed. Sufficient conditions for the optimality of a myopic decision rule are also shown to be a special case of the theorem. (Bell-Cornell)

ECONOMIC GROWTH VS. ENVIRONMENTAL PROTECTION: WHAT WILL BE THE OUTCOME,
Wisconsin Univ., Madison. Dept. of Economics; and Wisconsin Univ., Madison. Dept. of Agricultural Economics.
J. Steinhart, R. Lampman, and W. Lord.
Proc available from the National Technical Information Service as COM-73-10115, $3.00 in paper copy, $1.45 in microfiche. In: Proceedings: Fourth National Sea Grant Conference, University of Wisconsin, Madison, Sea Grant Publ. WIS-S6-72-112, p 49-60, October 1971.

Descriptors: *Pollution abatement, *Economic efficiency, Environmental control, Market value, Social values, Regulation, Decision making, Governments, Costs, Benefits.
Identifiers: *Externalities, *Economic growth, Price system.

Economists differ from ecologists in terms of their ultimate goals and the means to achieve these goals. Economic growth is the goal of the economist, and includes production of both commodities and services. The benefits of growth can be directed towards the ecologist's goal of improving and preserving the environment. However other claims, such as the elimination or reductio of poverty, the control of crime, and the elimina tion of discrimination, also exist for these sam benefits. Economists use the price system yieldin optimal amounts of pollution, in contrast to th policy of governmental regulation favored b ecologists. A major problem in utilizing the pric system in this manner, however, is the effects o externalities. Externalities are third party effect which are not adequately measured in the mark place. Thus a polluter does not feel the real cost o his actions. Public ownership and regulation, an assigning property rights to all aspects of th economy are suggested as ways of dealing with th issue. Future research ought to identify and evalu ate externalities, and get them into the decisio making process. Effluent charges, for exampl would give the social cost of pollution and allo polluters to measure this cost against the benefits. (See also W74-05645 thru W74-0565((Pinsky-Wisconsin)

ECONOMICS OF AQUACULTURE DEVELOI MENT,
Hawaii Univ., Honolulu. Sea Grant Program.
J. R. Davison.
In: Proceedings of Fourth National Sea Grat Conference, October 12-13, 1971, Madisor Wisconsin, 1225 West Dayton Street, Sea Grat Program, University of Wisconsin, Madison, p 7. 82. 3 ref.

Descriptors: *Aquiculture, *Economics, Evalu. tion, Agriculture, Feasibility studies, *Cost *Profit, *Hawaii.
Identifiers: Sea Grant, Subsidies, Interdisciplina cooperation, Aquiculture development.

There is sufficient promise of benefits derive from aquiculture to justify not only present inves ment, but a massive effort to develop it. The ne work of services, money subsidies, and cost-pric controls which presently exist in agriculture, hav not yet been established for entrepreneu pioneering in aquiculture. While aid is now avail ble from the Sea Grant Advisory Service in twel states, there still is not the backlog of informatic or scientific manpower and skills that is availab to agriculture. This deficiency has slowed th development of aquiculture. However, progre could be accelerated by the combination of avail. ble skills in terrestrial animal and plant scienc with those who already understand the aquatic lif processes. Economists can contribute through th assessment of costs and returns, thus aiding th development of a viable, profit-making enterpris Projects which inject economic input into ongoir studies of aquiculture are currently being co ducted at the University of Hawaii. This type c cooperation is essential if aquiculture is to b raised to near its potential in several years rath than several generations. (See also W74-0564 (Pinsky-Wisconsin)

isibility.
entifiers: Sea Grant, Animal sciences, Joint pro-
ams.

hile the green revolution will result in increased
mpetition for aquaculture from animal protein,
growth in the world's population will severely
ain the capability of land areas to nourish man-
d. The extent to which ocean pollution can be
rbed will very much determine whether the
rld's protein needs can be supplied in part
ough aquaculture. Aquaculture must become
face intensive, highly automated, and of a luxu-
kind in order to compete effectively with ter-
trial animal protein. The phases which a species
st go through before they can be put into com-
itive aquacultural production include: (1) spe-
s selection, (2) biological research, (3) field tri-
, and (4) assessment of socio-economic factors.
nt industry-government aquacultural research
erations, as well as cooperative research by land
imal scientists and aquatic biologists, would be
eful. Such research should use system models in
der to determine the true potential of aquacul-
re and the means of achieving that potential.

PUBLIC WATER SUPPLIES OF NORTH CAROLINA: PART I. NORTHERN PIEDMONT,
Geological Survey, Raleigh, N.C.
N. M. Jackson, Jr.
North Carolina Office of Water and Air Resources, raleigh, July 1972. 277 p, 4 fig, 5 ref.

Descriptors: *Water supply, *North Carolina, *Hydrologic data, *Data collections, Water utilization, Water quality, Municipal water, Industrial water, Domestic water, Water resources development.

Information on the water resources and inventories of the public water supplies is compiled for 18 counties in the northern Piedmont section of North Carolina. The information should be useful to planners and water managers concerned with water-supply availability, water-resources development, and water quality. The method of investigation, the information reported for each water supply and its significance to planning, chemical analyses included in the report, and some of the problems noted during the investigation are discussed. A water-resources appraisal and a map of each county show the general area served by public water supplies and an inventory of each public supply in the county with 500 or more customers. The appraisal includes the population served, the adjacent communities served, the number of metered customers, the source of water, estimated allowable draft, total and industrial water use, raw and finished water storage, raw and finished water-pumping capacity, future plans, a water-resources appraisal in the immediate vicinity of the supply, and the results of chemical analyses of raw and finished water. WATER SUPPLY PROBLEMS AND FUTURE RESOURCES,
Water Resources Board, London (England). Research Div.
P. G. O'Neill.
Town and Country Planning, Vol 40, No 9, p 412-418, September, 1972. 1 photo.

Descriptors: *Water sources, *Water utilization, *Water management(Applied), Water resources, Water demand, Water conservation, Water delivery, Water quality, Water requirements, Surface water availability, Groundwater, Reservoirs, Desalination, Estuaries, Water treatment, *Water reuse, *Waste water treatment.
Identifiers: *Metropolitan Water Board(Gr. Britain), London(England).

A shift from construction to management of water resources, plus a corresponding emphasis on water and effluent treatment rather than provision of additional water sources, is occurring in Britain. Traditionally, water supplies were derived from boreholes in aquifers, but groundwater levels fell for 150 years before the process was arrested. River water was used, but pollution necessitated development of reservoirs in upland valleys. Most reservoirs are of the direct-supply type, yet increased demand for water has led to treatment of water for reuse. Study concerning guidelines for operating sluices to maintain water flow but to provide maximum storage is progressing. The use of radar is feasible to predict rainfall affecting water supply. Other considerations in reservoir regulation include use of gravity or pumped inflows and ecological consequences of management. Another source, groundwater, usually biologically pure, could help maintain river flows in dry years, and artificial recharge of aquifers from river water could be undertaken. Estuarial storage schemes are also proposed, as is desalination of sea water. Due to complexity and cost of the process, desalination could be justified only if no future surface or groundwater source development was possible. (Grden-North Carolina)

PROTECTION OF PUBLIC WATER SUPPLY.
Pa. Stat. Ann., secs. 691.1 thru 691.8 (1970).

Descriptors: *Pennsylvania, *Administrative agencies, *Water pollution sources, *Industrial wastes, Sewage effluents, Project planning, Permits, Regulation, Legislation, Water conservation, State governments, Recreation, Economic aspects, Aesthetics, Watershed management, Water supply, Waste water treatment, Water resources development, Conservation, Water utilization, Water quality, Public health, Environmental engineering.
Identifiers: *Administrative regulations, *Nuisance(Legal aspects).

It is a public nuisance to discharge sewage, industrial waste, or any substance into Pennsylvania waters which contributes to or causes pollution.

Unpolluted streams in the state are essential in the attraction of new industries, and in the development of the tourist industry. Clean water is also necessary to meet the demand for increased outdoor recreational facilities. In other words the prevention and elimination of water pollution is directly tied to the state's economic future. A comprehensive program of watershed management and control is needed. The Pennsylvania Sanitary Water Board is authorized to adopt regulations and to issue orders or permits to implement the statutory objectives. The Board should consider water quality management and pollution control in the watershed, present and possible future uses of particular waters, feasibility of combined or joint treatment facilities, the state of scientific and technical knowledge, and the immediate and long range economic effects. They are also responsible for the development and implementation of water supply and waste management plans. All fines, civil penalties, application fees, and permit fees will go into the Clean Water Fund to be used by the Board for the elimination of pollution. (Sperling-Florida)

Identifiers: *Administrative regulations.

The board of commissioners of any county may obtain funds to expend on the acquisition, construction, operation, and maintenance of dams, reservoirs, and wells. The purpose of these structures is the utilization of surface, subsurface and ground water resources. Sites for these structures may also be acquired through the power of eminent domain. This board must obtain a permit from the Pennsylvania Department of Environmental Resources when such a permit is required. The board may enter into agreements for the regulation and sale of withdrawals and diversions of waters from the facilities with the approval of the state or federal agency with jurisdiction over the water resource. Facilities obtained by the board may be for any purpose except the generation of electric energy. The board is authorized to enter into contracts or agreements with any state or federal agency for the development and use of the county's water resources. It will also be lawful for any county to execute such agreements and contracts to provide for the utilization of water resources. Any county may also contract for the sale of water to any other county, town or public utility at reasonable, uniform rates. (Sperling-Florida)

SIERRA CLUB V. LYNN (ACTION CHALLENGING EIS WHICH FOUND COMMUNITY PROJECT WOULD NOT POLLUTE WATER RESERVOIR).
364 F.Supp. 834-852 (W.D. Tex. 1973).

Descriptors: *Water pollution effects, *Water pollution sources, *Water policy, *Water resources, Judicial decisions, Natural resources, Underground structures, Erection, Buildings, Legislation, Legal aspects, Water law, Water resources development, Federal government, *Texas, Jurisdiction, Land use, Land management, Environmental effects, Alternative planning.
Identifiers: *National Environmental Policy Act, Environmental Impact Statements.

Plaintiffs filed suit against the Department of Housing and Urban Development (HUD), alleging that the development of a new community housing program would violate the National Environmental Policy Act (NEPA). Development is to be staggered over the next 30 years and the proposed site is in virtually an undisturbed natural condition. The court carried out an in-depth review of the Secretary's decision, but stated it could overrule the decision, under the Administrative Procedure Act (APA), only upon a showing of an arbitrary and capricious abuse of discretion. The opinion extensively discussed the applicability of the Urban Growth and New Community Development Act. The court not only felt the Secretary's decisions were sound, but that the project and its land-use controls were an extremely vital vehicle for capturing and controlling growth in a very sensitive geographical area. The opinion discussed the applicability of NEPA to the project and found the EIS sufficient, in that the Secretary had not violated the APA. In discussing the applicability of the Water Pollution Act, the court felt Congress could not improve upon the HUD standards for the protection of the aquifer in question. After the extensive review, the court held the new community should not be hindered as long as HUD imposed controls are maintained and to insure this, the court retained jurisdiction. FLOOD PROBLEMS IN CERTAIN AREAS OF THE HACKENSACK RIVER BASIN; SADDLE RIVER BASIN; PASSAIC RIVER BASIN; AND POMPTON RIVER BASIN--STATE OF NEW JERSEY.
Hearing--Before the Subcommittee on Investigations and Review of the Committee on Public Works, U.S. House of Representatives, 93rd Cong., 1st Sess., February 23, 1973. 162p, 18 photo, 3 map.

Descriptors: *New Jersey, *Federal government, *Financing, *Local governments, *River basin development, *Flood protection, Budgeting, Land management, Watershed management, Streambeds, Flooding, Flood plain zoning, Engineering structures, Backwater, Government finance, Cost sharing, Project planning.
Identifiers: *Congressional hearings.

There is a long history of flooding problems in New Jersey. Land development takes place along the upper reaches of streams and encroachment occurs on the flood plain of the lower reaches until, in many cases, the problem reaches disaster proportions. Improvements in bridges and culver and major channel improvements can alleviate th to some extent. Officers and interested parti from each municipality presented their localize flood problems to the committee. Many of th needed improvements are too expensive for eac city or town to solve completely, so these hearin serve to bring the problems to the attention those in the federal government who can secu federal funds for the project. NEPA IN THE COURTS: A LEGAL ANALYSI OF THE NATIONAL ENVIRONMENTAL POI ICY ACT,
Environmental Law Inst., Washington, D.C.
F. R. Anderson, and R. H. Daniels.
Johns Hopkins University Press, Baltimore, 197
324 p, 1126 ref, 3 append.

Descriptors: *Water resources developmen *Federal project policy, *Environmen *Environmental effects, *Evaluation, Feder government, Judicial decisions, Legal aspect Decision ration, Project purposes, Legislatior Environmental Engineering, Social aspects, Thir party effects.
Identifiers: *Environmental impact statemen *National Environmental Policy Act.

The real heart of the National Environmental Po icy Act (NEPA) is section 102 (2) (C) whic requires all federal agencies to prepare a detaile statement on all actions significantly affecting th quality of human environment. Because th guidelines laid down by the government to impl ment this provision have proved insufficient, th legal points involved have been raised by privat citizens in challenges to government actions, an this has given courts a major role in shaping th meaning of NEPA's 'action forcing' provisio Analysis are presented of the state of the law wit respect to all major issues which have been raise in suits under 102 (2) (C). LAWARE RIVER BASIN COMMISSION: AN- AL REPORT 1973.
laware River Basin Commission, Trenton, N.J.
74. 24 p, 2 map, 29 photo, 3 chart.

scriptors: *Delaware River, *Interstate com- ssions, *Interstate compacts, *Water policy, ?ater resources development, State govern- nts, Administrative agencies, Cooperation, ordination, Planning, Water utilization, Water nand, Water control, Structures, Dams, Reser- rs, Canals, Flood control, Flood prevention, od protection, Environment, Environmental tection, Pollution control, Water management, ter development, Recreation, Project-pur- ses, Industry, Agriculture, Municipalities.

complishments and problems encountered and pending in the Delaware River Basin in 1973 are viewed. Water control projects in the nature of ns and reservoirs have been constructed and re are in the development stages. Recreational continues to be abundant despite the damage urred in the upper portion of the river due to the vy flooding in June of 1973. Flood damage canals constructed to run parallel with the river at certain vulnerable points absorbed a maximum of stress but severe battering occurred to several municipalities despite the presence of such structures. Flood plain controls have reached their first stage completion point with a comprehensive research plan depicting and documenting the flood history of many vulnerable areas along the basin. Various environmental safeguard measures have also been implemented ranging from the creation of an Environmental Unit to coordinate various environmental problems and interstate programs to review the needs and demands of the many water-using operations of industry, agriculture and government along the basin. Water sales and water power capacity and services are also described. (Silber-Florida)

LEGISLATIVE FRAMEWORK FOR WATER RESOURCES MANAGEMENT IN ALABAMA.
Alabama Univ., University. Natural Resources Center.
Available from the National Technical Information Service as PB-224 322 $4.75 in paper copy, $1.45 in microfiche. Prepared for Alabama Development Office, Montgomery, March, 1973. 45 p, 66 ref.

Descriptors: *Alabama, *Water law, *Water resources development, *Comprehensive planning, *Conservation, Long term planning governments, Administrative agencies, Water utilization, Industries, Municipalities, Water allocation, Water distribution, Water demand, Legal aspects, Standards, Regulation, Water control, Water supply, Water quality, Water quality control, Coordination, Cooperation, Legislation.

The necessity of water resource planning for the future is emphasized even though Alabama's present water supply is abundant. Present judicial doctrines narrowly view the regulation of water usage as necessary only when controversy arises, and then on only a case to case basis. Present legal preferences avoid determining the most beneficial community use of water, and planning up until now has received little if any attention. Water must be recognized as a dwindling commodity to be paid for by the industries and municipalities that use and pollute it. Inherent in a long-term planning scheme already operative in many humid eastern states is a system of water allocation and distribution based on development and planning goals. Also essential is the single agency concept, giving one main, statewide agency authority to integrate all planned projects into a state masterplan for water resource development. A review and evaluation are included of existing water resources and planning statutes among the several states, as well as specific constitutional problems which might arise and proposed legislation. (Silber-Florida)
W74-05590

A BILL AUTHORIZING THE CONSTRUCTION, REPAIR, AND PRESERVATION OF CERTAIN PUBLIC WORKS ON RIVERS AND HARBORS FOR NAVIGATION, FLOOD CONTROL, AND FOR OTHER PURPOSES.
House Bill 10203, 93d Cong, 1st sess (1973), 144p.

Descriptors: *Federal government, *Legislation, *Water resources development, *Project purposes, *Water policy, Navigation, Navigable waters, Structures, Facilities, Planning, Flood protection, Flood prevention, Administrative agencies, Power plants, Hydro-electric power, Water management, Water quality, Water quality control, Land use, Land development, Land management, Easements, Ecology, Environment, Environmental effects, Fishlife, Wildlife conservation, Regulations, Wildlife management, Standards, Channels, Pollutants, Disposal, Shores, Shorelines, Banks.

This Bill entitled Water Resources Development Act authorizes the Army Corps of Engineers to design and implement multiple-purpose water resource development projects. The Corps has the duty and resonsibility of constructing, repairing and preserving various public works on rivers and harbors for navigation, flood control and other purposes. The Bill provides for hurricane flood protection and other flood prevention appropriations on a regional basis. Also included are guidelines for hydro-electric power installation sites. In the development of the several projects provided for in the Act, the Corps shall assure that proper provisions are made for fish and wildlife management, including acquisition of necessary lands or environmental easements. Such easements shall prevent the clearing of the subject land for commercial agricultural purposes or any other purposes inconsistent with wildlife habitat. Also among the provisions are directions to the Corps to remove certain sunken vessels which impede navigation and authorization to clear channels of such trees, roots and debris and other objects which impair safe navigation. The Corps is authorized to operate and maintain models to test proposals affecting the environmental quality of the regions, including sanitary intrusion, dispersion of pollutants, water quality, shoreline changes and others. (Silber-Florida)

LIFE OF THE LAND V. BRINEGAR (ACTION TO ENJOIN SEAWARD RUNWAY FOR AIRPORT).
485 F. 2d 460-474 (9th Cir. 1973).

Descriptors: *Federal project policy, *Project planning, *Environmental effects, *Wildlife habitats, *Project purposes, Federal government, Inter-agency cooperation, Judicial decisions, Legal aspects, Administrative decisions, Cost sharing, Legislation, Hawaii, Ecology, Pollutants.
Identifiers: *National Environmental Policy Act(NEPA), Environmental Impact Statements.

After consideration of the record, the court held the necessary environmental impact statement (EIS) had complied with the requirements of the National Environmental Policy Act (NEPA) and also comported with the Airport and Airway Development Act as no feasible alternatives were shown. The court stated that compliance with NEPA relating to the EIS is based on good-faith objectivity rather than subjective impartiality. Plaintiffs urged consideration of measures to protect a rare water bird felt to be endangered by the proposed project, and an alleged failure to comport with the NEPA requirement of alternative proposals. The court found nothing in the record which indicated the project's planners believed that the project would have an irreparably deleterious effect upon the environment, but found various environmental side benefits, such as the reduction of air and water pollution, enhancement of recreational boating facilities and improvement in area fishing. With respect to alternative proposals, the court held there was no need to consider alternatives, the effect of which cannot be reasonably ascertained and where implementation is deemed remote and speculative. The EIS need only set forth those sufficient to permit a reasoned choice. As there was substantial evidence and no arbitrary or capricious action taken, the circuit court affirmed for the defendants. WASTE DISPOSAL.
N.Y. Environmental Conservation Law, sec. 27-0301 (1972).

Descriptors: *Waste water(Pollution), *Water quality, *Water pollution control, *Waste disposal, Waste water disposal, *New York, Sewage disposal, Septic tanks, Sanitary engineering, Natural resources, Water sources, Legisla-

tion, Administration, Water pollution effects, Permits.

The statute deals with private waste disposal and the registration of septic tank cleaners and industrial waste scavengers. No person shall engage in removing or disposing of solid or liquid wastes from domestic sewer systems and treatment facilities or from waste-producing operations of factories or commercial establishments without first obtaining a certificate of registration. This certificate will be issue the Commissioner of Environmental Conservation, and the procedure for obtaining the certificate is set forth. If the Commissioner determines that the applicant's nature and operation of business will be detrimental to the natural resources or environment of the state, he may refuse issuance or impose conditions so as to adequately protect against unreasonable degradation of those resources. The registration certificate requires an annual report to the Commissioner indicating the number and type of installations emptied or cleaned, the volume and nature of wastes disposed and the place and manner in which they were finally disposed. The registration shall be renewed annually, and the Commissioner may suspend or revoke any certificate upon proof that the registrant has been found guilty of violating any of the provisions of the statute. WATER POLLUTION--WASTE DISPOSAL.
N.Y. Environmental Conservation Law, sec. 17-0701, (1972).

Descriptors: *Water pollution, *Water quality, *Water pollution control, *Waste disposal, *Waste water disposal, *New York, Sanitary engineering, Legislation, Administration, Water sources, Water pollution effects, Nuclear powerplants, Hydroelectric plants, Electric power, Ultimate disposal.
Identifiers: *Deep well disposal system.

This statute deals with water pollution control and the permits needed for operation of a disposal system, or the opening of a new sewage outlet. Virtually all types of waste are covered. A project plan for the proposed operation must be submitted to, and approved by, the Commissioner of Environmental Conservation before a permit will be issued. Steam-electric generating facilities and nuclear plants are specifically mentioned. An exception is given to a disposal system which discharges sewage effluent without the admixture of industrial wastes or other wastes from a private dwelling of less than three families and the discharge consists of a flow of less then one thousand gallons a day. Counties, cities, and towns are able to adopt and enforce additional local laws provided that they are not inconsistent with the provisions of this statute or the sanitary code. The commissioner may delegate his duties subject to such conditions as he may establish. Public hearings are provided for in connection with the construction, operation, alteration or extension of a deep well disposal system in the locale in which it will operate and notice requirements are set forth. Public hearings will also be required upon denial, revocation or modification of an issued permit. (Sutton-Florida)
W74-05595

WATER POLLUTION CONTROL POWERS.
N.Y. Environmental Conservation Law, secs. 15-0313 through 15-0315 (1972).

Descriptors: *Water pollution, *Water pollution control, *Water quality control, *Water resources, *Water conservation, *New York, Legislation, Interagency cooperation, Cost allocation, Administration, Water policy, Water pollution sources, Water resources development, Water quality, Environmental conservation, Comprehensive planning.
Identifiers: Administrative regulations.

This statute deals with the New York department of water resources and the powers and responsibilities of that department with respect to water pollution control. The department is authorized to classify state waters in accordance with the best usage in the public interest theory and to alter, modify or amend water quality and purity standards for the control of pollution in those waters. The department is further authorized to adopt and enforce regulations governing the use of chemicals in water for the control and elimination of aquatic vegetation, for the control of undesirable fish or for the control of aquatic insects, subject to certain provisions set forth. Cooperation between the department and other governmental bodies is in order to adequately protect the interests of the state in its water resources. The department shall be the agent of the state to obtain the aid and assistance of appropriate federal agencies and may enter into contracts when required. Such contracts, containing cost allocations, may be made by the department, provided that payment by the state shall not exceed one-half the cost, including personal service, of the service rendered by the federal agencies. PROTECTION OF WATER.
New York Environmental Conservation Law, secs. 15-0501 thru 15-0515.

Descriptors: *New York, *Legislation, *Permits, *Water law, *Water protection, Water policy, Structures, Impoundments, Dams, Dikes, Legal aspects, Administrative agencies, Alteration of flow, Diversion, Obstruction of flow, Erosion, Pollution control, Flood prevention, Flood protection, Natural resources, Ecology, Environment, Resources development, Water resources, Water utilization, Navigable waters, Water demand, Water sources.

No person or public corporation shall change, modify or disturb the course, channel or bed of any stream or remove any sand, gravel or other materials without a permit. Before issuing a permit for any of the above activities the New York Department of Environmental Conservation shall determine the effect that such will have on soil erosion, increased turbidity of the waters, irregular variations in the velocity, temperature and level of the waters and also the resultant loss of fish and aquatic wildlife and the dangers of flooding and pollution. The Department shall also consider the relative effect that such activities will have on the natural resources of the state and the general health, safety and welfare of the people of the state. Permits shall be issued only when the Department has made certain that such projects will afford proper protection to the beneficial public uses of such water courses. Provisions of this enactment shall not affect the navigable waters of the state. Construction of dams, impoundment structures, docks and piers shall also be made only be permit pursuant to the directions of this statute. (Silber-Florida)

NTERSTATE MINING COMPACT.
.C. Gen. Stat., secs. 74-37 thru 74-38 (1967).

escriptors: *North Carolina, *Mine drainage, Water pollution sources, *Mine wastes, Coordination, *Land management, *Interstate ompacts, Decision making, Social aspects, Legal spects, Public health, Safety, Reclamation, State overnments, Legislation, Administration, Adinistrative agencies, Water conservation, ecreation, Wildlife habitat, Waste ater(Pollution), Water resources, Water quality, esthetics.
lentifiers: Administrative regulations.

The effects of mining on the availability of land, water and other resources present many problems which can be approached only with due consideration of both public and private rights. This interstate compact is aimed at the protection and restoration of land, water, and other resources affected by mining. It is also aimed at the reduction and elimination of water pollution attributable to mining. Each party state will formulate and establish an effective program for the conservation and use of mined land. The program will seek to accomplish the following: the protection of the public; the protection of landowners from damage to their land and structures on the land; and the safe handling of mine wastes to reduce effects on the aesthetic value and utility of land and water. The Interstate Mining Commission has power to study mining operations to gain knowledge on the effects of such operations on soil, water, animal life, recreation, and community development. The Commission can also make recommendations as to aspects of law within the purview of this compact. The Commission will be made up of the governor of each state. The governor shall have the assistance of an advisory body and the statute establishes this committee to be called the 'mining council.' (Sperling-Florida)
W74-05604

NORTH CAROLINA WATER SAFETY COMMITTEE.
N.C. Gen. Stat., secs. 75A-20 thru 75A-26 (1969).

Descriptors: *North Carolina, *Recreation, *Safety, *Administrative agencies, State governments, Legislation, Coordination, Adoption of practices, Project planning, Water demand, Recreation demand, Social aspects, Water policy, Administration, Education, Research, Political aspects, Local governments, Budgeting, Operating costs.

This statute establishes the North Carolina Water Safety Committee to act as an advisory body to public and private agencies and interests in regard to the maintenance of a water safety program. Members on the Committee will be appointed by the Governor for three year terms. Local authorities may sponsor local safety committees to consult for the needs and desires of the public in matters of water recreation and safety. Members of this committee will receive no remuneration except travel and subsistence allowances. The members are under an obligation to keep themselves informed on problems of water recreation and safety in their area. They are to study these problems and also those that may be referred to them by their sponsor or by the chairman of the North Carolina Water Safety Committee. They are to make reports either on their own motion or in response to a request for a study on these problems, with suggestions for remedies where feasible. These reports may be made to the sponsor, the State committee, or any public or private person or agency with the power to effect improvements in the level of water recreation safety to the public. The committees may also coordinate programs of public education in the field of water safety. (Sperling-Florida)

PUBLIC WATER SUPPLY SYSTEMS.
N.C. Gen. Stat., sec. 130-161.1 (1971).

Descriptors: *North Carolina, *Public health, *Administration, *Water resources development, Water demand, Water distribution(Applied), Water resources, Water storage, Water supply, Drought tolerance, Water purification, Water quality, Water yield, State governments, Regulation, Legislation, Adoption of practices, Administrative agencies, Political aspects, Water treatment, Domestic water, Disinfection, Safety, Economic aspects, Specifications, Water pollution.
Identifiers: *Administrative regulations.

The increase in small privately owned public water supplies makes it difficult for state regulating agencies to maintain proper standards of service, quality, and safety. Small systems are usually inferior to larger ones as to source, facilities, and quality. Few small systems give any treatment and this is a potential hazard. Most systems are installed for domestic use with little thought to adequate fire protection. Small systems are difficult to expand or to incorporate into larger systems. The lack of ample source and storage facilities make, the smaller system vulnerable to drought. Many small systems are owned by real estate developers whose interest ends with the sale of lots served by the system. Better coordination and management of water supply systems is essential to protect the public health. The North Carolina Department of Human Resources is authorized: to adopt standards and criteria for the design and construction of public water supply systems; to require improvements to existing public water supply systems; and to require disinfection of water supplies when coliform bacteria count is high, or when the continued use of the water is potentially hazardous. (Sperling-Florida)
W74-05606

WATER QUALITY AND EFFLUENT STANDARDS.
Md. Code Ann. art. 96A, sec. 27 (Supp 1973).

Descriptors: *Maryland, *Legislation, *Administrative agencies, Specifications, *Waste water disposal, *Waste water treatment, State governments, Water conservation, Public health, Wildlife, Water storage, Sewage effluents, Radioactive wastes, Confined water, Water quality, *Water quality standards, Water wells, Groundwater.

Maryland has enacted water quality and effluent standards applicable to the waters of the state. The standards are to protect the public health and to insure the present and future use of such waters for public water supply, fish and wildlife, recreational purposes, and other legitimate uses. The water quality standards will specify the concentrations of pollutants in water, the minimum permissible concentrations of oxygen and other desirable matter, and the temperature range for the water. Effluent standards will specify the concentrations and the physical, thermal, chemical, biological, and radioactive properties of wastes which may be discharged into the waters. It also prescribes regulations for filling and sealing of abandoned water wells and holes, to prevent groundwater contamination, seepage, and drainage into the waters of the state. The statute empowers the administration to formulate regulations for pesticides and other articles which constitute a water pollution hazard. The methods, facilities, standards, and devices for transfer, storage, treatment, and disposal of oil and other substances, as well as standards and procedures for monitoring pollutants, are also prescribed by regulation. (Sperling-Florida)
W74-05607

POLLUTING OR CONTAMINATING STATE WATERS.
Md. Code Ann. art. 96A sec. 26 (Supp 1973).

Descriptors: *Maryland, *Water pollution sources, *Water conservation, *Permits, *Legislation, Waste water treatment, State governments, Waste water disposal, Discharge(Water), Public health, Treatment facilities, Water pollution treatment, Legal aspects, Administrative agencies, Regulation, Pollutants.

It is unlawful for any person to discharge any pollutant into the waters of the state of Maryland. Any person intending to construct or modify any disposal system or any state-owned treatment facility or any other outlet which would result in a discharge of pollutants or an increase in the

discharge of pollutants must obtain a permit. Such a permit may issue after public notice and opportunity for public hearing on condition that the discharge meets or will meet all applicable state and federal water quality standards. Each permit will be of a term not to exceed five years. A new permit will be issued after the same procedure are followed and conditions are met. Issuance of the permit is contingent upon the grant of a right of entrance upon the permit site at any reasonable time to inspect and investigate for violations of the permit conditions. It may be required of the owner or operator of any source of a discharge of pollutants to: (1) establish and maintain records; (2) make reports; (3) maintain monitoring equipment; (4) sample discharges; and (5) provide other information as to pollutants. Toxic effluent standards may be imposed on industrial users of publicly owned treatment facilities. (Sperling-Florida)

POWER PLANT ENVIRONMENTAL RESEARCH PROGRAM.
Md. Code Ann. art. 66C, sec 767 (Supp 1973).

Descriptors: *Maryland, *Administrative agencies, *Adoption of practices, Research and development, State governments, Legislation, Project planning, Water resources development, Environmental effects, Economic aspects, Permits, Electric power plants, Water conservation, Social aspects, Regulation, Land use, Baseline studies.

Maryland has established a continuing research program for electric power plant site evaluation and related environmental and land use considerations. The Secretary of Natural Resources is to institute effective procedures for coordinating environmental research assignments, so as to prevent the dissipation of money, time, and effort. The state's electric companies will be reimbursed, from the fund created for environmental research, for any environmental research specifically required to satisfy application and permit requirements of federal, state, and local regulatory agencies. To qualify for this reimbursement the electric company must furnish in advance an outline of the program and its estimated cost. Each program will include: (1) general biological and ecological baseline studies; (2) field and laboratory research to assist prediction of the effects of variation of natural waters caused by electric generating plant operations; (3) provisions for monitoring the operations of existing power facilities; (4) research and investigations relating to the effects on air resources; (5) an environmental evaluation of the plant site in regard to the waters of the state; (6) environmental effects of new power generation technologies; and (7) an analysis of the socio-economic impact of electric power generation facilities on the land uses of the state. SCENIC RIVERS.
Md. Code Ann. art. 66C, secs. 759-763 as amended (Supp 1973).

Descriptors: *Maryland, *Legislation, *Aesthetics, *Scenery, Water pollution effects, Engineering structures, Recreation, Wildlife management, Water conservation, Rivers, Administrative agencies, Environmental sanitation, Flood protection, Channelization, Fishing, Land management, Project planning, Water resources development, Land use, Water resources, River flow, Obstruction to flow.

The Maryland Scenic Rivers Review Board has been created to protect the scenic, fish, wildlife, and other recreation values of Maryland rivers. The Board is to inventory all potential scenic river sites. The statute gives a description of what rivers, streams, or sections of streams and related adjacent lands may be recommended to be included in the system of scenic rivers. The scenic river program is designed to provide wise management of the resources on the land and preservation of their scenic qualities. Development is to be limited to activities such as fishing, hunting, hiking, etc. A study and plan for use and development of water and related land resources for public and private use will be promulgated for each of the components of the Scenic Rivers System. In all planning for the use and development of water and related land resources, including the construction of diversions, roadways, crossings, channelization, locks, and canals, full consideration must be given to the river as a scenic resource. The Secretary of the Maryland Department of Natural Resources must approve any structure impeding the natural flow of a scenic river. (Sperling-Florida)

STATE WETLANDS.
Md. Code Ann. art. 66C, sec 720 (Supp 1973).

Descriptors: *Maryland, *State governments, *Riparian rights, *Legal aspects, *Boundaries(Property), Riparian land, Riparian waters, Navigable waters, Accretion(Legal aspects), Avulsion, Bank erosion, Reclamation, Shore protection, Engineering structures, Administrative agencies, Legislation.

A natural person who owns land bounding on navigable waters is entitled to all natural accretions to his land. Such a party may reclaim fast land lost by erosion or avulsion during his ownership of the land after January 1, 1972. The extent of this reclamation is to provable preexisting boundaries. Improvements into the waters in front of his land are allowed for the purposes of preserving his access to navigable water or protecting his shore against erosion. An improvement, after construction, is the property of the owner of the land to which it is attached. Other uses approved by the Maryland Board of Public Works are not excluded by the operation of this section. (Sperling-Florida)
W74-05611

SANITARY FACILITIES FUND.
Md. Code Ann., art. 43, sec. 387B (1971).

Descriptors: *Maryland, *Administrative agencies, *Adoption of practices, *Coordination, Project planning, Economics, State governments, Decision making, Engineering structures, Public health, Waste water disposal, Waste water treatment, Solid wastes, Budget, Sewage disposal, Drainage systems, Conduits, Legislation, Governmental interrelations.
Identifiers: *Administrative regulations.

This statute establishes a fund to be utilized in the planning and construction of water and sewerage facilities and for solid waste disposal systems and solid waste acceptance facilities. The Maryland State Department of Health is authorized to utilize funds appropriated in the State operating budget which provides for general local health services. The proportion of State, county, and local funds shall be that which is specified for the financing of minimum health services. The construction segment of the funds shall be available to finance the basic main facilities of a sewerage system for the collection and treatment of sewage and industrial wastes from lateral or collector sewers. The State Department of Health and the local governments are authorized to enter into joint financing agreements for the utilization of whatever federal grants may be available. In the event that a special governmental agency is created to provide sanitary facilities within a county or municipality, the funds cited in this section may be available to such an agency. LEGAL-ECONOMIC ASPECTS OF FISHERI SESSION SUMMARY,
Louisiana State Univ., Baton Rouge. Law Schoc H. G. Knight.
In: Proceedings of Fourth National Sea Gr Conference, October 12-13, 1971, Madis Wisconsin, 1225 West Dayton Street, Sea Gr Program, University of Wisconsin, Madison, 187-189.

Descriptors: *Fisheries, *Fish manageme United States, Legislation, Economics, Le aspects, Oceans, United Nations, Federal gove ment, Decision making, Research and devel ment.
Identifiers: Sea Grant.

A wide range of problems concerning internatio fishery management were considered by a N tional Sea Grant Program panel on 'Leg Economic Aspects of Fisheries,' which met October 13, 1971. One issue was the legal a economic aspects of the conservation of the liv resources of the high seas. Also considered w the legal and economic aspects of the allocation fisheries management, as well as Article III, wh is the United States' proposal for internatio fishery management as presented to the Uni Nations Seabed Committee. The fourth ma issue was the question of decision-mak procedures in the United States Government fisheries and other law of the sea matters. Only issues raised are identified in this summary a cles, with no reference to the main substance that discussion. However, the issues were relat to the role which Sea Grant support recipie might play in assisting in a solution of the issu (See also W74-05644) (Pinsky-Wisconsin)

FISHERY PROBLEMS AND THE U.S. DRA ARTICLE,
Resources for the Future, Inc., Washington, D.C F. T. Christy, Jr.
In: Proceedings of Fourth National Sea Gr Conference, October 12-13, 1971, Madis Wisconsin, 1225 West Dayton Street, Sea Gr Program, University of Wisconsin, Madison 200-217. 19 ref.

Descriptors: *Fishing, *Fish manageme *International law, Economic impact, Conser tion, Legislation, Oceans, United States, Milit aspects, Submarines, Social aspects, Econor efficiency.
Identifiers: Distribution of wealth, Soc sciences, U.S. Draft Article on Fisheries.

In order to provide a background for an asse ment of the United States Draft Article on Fis ries, three main points were discussed. The firs that freedom of fishing is no longer a viable c cept, for increased demand for these limit supply resources has resulted in depletion, caus one unit's usage to diminish the value to oth units. Another point of discussion is that of c tributing the ocean's wealth, the means of distri tion of wealth, and the criteria for distribution wealth. The third point is that the problems to solved are complex and require consideration

ɔcial scientists if they are to be resolved without ɔnflict. The U.S. Draft Article on Fisheries seeks ɔ preserve the status quo, with little relevance for ıe developments that are taking place and no use-ıl guide for future decisions. U.S. military in-rests in the sea provide a severe constraint on ıe potential of the U.S. Draft Article. Other short-ɔmings of the Article were caused by lack of put from the concerned public and limited social ience research in this area. (See also W74-05644) insky-Wisconsin)

N OVERVIEW OF THE JULY-AUGUST 1971 REPARATORY SESSION OF THE LAW OF HE SEA,
epartment of State, Washington, D.C. Office of e Legal Advisor.
.. H. Nordquist.
oc. available from the National Technical Infor-ation Service as COM-72-11408, $3.00 in paper ɔpy, $1.45 in microfiche. In: Proceedings of the lth Annual Session Gulf and Caribbean Fisheries ıstitute, November 1971, Rosenstiel School of arine and Atmospheric Science, University of iami, Coral Gables, Florida, p 6-10, 1972.

escriptors: *Law of the Sea, *Legislation, Conferences, Navigation, United Nations, Trea-s, Fisheries, International waters, Reasonable ıe, Water pollution control, Research and velopment.
lentifiers: Seabed exploitation, National jurisdic-ɔn, Marine pollution, Geneva(Switzerland).

perspective is given of the current stage of inter-ıtional negotiations on the Law of the Sea. Two reparatory sessions of a comprehensive Law of e Sea conference (1973) have been scheduled by e United Nations General Assembly. Subcom-ittee I will prepare draft treaty articles on an in-rnational regime for the seabed area beyond the nits of national jurisdiction. Subcommittee II ill compile a comprehensive list of, and draft eaty articles on, subjects and issues relating to aditional Law of the Sea matters such as the ter-torial sea, international straits, and fisheries. ubcommittee III will deal with preservation of e marine environment and scientific research. he United States stressed the desirability of in-rnationally agreed standards as well as the im-ɔrtant role of the specialized agencies of the nited Nations and various inter-governmental oups in coping with marine pollution. The ıestion of freedom of scientific research in the eans was the subject of some differences of ɔinion. While meaningful negotiations are just ginning, the number and quality of the presenta-ɔns in Geneva did indicate that systematic ogress was being made, as articulation of na-ɔnal interests is a necessary first step. CCEPTABILITY TO THE FISHING INDUS-RY OF THE CURRENT U.S. POSITION ON SHERIES. ARTICLE III -- LAW OF THE SEA ONFERENCE -- 1973,
ational Shrimp Congress, Inc., Key West, Fla.
. R. Neblett.
: Proceedings of the 24th Annual Session Gulf d Caribbean Fisheries Institute, November 71, Rosenstiel School of Marine and At-ospheric Science, University of Miami, Coral ables, Florida, p 11-14, 1972.

escriptors: *Marine fisheries, *Law of the Sea, Conferences, *United States, United Nations, ternational law.

ıe United States fishing industry takes strenuous ception to the U.S. official position, submitted Article III, Law of the Sea Conference. The nilarity of proposals advanced by the U.S. as a ustee zone' and Mexico as a 'management' con-pt is construed as an attempt to provide a device to allow some foreign fishing. Fisheries seek to be heard in the inner circles of government in order to advise at critical times as to the proposals tabled, both with regard to domestic fisheries and with regard to the reactions of foreign governments. Most major fisheries submitted concrete proposals at the 1971 University of Rhode Island Law of the Sea session, which sought to safeguard the proponent's interests and at the same time offer solutions for other U.S. fisheries. Subsequent to the University of Rhode Island meeting, representatives of tuna, shrimp, and salmon fisheries met in Los Angeles and prepared a joint statement which reflected acceptable positions for these giants, whose total production in dollars represents over 60% of the total U.S. flag production. It is predicted that unless the true significance and importance of a U.S. position on fisheries emerges, the presently planned tactic will fail. (See also W74-05651) (Auen-Wisconsin)

ALTERNATIVES TO THE CURRENT U.S. POSITION ON FISHERIES,
Miami Univ., Coral Gables, Fla. School of Law.
T. A. Clingam, Jr.
In: Proceedings of the 24th Annual Session Gulf and Caribbean Fisheries Institute, November 1971, Rosenstiel School of Marine and Atmospheric Science, University of Miami, Coral Gables, Florida, p 15-18, 1972.

Descriptors: *United States, *Marine fisheries, *Law of the Sea, Legislation, Coasts, Navigation, Priorities, Management, Zoning.
Identifiers: Territorial seas, Coastal waters.

It is suggested that Article III of the Law of the Sea Conference include the establishment of a zone of at least limited coastal state jurisdiction that would enable the state to implement timely and effective fishery management and afford economic protection to coastal state fisheries. Regulations pertinent to such a management scheme necessarily pertain to stocks which do not conform to artificial boundaries, although the drawing of such lines may be required for enforcement purposes and for the clear delineation of economically significant zones. However, such lines should be constructed on biological rather than geometrical criteria. A proposal for effective management should also permit the coastal state to maximize its sustainable returns, reserving the remaining catch, if any, to other nations. More responsible, and smaller, groups of nations having realistic interests in the regulated stock should be formed, and care should be taken how the participating nations are identified. The scheme must have some effective mechanism for settlement of disputes. The seeming intransigence with regard to freedom of transit, if it persevers, will leave scant hope for acceptance of the U.S. proposal. Failure to agree would stimulate a period of unrestricted unilateral claims to increased coastal state competition, an inherently self-destructive solution. (See also W74-05651) (Auen-Wisconsin)
W74-05653

FOREIGN FISHING OFF THE SOUTHEASTERN UNITED STATES UNDER THE CURRENTLY ACCEPTED CONTIGUOUS SEA LIMITATION,
National Marine Fisheries Service, St. Petersburg, Fla. Southeast Region.
C. M. Fuss, Jr.
In: Proceedings of the 24th Annual Session Gulf and Caribbean Fisheries Institute, November 1971, Rosenstiel School of Marine and Atmospheric Science, University of Miami, Coral Gables, Florida, p 19-32, 1972. 8 fig, 3 tab, 4 ref.

Descriptors: *Gulf of Mexico, *Marine fisheries, *International law, Treaties, Southeast U.S., Atlantic Ocean, Pacific Northwest U.S., Commercial fishing, Northeast U.S., Shrimp.
Identifiers: *Foreign fishing, *Surveillance, Caribbean Sea.

Control of foreign fishing beyond the 12 mile fishery zone can only be regulated by bilateral and multilateral international fishery agreements. The extent of foreign fishing between October 1970 and October 1971 off the southeastern U.S., the Atlantic coastal waters south of 37 degrees north latitude and the Gulf coastal waters from Florida to the Mexican border are summarized. Surveillance flights are scheduled through the Coast Guard in Miami and New Orleans. Additional sighting reports are obtained from state conservation agencies, commercial and sports fishermen and U.S. merchant vessels. The estimated foreign catch of 100 million pounds of the southeastern U.S. amounted to about 8% of the foreign catch off the northeastern U.S. in 1970 (1.3 billion pounds) and about 5% of the U.S. domestic catch in the southeast region. It is compared with the northeastern U.S. where the foreign catch is currently about 98% of the domestic catch. Comparison of the estimated value of Atlantic and Gulf foreign catches gives further insight into possible problems in the Gulf area. Uncontrolled foreign fishing would constitute a significant threat to the shrimp industry of the southeastern United States. (See also W74-05651) (Jones-Wisconsin)

POLLUTION MANAGEMENT IN THE COASTAL STATES,
Coastal States Organization, Savannah, Ga.
T. H. Suddath.
In: Proceedings of the 24th Annual Session Gulf and Caribbean Fisheries Institute, November 1971, Rosenstiel School of Marine and Atmospheric Science, University of Miami, Coral Gables, Florida, p 42-47, 1972. 1 fig.

Descriptors: *Water pollution control, *Regulation, *Pollution abatement, *Management, *Coasts, Political constraints, Estuaries, Marshes, Wetlands, Oceans, Recreation, Islands, Legislation, State governments.
Identifiers: *Coastal zone management.

A state structure for the management of pollution in the coastal zone based on a systems management concept is presented. Key management areas are defined as fresh water pollution, mineral deposits, air pollution, coastal marshlands, wetlands, estuaries and recreational areas. Key issues involved in coastal zone pollution management involve definition of the extent of management control, allocation of responsibility among various levels of government and delineation of the management areas. The proposed state management structure complements the three new federal agencies (Environmental Protection Agency, National Oceanic and Atmospheric Administration, Council for Environmental Quality), thus facilitating participation in their grants and regulatory programs. This structural parallel allows a balance between local and federal interests. The state management structure includes an Environmental Protection Agency and an Environmental Quality Council to serve as a sort of grand jury and to make recommendations to the governor. FLORIDA'S RATIONALE FOR COASTAL ZONE MANAGEMENT,
Florida Dept. of Natural Resources, Tallahassee. Coastal Coordinating Council.
F. Barloga, L. Burney, and B. Johnson.
In: Proceedings of the 24th Annual Session Gulf and Caribbean Fisheries Institute, November 1971, Rosenstiel School of Marine and Atmospheric Science, University of Miami, Coral Gables, Florida, p 62-67, 1972.

Descriptors: *Florida, *Environmental effects, *Water resources development, *Comprehensive planning, Management, Natural resources, Coasts, Preservation, Conservation, Land use, Zoning, Compatibility.

Identifiers: *Florida Coastal Zone Master Plan, Development.

Because the coastal zone is Florida's most important asset, great care must be taken in choosing tools to alleviate adverse effects of coastal development. Currently existing tools which provide potential for effective coastal zone management are essential but inadequate to accomplish their goal. The Florida Coastal Coordinating Council created in 1970 presents the first opportunity for state level research, coordination and planning necessary for orderly development and optimum use of coastal areas. The council will plan maintenance and improvement of environmental quality and encourage joint use of resources by compatible activities or provide for allocation of exclusive use by non-compatible activities to maximize the retention of options for the future. Preliminary accomplishments and problems encountered by the council are reviewed. (See also W74-05651) (Weaver-Wisconsin)

CAN COASTAL RESOURCES SURVIVE DEVELOPMENT,
Rosenstiel School of Marine and Atmospheric Sciences, Miami, Fla.
B. J. Yokel, and D. C. Tabb.
In: Proceedings of the 24th Annual Session Gulf and Caribbean Fisheries Institute, November 1971, Rosenstiel School of Marine and Atmospheric Science, University of Miami, Coral Gables, Florida, p 68-71, 1972. 1 fig.

Descriptors: *Florida, *Habitat improvement, *Wildlife conservation, Environmental effects, Management, Land use, Permits, Coordination, Conservation, Planning, Aesthetics.
Identifiers: *Coastal Zone management, Real estate development, Compatible use.

Coastal bay bottom, estuarine, and marshland development, once encouraged by policy, has become subject to tighter control as the ecological role of these coastal systems has become better understood. A plan for statewide coastal management is being developed by the Coastal Coordinating Council of the Florida Department of Natural Resources. However, as an example of privately initiated alternatives for coastal management in the absence of the Coastal Coordinating Council, the case of the establishment of the Rookery Bay Sanctuary by the efforts of a small group of concerned citizens is reviewed. Organization, initiated in response to private real estate development plans, led to a substantial grant by the National Audubon Society and the establishment of the Sanctuary, not only as a preserve, but as a field area for multidisciplinary study of effects of upland development. STATE-FEDERAL MANAGEMENT INITIATIVE,
National Marine Fisheries Service, St. Petersburg, Fla. Southeast Region.
R. T. Whiteleather.
In: Proceedings of the 24th Annual Session Gulf and Caribbean Fisheries Institute, November 1971, Rosenstiel School of Marine and Atmospheric Science, University of Miami, Coral Gables, Florida, p 72-74, 1972.

Descriptors: *Management, *Marine fisheries, *State governments, *Federal government, Commercial fishing, Regulation, Legislation, Economics, Social aspects, Fish conservation.
Identifiers: *Marine resources, *Coastal Zone management, International exploitation, Limited entry.

The National Oceanic and Atmospheric Administration has been assigned responsibility for conservation and wisest utilization of the total living marine resource. In the organization's restructuring to deal with the complex assignment, State-Federal fishery management iniative is a key approach designed to develop cooperative management plans. Migratory marine fisheries would be under national management, while states would have greater responsibility for regulation of fisheries within their contiguous fishery zone. Implementation of the initiative will involve careful delineation of international, national, and state guidelines for fishery management and the careful investigation of alternative state and/or federal management systems. Preliminary efforts have already begun, but resolution of implementation problems is expected to require several years of research. Several fundamental problems in this area are mentioned. ILL SUCCESS SPOIL NEPA,
Zeldin.
udubon, Vol 74, No 4, p 106-111, July 1972. 1 s.

scriptors: *Statutes, *Federal government, ourt decisions, *Political aspects, Industries, sthetics, Permits, Administrative agencies, cision-making, Local governments, Public alth, Environmental sanitation, Social need, So- l value, Environment, Environmental effects, gulation.
ntifiers: *Environmental impact statement, ational Environmental Policy Act, Stand- (Legal), Public trust doctrine, Sovereign immu- y, Citizen lawsuits.

e National Environmental Policy Act (NEPA) uired all federal agencies to prepare an environ- ntal impact statement on any proposed action nificantly affecting the quality of the human en- onment. This law worked well toward creating zen lawsuits. Piqued citizen suits and prodded its industry friends, the government has tried to p environmentalists from having their day in rt. The government often argues standing and reign immunity, and also attempts to have h bonds set to make it financially impossible for anizations to undertake court action. But the rts have sustained enough citizen lawsuits to ke it a weapon to be feared. Many federal agen- s and some members of Congress prefer to have iness as usual without outside interference. s has produced an environmental backlash: (1) House passed a bill allowing the Atomic Ener- gy Commission (AEC) to issue licenses for nuclear plants without studying their environmental im- pact; (2) Nixon administration proposals to create loopholes in the NEPA; and (3) restrictions on citizen court suits. The administration has at- tempted to pit environmental objectives against economic objectives and show their incompatibili- ty. The 1899 Refuse Act is the major government enforcement tool and perhaps because of this, is endangered by pending bills. Until there is an ef- fective national program of legislation and en- forcement, individual citizens and public groups must be able to go to court and push agencies and legislators into action. SOIL AND WATER CONSERVATION.
Minn Stat Ann, secs 40.01, 40.02 (Supp 1973), as amended, ch 412, sec 9 (1973) Laws of Minn.

Descriptors: *Land development, *Soil erosion, *Soil conservation, *Soil management, *Water resources development, *Land use, Minnesota, Legislation, Administration, Recreational development, Erosion control, Land development, Wildlife, Land resource development, Siltation, Flood control.

The public policy is to provide for the conservation of the soil resources of the state of Minnesota and to control and prevent soil erosion through land resource planning and development. Improper land use and failure of land occupiers to change their methods are the reasons for such legislation. The Act sets forth ways to rectify the situation by implementing land use practices that will effectively reduce siltation and loss of land base through activities associated with farming, mining, construction and forestry. The Act is also aimed at flood prevention and the conservation, development, utilization, and disposal of water, included but not limited to measures for fish, wildlife and recreational development. (Sutton-Florida)

MUNICIPAL WATER POLLUTION CONTROL--STANDARDS OF QUALITY AND PURITY.
Minn Stat Ann, sec 115.44 (Supp 1973), as amended, ch 374, secs 15, 16 (1973) Laws of Minn.

Descriptors: *Water pollution, *Water quality standards, *Water pollution control, *Water resources development, Legislation, *Minnesota, Water law, Legal aspects, Municipal governments, Public health, Administrative agencies, Sewage effluents, Water pollution sources.

These amended sections are aimed at attaining the objectives established by the statutes dealing with water pollution and water quality. The Minnesota pollution control agency is given the power, whenever practical and advisable, to establish standards specifying quality and purity or maximum permissible pollutional content of effluent, without regard to water quality standards. There are two provisos regarding this new power; that such new standards will assure the protection and propagation of a balanced, indigenous population of fish and wildlife in the body of water and that any point source of a discharge having a heat component shall not be subject to more stringent effluent limitations, with regard to that heat component that those previously established for such facility. The statute deals with conflicts between state laws and similar federal provisions and compliance with such state laws are waived to the extent necessary to enable the agency to comply with federal laws, rules, and regulations. (Sutton-Florida)

WATER POLLUTION CONTROL--ENFORCEMENT.
Minn Stat Ann, sec 115.071 (Supp 1973), as amended, ch 374, sec 13 (1973) Laws of Minn.

Descriptors: *Water pollution control, *Water quality standards, *Enforcement, *Remedies, Statutes, Water law, Legal aspects, *Minnesota, Administrative agencies, State jurisdiction, Adjudication procedure, Water quality control, Water resources.

Listing various remedies available, including criminal prosecutions, civil penalties, injunctions and actions to compel performance, the amended statute deals with the enforcement of water pollution control laws. The criminal provisions distinguish between wilful and negligent actions. Although the maximum limits of not more than $25,000 per day in violation of a law or order and/or imprisonment of up to one year are the same in both categories, and the statute also provides for harsher penalties for further convictions, the statute further provides for criminal penalties where there is tampering with monitoring and information devices, and designates the enforcement duties. Civil penalties are then outlined, as well as acceptable defenses for violative actions and all actions are to be brought by the attorney general in the name of the state. Injunctions can be issued against such action if they would create a public nuisance and again are to be sought by the attorney general. In actions to compel performance, private defendants adjudicated responsible may be compelled to do and perform any and all acts within their power reasonably necessary to accomplish the order's purpose. The statute also covers actions in which the defendant is a municipality or other governmental agency. (Sutton-Florida)

DRAINAGE.
Minn Stat Ann, sec 106.021 (Supp 1973), as amended, ch 479, secs 4, 5, 6, 7 (1973) Laws of Minn.

Descriptors: *Minnesota, *Drainage engineering, *Drainage systems, *Flood control, *Water works, *Local governments, Surface waters, Water management(Applied), Water control, Water distribution(Applied), Regulation, Drainage programs, Administrative agencies, Administration, Legislation, Drainage districts.
Identifiers: *Administrative regulations, Fill permits, Licenses.

Power is conferred on the county boards and district courts to make all necessary orders for the construction and maintenance of public drainage systems. These drainage systems can be extended into or through any municipality to find an outlet. No lake will be drained or natural water course channelized if it is a part of the public waters of the state. These same measures can be taken for flood control except that public waters cannot be affected without approval of the Commissioner of Natural Resources. The petitioners for any public ditch, or the county board or court may ask for the commissioner's approval. The commissioner is to make a list of criteria for the board and court to consider when establishing and improving drainage systems. The criteria are to relate to the social, economic, and environmental impact of the proposed drainage system. The criteria will be limited to the following: cost-benefit analysis, public and private; analysis of present and future agricultural land acreage; flooding characteristics of project lands; alternative measures; water quality effects of the project; effects on fish and wildlife resources; and the overall environmental impact. (Sperling-Florida)
W74-05754

FLOOD PLAIN MANAGEMENT.
Minn Stat Ann, secs 104.01 to 104.07 (Supp 1973), as amended, ch 412, sec 10, ch 351, secs 1-8 (1973) Laws of Minn.

Descriptors: *Water yield improvement, *Water supply, Water resources development,

*Watershed management, *Flood plains, *Minnesota, Nonestructural alternatives, Flood protection, Flood plain zoning, Flood control, Erosion control, Flood damage, Legal aspects, Water law, Legislation.

Reducing flood damages through flood plain management, stressing nonstructural measures including flood plain zoning, flood proofing and flood warning practices constitutes the Minnesota statute's purpose. In furtherance of this goal, flood plain management ordinances are to be considered first and local governmental units must adopt them before seeking alternative methods. The powers are given to the commissioner of natural resources, who shall conduct periodic inspections to determine the effectiveness of local programs, including an evaluation of the enforcement of and compliance with, local flood plain management ordinances. Due consideration is to be given to the needs of an industry whose business requires it to be located within a flood plain. When the commissioner determines that sufficient technical information is available for the delineation of flood plains and floodways on a watercourse, he shall notify affected governmental units that such information is available. Every structure, fill and deposit, placed or maintained in violation of an ordinance shall be considered a public nuisance and may be enjoined. Such violation exists shall be a separate offense. (Sutton-Florida)
W74-05755

WATER RESOURCES MANAGEMENT.
Minn Stat Ann, secs 378.31, 378.32 (Supp 1973), amended, ch 702, secs 4, 5 (1973) Laws of Minn.

Descriptors: *Water resources, *Water resources development, *Project purposes, *Water conservation, *Local governments, Statutes, Water law, *Minnesota, Water supply, Administrative agencies, Land resources, Water users, Watershed management, Water yield improvement, Interagency cooperation.

To enhance the use and enjoyment of Minnesota's lakes, a statewide improvement program is established to preserve the natural character, improve water quality, provide for water quantity and to assure protection of the lakes from man's detrimental activities and certain natural processes. The power to enforce the sections of the statute is given to the county board and all programs undertaken pursuant to such powers shall be consistent with statewide water and related land resources plans. Powers shall include acquiring any existing dam or control works by various means, projects to change course current, and to construct and operate water control structures. Further, the county board may undertake research to determine the condition and development of the body of water and water entering it by developing a comprehensive plan to eliminate water pollution. Other related powers are also listed, including water surface use regulation by ordinances and such proposed zoning ordinances shall be submitted to the commissioner of natural resources for approval. The board's broad powers also include regulating and policing public beaches, regulating construction and maintenance of commercial marinas and related facilities and all other structures associated with the state's water resources. (Sutton-Florida)
W74-05756

POLLUTION CONTROL AGENCY.
Minn Stat Ann, secs 116.21 to 116.29, 116.32 to 116.35 (Supp 1973).

Descriptors: *Pollutants, *Water pollution control, *Water pollution sources, *Water treatment, *Water conservation, *Minnesota, Legislation, Administration, Administrative agencies, Detergents, Phosphates, Water quality, Control, Water supply, Water quality control, Legal sanctions, Eutrophication.

This Minnesota statute seeks to encourage the state pollution control agency to set standards limiting the amount of nutrients in various cleaning and water conditioning agents, as they eventually lead to an acceleration of the natural eutrophication process of the state's water. Limitations imposed should be made taking several factors into consideration, including the availability of safe, nonpolluting and effective substitutes, the difference in the mineral content of waters, and the differing needs of industrial, commercial and household users. The Act requires certain tests for percentage content of phosphates in laundry or dishwashing compounds and the display of lists setting forth the percentage content in certain products. Seizure of cleaning agents or chemical water conditioners is provided for and after conviction of a violation, provisions are set up for forfeiture and disposal of the compounds. In addition to penalties, the court may order those persons to refrain from any further violations or to cease operation. (Sutton-Florida)
W74-05757

WATER POLLUTION--CLASSIFICATION OF WATER SUPPLY AND WASTE WATER TREATMENT FACILITIES.
Minn Stat Ann, secs 115.71 to 115.82 (Supp 1973).

Descriptors: *Water pollution, *Water supply, Waste water treatment, *Treatment facilities, *Water conservation, *Minnesota, Legislation, Administration, Waste disposal, Public health, Water resources, Water policy, Legal aspects, Water law, Administrative agencies.

Minnesota enacted this statute for the protection of public health and the conservation and protection of water resources. It classifies all public water supply systems and all public waste water treatment facilities and these classes shall be based on the degree of hazard to public health together with the type and loading of plant and the population served or the average population equivalent of the sewage handled. The Act sets up a board of certification which shall issue certificates for operation, to operators meeting such competency and examination standards as may be set up. In certain cases, such certificates may be issued without examinations. A fee schedule and payment procedure is outlined, as well as the board's power, and an effective violation date set. Violations are considered separate offenses and classified as a misdemeanor. (Sutton-Florida)
W74-05758

CONSTRUCTION, RECONSTRUCTION OR MAINTENANCE OF DRAINS.
Ind Ann Stat secs 27-2101 thru 27-2166 (1970).

Descriptors: *Indiana, *Drainage, *Legal aspects, *Legislation, *Drains, Drainage systems, Urban drainage, Controlled drainage, Statutes, Assessments, Drainage engineering, Controlled drainage, Drainage systems.

These statutes relate to the construction of new drains, reconstruction of drains, periodic maintenance and annual assessments. Included are annotations of decisions under prior law. The article on construction of new drains details the petition procedure, the requirements for hearings, the contents of the surveyor's report, the appeal procedure for rejected petitions, remonstrances to petitions, the final report and a schedule of assessments for improvements. The article on reconstruction of drains describes the surveyor's report, schedules of assessments and damages for reconstruction, hearings, grounds for objection and appeal. The section on periodic maintenance and annual assessments deals with drains classified in need of periodic maintenance, maintenance report and schedule of assessments, hearings, time of filing objections, use of maintenance fund for drains, omission of assessment when authorized and minimum annual assessments. ents, Coastal structures, Recreation, Environ-
ental effects.
entifiers: Coastal island trusts, Public trust doc-
ne.

ıe purpose of this chapter of the laws of Maine is
provide a means whereby state and local offi-
ıls, together with federal officials can take ac-
ın, when appropriate, to protect and manage the
astal islands or groups of coastal islands of the
ıte of Maine. Such protection is to serve the best
:erests and needs of all the citizens for con-
ılled commercial development and sanctuaries
r reaction and relaxation in a manner consistent
th the maintenance and improvement of the
astal island environment. For this purpose, a
astal island trust was established with a commis-
ın to oversee those islands included by the
gislature, for their protection and proper main-
ıance. The commission is to develop and main-
n a comprehensive plan to preserve, restore,
d utilize the commercial, natural, scenic, histori-
l, and recreational values of the coastal islands.

UNTY OF FREEBORN V. BRYSON
CLARATORY JUDGMENT ACTION CON-
RNING PORTIONS OF A NATURAL WIL-
FE MARSH).
N W 2d 290-297 (Minnesota 1973). 8 p.

criptors: *Minnesota, *Environmental effects,
ghway effects, *Wildlife habitats, *Wetlands,
ural resources, Construction, Ecosystems,
demnation, Marshes, Protection, Environ-
t, Judicial decisions, Legal aspects, Public
ts, Highways, Road construction.
itifiers: Environmental Rights Act.

is an action under the Minnesota Environ-
tal Rights Act in response to condemnation proceedings initiated for the purpose of acquiring certain lands for construction of a highway. The main issue on appeal concerned the limitations on the country's power to condemn land for a public use. The plaintiffs owned the farmland which contained marsh lands and wetlands. Experts testified that the area provides a unique natural ecosystem or environment because of its capacity to support a great diversity of life. The defendant county proposed to condemn a strip of the farm for construction of a highway. Expert witnesses gave opinions that the construction would have significant detrimental effect on the area's value as wildlife area. The court held that under the Act, any person may maintain an action for declaratory or equitable relief for protection of natural resources; that the act limits condemnation for public highways; that material evidence could be shown to establish a prima facie case of adverse effects on the environment; and that the county could rebut by showing no proven or feasible alternative or that its conduct was in the public's interest. WILDERNESS PRESERVATION II: BRINGING THE CONVENTION INTO COURT,
Environmental Law Inst., Washington, D.C.
T. Guilbert.
Environmental Law Reporter, Vol III, No 6, p 50044-50050, June 1973. 65 ref.

Descriptors: *International law, *Conservation, *Protection, Wildlife management, Wildlife conservation, Legal aspects, Environmental effects, Ecology, Treaties, Judicial decisions, Wildlife, Wildlife habitats.
Identifiers: *Injunctive relief, *Convention on Nature Protection and Wildlife Preservation, *Organization of American States.

The Convention on Nature Pretection and Wild Life Preservation in the Western Hemisphere is an agreement between the member nations of the Organization of American States (OAS) to maintain strict wilderness reserves inviolate. In many environmental protection suits, the Convention may well provide independent grounds for a decision to enjoin activities which would have detrimental effects on wilderness areas. If the judge decides to protect the wilderness area in question, it is simple for him to invoke the Convention's edict by merely citing the supremacy clause of the United States Constitution which makes treaties the supreme law of the land. There may be difficulties, however, in demonstrating to a court that it is the court's non-discretionary duty to give effect to the convention. It must be shown that the area satisfies all of the criteria for strict wilderness reserves, that the area is either listed as a wilderness reserve with the OAS or that its non-listing has no legal effect, that there is standing to invoke the Convention in this litigation, and that the use sought to be prevented is not 'consistent with the purposes for which the area was established.' A BILL AMENDING THE PUBLIC HEALTH SERVICE ACT AND THE FEDERAL FOOD, DRUG, AND COSMETIC ACT IN ORDER TO ASSURE SAFE DRINKING WATER.
House Bill 1059, 93rd Cong, 1st sess (1973). 30 p.

Descriptors: *Potable water, *Water quality standards, *Public health, *Legislation, Governmental interrelations, Federal government, Government finance, State governments, Administrative agencies, Regulation, Water quality.
Identifiers: Notice.

The Administrator of the Environmental Protection Agency shall publish proposed national primary drinking water regulations within 180 days after the enactment of this title, and he shall publish proposed national secondary drinking water regulations within 270 days after such enactment. Primary drinking water standards shall specify the maximum permissible level in water of each contaminant which in the judgment of the Administrator may have any adverse effect on the health of persons and shall contain criteria and procedures to assure a supply of drinking water which dependably meets the standards promulgated by the Administrator. The states are given primary enforcement responsibility for the public water systems but if the Administrator determines that any public water system in any state does not comply with the national primary standards, he may after 30 days give notice to such state and subsequently commence a civil action. Notwithstanding any other provision of the title, the Administrator, upon receipt of information that a contaminant which is present in or is likely to enter a public water system may present an imminent danger, may immediately take such actions as he may deem necessary. COUNTY CONTROL OF DAM CONSTRUCTION.
Mich Comp Laws Ann, sec 46.22 (Supp 1973).

Descriptors: *Michigan, *Dam construction, *Dam design, *Administrative agencies, *Permits, State governments, Navigable rivers, Water law, Legislation, Regulation, Dams, Engineering structures, Bypasses.

If any person desires to construct a dam, a specification. A new section of this statute provides that any permit to build a request to construct the dam must be presented to the board of supervisors, for their approval, setting forth the dam's dam across a navigable stream shall provide for an easement to the public for an adequate and proximate right of way for the portage of small craft around the dam. Notice of the petition must be published at least three weeks in advance of a mandatory hearing. All owners of land affected must be notified by registered mail. The board has no power to grant the right to anyone to take or injure the lands of another, or to abrogate any requirements set forth in the statutes in the consequence of building the dam. The board must send a copy of any petition for permission to build a dam to the secretary of the natural resources commission along with notice of the time and date of hearing. (Flowers-Florida)

SMITH V. CRUTHIS (INJUNCTION TO PROHIBIT LEVEE AND TO RECOVER FOR CROP DAMAGE).
499 S W 2d 852 (Ark 1973).

Descriptors: *Arkansas, *Levee, *Dike, *Surface runoff, Legal aspects, Judicial decisions, Flood protection, Earthworks, Controlled drainage, Surface drainage, Drainage water, Surface runoff.
Identifiers: Injunctive relief.

This suit primarily concerned a common boundary line. The plaintiffs alleged that the defendant came on their side of the line and erected a levee which obstructed the natural drainage of the plaintiffs' land. The plaintiffs asked for a permanent injunction to prohibit the defendants from maintaining the levee. The plaintiffs also asked for crop damages caused by the flooding. The defendant affirmatively alleged that the plaintiffs dug a ditch across their lands to speed the flow of surface water and create a lake for duck hunting. The defencant maintained that the plaintiffs' damages resulted from the plaintiffs' failure to keep the ditch unobstructed. The defendant also claimed damages for the plaintiffs' cutting his dikes and levees which he contended were on the boundary line, destroying his rice crop. The court first fixed the boundary line and found that the flume protruded in some places on the plaintiffs' property. The court directed that the flume, and levee be

removed where it so infringed. The court stated that a landowner had the right to fend off surface waters by maintaining a flume and levee upon his own lands, but not on the land of others. (Sperling-Florida)

Identifiers: *Administrative regulations, *Coastal waters, Ingress, Egress.

Coastal construction by persons, firms, corporations or local authorities is restricted. All construction is prohibited within fifty feet of the mean high water line at any riparian coastal location. An exception may be obtained by filing an application showing engineering data, shoreline stability, storm tides, and the nature of neighboring structures. Piers may be built unless they will cause erosion. Additionally, these regulations are only applicable to sandy, not vegetative shores. Any coastal structure in violation of this act is considered a public nuisance. The statute also provides that beach restoration projects be undertaken if severe beach erosion has occurred, and if the beach will be destoryed in the immediate future. When such a beach is restored, the added land belongs to the state, but the common-law rights of riparians are preserved. No structure will be permitted to be built on the new land except those required for erosion prevention. Neither shall any use be permitted which may be injurious to the property or the landowners business or person. (Sperling-Florida)

The state of Vermont is authorized to join with the state of New York in a common effort to promote the sound development of the underdeveloped resources of the Lake Champlain Basin. The parties agree that the conservation, utilization, development, management and control of the water and related resources is essential for the public welfare. The commission created by the act shall act as a general forum for the problems of the region, devise solutions to these problems and implement intergovernment coordination and cooperation within the region. It shall also cooperate with the appropriate agencies in regional development, tourism, festivals, exhibitions as well as plan and recommend governmental services which will aid in the growth and prosperity of the region. The commission may also conduct water resources research including the relation of water to other resources, industrial water technology, ground water movement, water demand and general hydrological conditions. The commission shall design a plan for the development of the basin's resources to safeguard its scenic value, including the establishment of Lake Champlain Park. The commission may also regulate advertising, objectionable uses of property, dredging, filling, sewage disposal and navigation within the region. (Silber-Florida)

he legal aspects of public access to municipal eaches are studied. In response to growing popuion and expanding industrialization, American ciety is presently facing increasing difficulty in oviding adequate shoreline recreational facilities meet the public need. In seeking to establish a blic right to beach access, this note reviews the blic trust doctrine and the doctrine of irrevocae dedication, both of which have been successlly used to protect user rights, however, the ope of each has been limited. The Constitution one provides the broad applicability and substanve content necessary to support a successful atck upon discriminatory beach access fees. It apars that the right of public access to shoreline ecreational resources is a fundamental right for e purposes of the equal protection clause and at, therefore, beach access fees should be exmined with extremely strict judicial scrutiny. ven under the traditional, less stringent equal otection standard, exclusionary policies pracced by shorefront municipalities fail to pass the onstitutional test. Descriptors: *Water control, *Water law, *Legal spects, *Water policy, *Jurisdiction, Federal jurisdiction, State jurisdiction, Water rights, Coasts, Shores, Navigable waters, Political aspects, International agreements, Continental shelf, Structures, Pollution control, Environmental aspects, Erosion, Restoration, Hydroelectric power, Facilities, Cooperation, Coordination, Conservation, Management, Development, Channelization, Filling, Dredging.

It is essential to first determine which waters are internal and which comprise the territorial water areas of coastal states, both of which can be distinguished from the high seas which no nation politically controls. Coastal state jurisidiction over territorial waters extends, by international agreement, to the end of the continental shelf. Based upon the 'Commerce Clause' of the United States Constitution, federal jurisdiction extends to the wide range of activities and conditions related to all local, inland and coastal navigable waters. Within the federal scope is included navigation, waterfront construction, environmental water protection, restoration of eroded beaches, flood control, hydroelectric power operations and wildlife and recreational preserves. This federal control does not preclude state and local jurisidiction however. The Coastal Management Act of 1972 emphasizes federal, state and local cooperation in conservation and management of coastal regions. State and local control emphasizes building and developing aspects, filling and dredging, channelization, and control of water bottoms. (Silber-Florida)

BURKE V. COLLEY (QUIET TITLE ACTION INVOLVING ACCRETION).
495 S. W. 2d 699 (Mo. Ct. App. 1973).

Descriptors: *Accretion, *Legal aspects, *Surveys, *Missouri, Patents, Banks, Judicial decisions, Federal government.

Occupiers of land west of the Current River, a non-navigable stream, brought action against occupiers of land east of river to quiet title to certain land east of the river. Defendants claimed adverse possession and acquisition by accretion. The trial court rendered judgment for plaintiffs. The Missouri Court of Appeals reversed and remanded holding that a survey which failed to show that it commenced at a corner established by government was incompetent and inadmissible. The court applied the rule that when the United States surveyed its lands along the banks of the river and sold and conveyed such lands by subdivision, the government patent conveyed the title to all of the lands lying between the meander line and the middle thread of the river unless prior to the patent the government surveyed such lands as subdivisions or expressly reserved them when not surveyed. The court also found the defendants' evidence of adverse possession and accretion was wanted due to lack of proper survey. (Sears-Florida)

PASSAIC VALLEY COUNCIL V. HARTWOOD SYNDICATE, INC. (ACTION TO DETERMINE RIGHTS TO USE OF RESERVOIR).
348 N.Y.S. 2d 883 (Sup. Ct. 1973).

Descriptors: *New York, *Judicial decisions, *Water law, *Water rights, Prescriptive rights, Groundwater, Riparian rights, Relative rights, Competing uses, Reservoirs, Riparian lands, Water utilization, Regulated flow, Impounded waters, Water resources, Water management, Surface waters, Water supply, Recreation, Water storage, Reasonable use, Water allocation, Water demand, Easements.

This court action, under New York State law, was brought by the owner of a portion of a reservoir bed, under deed from a canal company. One of the defendants owned the remainder of the bed and claimed rights in the reservoir pursuant to the canal company's subsequent conveyance of the canal and appurtenances and the company's earlier grant of hunting, fishing and sailing rights. The Supreme Court for Sullivan County held that the company's deed, reserving the reservoir rights, created only an appurtenant easement, the rights in which expired when the canal was abandoned by the company, and that prescriptive rights were not thereby established. It also held that notwithstanding the decision above, the defendant's hunting, fishing and sailing rights were exclusive over the entire reservoir. However, the Court, in sustaining the defendant's exclusive rights to hunting, fishing and sailing over the entire reservoir, could not exclude the plaintiff's bathing and swimming rights in the area of the reservoir he owned. Nor were the defendants entitled to a determination that the owner of the remaining reservoir bed was not entitled to continue to overflow the defendant's lands. (Silber-Florida)

HAMILTON V. DIAMOND (PROCEEDING SEEKING TO HAVE PERMIT TO FILL HUDSON RIVER AT CERTAIN ADDRESS DECLARED ILLEGAL AND VOID).
349 N.Y.S. 2d 146 (Sup. Ct. 1973).

Descriptors: *Water resources development, *Landfills, *Planning, *Erosion control, *Land development, *Permits, New York, Legislation, Legal aspects, Land management, Water quality, Judicial decisions, Natural resources, Public health, Environmental effects, navigable rivers.

Petitioners sought to have a fill permit rescinded in the interest of environmental conservation. Owners of the property had obtained the permit in order to meet a local zoning ordinance and build a residence on the property. Public hearings were held and it was determined that the application was in the public interest and would not adversely affect the health, welfare, and safety of the State, nor its natural resources. The court found the determination neither arbitrary, illegal or an abuse of discretion. On the contrary, there was testimony to the effect that unkept, overgrown property would be developed, the littered shoreline cleared up and river water would be cleansed. Further, erosion would be reduced and the property's tax assessment would be quadrupled. The court also stated that there was no conflict between the rules and regulations of the Commissioner of Environmental Conservation and the provisions of the Constitution and the Environmental Conservation Law. (Sutton-Florida)

CUSTIS FISHING AND HUNTING CLUB V. JOHNSON (BOUNDARY DISPUTE AS TO TITLE TO BED OF A MILL POND).
200 S.E. 2d 542 (Va. 1973).

Descriptors: *Virginia, *Judicial decisions, *Legal aspects, *Riparian rights, *Boundaries(Property), Boundary disputes, Water law, Water rights, Adverse possession, Ponds, Spillways, Water levels.

The parties to this boundary dispute action were adjacent property owners. The Court held that the plaintiff could not establish a prima facie case for a presumed grant of the disputed portion of the pond by proving prior peaceful possession under color of title, since defendants were not mere trespassers, but owners of property adjoining the pond. The defendants thus had a colorable claim to riparian interests extending to the center of the pond. The plaintiff also did not establish adverse possession by employment of caretakers, the posting of no fishing signs, stocking the pond with fish, maintaining and repairing mill dam and spillway, and annually lowering and raising the water level, since such conduct was not inconsistent with the rights of defendants as riparian owners. In addition, the deed did not exclude riparian interests of owner by describing property line as extending along the line of mill pond, for in the absence of express exclusion by deed, an owner adjoining a freshwater pond acquires whatever interest in the pond which his grantor possessed. (Ritchie-Florida)

SCENIC RIVERS.
Va. Code Ann., secs. 10-167 thru 10-175 (1970).

Descriptors: *Virginia, *Water law, *Water policy, *Water utilization, *Conservation, Planning, Land use, Land development, Project planning, Fishlife, Wildlife, Recreation, Shores, Environment, Streams, Dams, Reservoirs, Water resources, Water resources development, Structures, Impoundments, Diversions, Channelization, Canals, Water control, Water quality, Water quality control, Legal aspects, Public rights.

The Scenic Rivers Act is established with the express legislative purpose to conserve rivers,

streams, runs and waterways and their shores and immediate environs. Preservation of certain rivers or sections of rivers for their scenic values is a beneficial purpose of water resource policy. The rivers of natural beauty and high quality should be included within the Act to assure their use and enjoyment for their scenic, recreational, geologic, fish and wildlife, historic, cultural or other values. In all planning for the use and development of water and related land resources including the construction of impoundments, diversions, roadways, crossings, channelization, locks, canals and other uses which change the character of a stream or waterway or destroy its scenic values, full consideration and evaluation of the river as a scenic resource shall be given before alternative plans for use and development are approved. (Silber-Florida)

PENALTIES FOR WATER POLLUTION.
Ill. Ann. Stat., ch. 111 1/2, secs. 1042, 1043, 1044, 1046 (Smith-Hurd Supp. 1973), as amended, act 78-862, secs. 42, 43, 44, 46 (1973) Ill. Pub. Acts.

Descriptors: *Penalties(Legal), *Illinois, *Water pollution, *Environmental control, *Legislation, *Ecology, Law enforcement, Environmental effects, Administration, Abatement, Water quality control, Legal aspects, Pollution abatement, Sewage, Sewage treatment, Water pollution sources, Aquatic life, Waste disposal, Construction, Federal Water Pollution Control Act.

Illinois has enacted statutes providing penalties and fines for acts leading to water pollution. Each violation may result in a civil penalty of $10,000 and a further $1,000 fine for each day the violation continues, as well as payment to the State of a reasonable sum for death of aquatic life. Procedures are set forth by which the Attorney General can obtain injunctive relief against such persons who violate and continue to violate pollution statutes, specifically industrial users, and public sewage works. Authority is granted local law enforcement agencies to enforce the Act. All such violations are classified as misdemeanors. More severe criminal penalties are provided for persons who knowingly violate the provisions of this staute. Any public body created by State law and having jurisdiction over disposal of wastes which has been directed to abate any violation of this statute, shall acquire or construct such facilities necessary to comply with the directive. Any unit of local government operating sewage works may adopt regulations providing for cost-sharing by users of the sewage works, or payments by industrial users, if necessary in order to be eligible for federal grants under the Federal Water Pollution Control Act. (Sutton-Florida)
W74-05797

BIG CYPRESS CONSERVATION ACT.
Fla. Laws 1973, Ch 130, secs 1, 2 to be codified as, Fla. Stat. sec. 380.055.

Descriptors: *Florida, *State governments, *Federal government, *Legislation, Aquifers, Groundwater reservoirs, Groundwater recharge, Watershed management, Wildlife habitats, Water supply, Condemnation, Legal aspects, Federal reservations, Public lands, Parks, Regulation, Estuaries, Water management(Applied).
Identifiers: *Big Cypress Area.

The Big Cypress Area of Florida has a significant impact upon environmental and natural resources both in the state and regionally. The area is one of critical state concern as that term was employed in the Florida Environmental Land and Water Management Act of 1972. The area includes the Federal Big Cypress Fresh Water Reserve, along with contiguous land and water areas ecologically linked with Everglades National Park, the estuarine fisheries of south Florida, and the fresh water aquifer of south Florida. The precise boundaries of the area are to be determined by hearings. The statute also provides for the spending of forty million dollars for the acquisition of property in the area proposed as the Federal Big Cypress National Fresh Water Reserve. Any land acquired is to be donated and conveyed to the federal government, when Congress authorizes the acquisition of the Fresh Water Reserve. The Big Cypress Area is a water storage and recharge area, and is an integral part of the water management district of which the area is a part. The act authorizes the governor and the cabinet to exercise the power of eminent domain to acquire the necessary lands. (Sperling-Florida)

PUBLIC SERVICE COMPANIES--COOKING GAS AND WATER SERVICE.
Conn. Gen. Stat. Ann. secs. 19-65(Supp. 1972), as amended, Act 73-244, secs 19-65 (1973). Pub. Acts of Conn.

Descriptors: *Connecticut, *Statutes, *Public utilities, Water distribution(Applied), Water control, Water consumption, Legal aspects, Public rights, Administration, Public health, Social aspects, Legislation, Water, Water law, Water supply, Water rights, Water policy, Water utilization, Water allocation.
Identifiers: *Administrative regulations.

Connecticut requires that any building, or portion thereof occupied as a home, residence, office, or place of business, be furnished with hot water or water where the express or implied terms of the lease or rental agreement requires such a furnishing. Anyone failing to furnish such water is deemed to be interfering with the comfortable or quiet enjoyment of the premises and may be fined up to one hundred dollars or imprisoned not more than sixty days. No public service company, at the request of any lessor, shall cause the terminating of water service with respect to any leased property unless the lessor furnishes a statement signed by the lessee agreeing to the termination, or a notarized statement by the lessor that the premises are vacant. ENVIRONMENTAL LAW--ZONING--ORDINANCE PROHIBITING FILLING OF WET LANDS ADJACENT TO NAVIGABLE WATERS WITHOUT PERMIT IS CONSTITUTIONAL EXERCISE OF POLICE POWER NOT REQUIRING COMPENSATION.
Harvard Law Review, Vol 86, p 1582-1592, 1973, 56 ref.

Descriptors: *Wisconsin, *Judicial decisions, *Legal aspects, *Water law, *Regulations, Land use, Land development, Wetlands, Land control, Ecology, Environment, Environmental effects, Public policy, Legislation, State governments, Filling, Water policy, Riparian rights, Streams, Rivers, Lakes, Ponds, Channels, Land management, Land reclamation, Conservation, Natural resources, Permits, Zoning.

This article deals with the decision in Just v. Marinette County, 56 Wis. 2d 7, 201 N.W.2d.76 (1972), holding that an ordinance prohibiting the filling of wetlands adjacent to navigable water without a permit is a constitutional exercise of the police powers and does not require payment of compensation. The Wisconsin legislature authorized countries to adopt zoning ordinances regulating the use of shorelands, defined as all lands within 1,000 feet of the normal highwater level of navigable lakes, ponds, and flowages, or within 300 feet of navigable rivers and streams. Subsequently the defendant, Marinette County, enacted this ordinance prohibiting the filling of more than 500 square feet of wetlands. The Wisconsin Supreme Court, reasoning that preservation of the wetlands is an important ecological requirement, held that to require that the owner be compensated for use restrictions imposed on wet lands makes preservation of such areas considerably less likely. It should be noted that other jurisdictions require compensation, keying on the notion that unless payment is made the ordinance is confiscatory. (Silber-Florida)

ENVIRONMENTAL PROTECTION.
Conn. Gen. Stat. Ann. subsections 22a-1, 22a-5, 22a-6, 22a-7, 22a-12, 22a-28, 22a-29, 22a-30, 22a-32, 22a-36, 22a-38 to 22a-45 (Supp. 1973) as amended, act 73-571, subsections 1 to 6, act 73-590, section 1 (1973). Pub. Acts of Conn.

Descriptors: *Connecticut, *Environment, *Watershed management, *Erosion control, *Water resources, *Water supply, Water resources development, Legislation, Enforcement, Local governments, Permits, Inter-agency cooperation, Administration, Water rights, Water quality.

The very broad purpose of the statute is to conserve, improve, and protect Connecticut's natural resources and environment and to control air, land and water pollution in order to enhance the health, safety, and welfare of the people. The Commissioner of the department of environmental protection shall carry out the environmental policies of the state and shall have all powers necessary and convenient to discharge his listed duties. The Commission shall also adopt or amend environmental standards, criteria, and regulations, shall deal with complaints and conduct investigations

and hearing pursuant to said standard. A council on environmental quality has been created and shall submit annual reports concerning their activities. The act declares a state policy of preserving tidal wetlands which are being slowly destroyed. The Commissioner is given the right to inspect such tidal wetland areas at reasonable times and the regulated activities are dealt with concerning applications, permits and hearings if needed. Sections 22a-36 to 22a-45 inclusive are cited as the Inland Wetlands and Watercourses Acts and means to protect these indespensible, irreplaceable natural resources are provided and the statute lists various operations and uses permitted in the wetlands. Municipal participation is encouraged. (Sutton-Florida)

WATER CONVEYANCE: LAWS, ORGANIZATION AND EFFICIENCY,
Colorado State Univ., Fort Collins. Dept. of Economics.
G. E. Radosevich.
Paper presented at the American Society of Civil Engineers National Water Resources Engineering Meeting, Jan. 29-Feb. 2, 1973, Washington, D.C. Meeting Preprint 1906, 21 p, 2 fig, 20 ref. OWRR B-083-COLO(4).

Descriptors: *Water law, *Water rights, Organizations, *Water conveyance, *Prior appropriation, *Institutional constraints, Legal aspects, Efficiencies, Water allocation.
Identifiers: *Legal constraints, *Western U.S.

Water in the western U.S. is allocated and distributed according to the prior appropriation doctrine. This doctrine was developed during the mid-1800's as a solution to conflicts arising between those competing for available stream flows. Few changes have occurred in the substantive or procedural aspects of this law, resulting in a lag between water management technology and the law's capability to incite implementation of these developments. The principal legal concept in the appropriation doctrine which has served as the constraint to effective adoption of more efficient practices within the water conveyance and use systems is the property right in water. The water right is at the heart of the doctrine. To resolve the water management problem in the West, recommendations are suggested for changing or reinterpreting the doctrine governing the exercise of this right. Four basic alternatives exist: do nothing; provide incentives within the legal framework; modify organizational capabilities; or enforce the law strictly. The recommendations will lead to implementation of more efficient water management technology in an attempt to solve the quantity and quality problems existing at the state, interstate, and international levels.

INDIAN WATER RIGHTS: LEGAL VARIABLES IN REGIONAL WATER MANAGEMENT,
California Univ., Los Angeles. School of Law.
G. D. Weatherford.
American Association for the Advancement of Science, 140th Paper presented at meeting, San Francisco, February 1974. 13 p.

Descriptors: *Water law, Indian reservations, Water policy, Water resources development, *Water rights, Pueblo water rights, Appropriation, Equitable apportionment, Legal aspects, Competing uses, Irrigated land, *Reservation Doctrine, Water utilization, Water management(Applied), Non-structural alternatives, Water distribution(Applied), Water allocation(Policy), *Colorado River Basin, Regional analysis.
Identifiers: *Indian Water Rights, *Navajo Indians.

The right of the American Indian to use water has been assumed to be protected by his reserved water rights, defined as furnishing the amount of water necessary to fulfill the purposes for which the affected reservation was created. The validity of this assumption is examined here by using the amount of irrigable land on the reservation as a yardstick. Even if not used currently, it is assumed to be set aside for future use. The actual judicial constraints of reserved water rights, however, are open to argument, with rights functioning as a license to wait, to bargain, or to litigate. When supply greatly exceeds demand, development of Indian water usage may safely be deferred in favor of non-Indian development, in effect being a license to wait, in the sense that Indian use of his apportionment will be exercised as his need arises. When supply is at a level where the Indian water right claim clouds the financial feasibility of a proposed non-Indian project, the Indian tribe can waive its water claim, or a portion of it, for a price, in effect a license to bargain. When such bargaining promises to be less beneficial than the application of the reserved water right, the tribe may litigate for the quantity of water involved, in effect a license to litigate. These three interpretations are discussed within the framework of the Colorado River Basin and the Navajo Indian tribe particularly. (Muller-Arizona)

Changing attitudes on water development and environmental quality are surveyed. The last decade has seen the evolution of widespread public concern over environmental deterioration, bringing on a confrontation with development interests. The causes of this are briefly considered and recommendations to deal with this problem are evaluated. In order to incorporate contemporary attitudes into water development projects, environmental as well as developmental interests must be brought into all aspects of resource planning. Incorporation of public values and attitudes into the decision making process is vital to successful planning. To overcome citizen frustration, cynicism, and disillusionment resulting from lack of real public involvement, and the inadequate staffing of resource agencies, it is recommended that the planning of water projects be completely separated from the construction and regulatory agencies. Also, physical, biological, and social scientists should be part of the planning team together with the traditional engineering and economic input. Methodologies should include the incorporation of environmental quality factors into cost benefit analysis with emphasis on the maximization of social benefits. Simulation models, impact analysis, land use zoning, and resource inventories are new techniques which are beginning to be applied in this area. Examples of both positive and negative planning are cited. (Slattery-Wisconsin)

BIOLOGICAL MANAGEMENT AND CONSERVATION: ECOLOGICAL THEORY, APPLICATION AND PLANNING,
M. B. Usher.
Chapman and Hall: London, England; (Dist in USA by Halsted Press, a division of John Wiley and Sons, Ins: New York, N Y). 1973. 394 p. Illus. Maps. Pr $22.00.
Identifiers: Biological studies, *Conservation, Distribution, *Ecological theory, *Ecosystems, *Management, *Planning, *Scotland(Aberlady Bay region), Statistics, Publications.

Discussions are presented on various aspects involving biological management and conservation. An introductory section discusses the development of man, population and technology, the processes of change and legislative action. The remaining portion of the book is divided into 3 major sections. Part 1, ecological theory, discusses the distribution of organisms in space, the distribution of organisms in time, the concept of the ecosystem, classification of ecosystems and the response of ecosystems to exploitation. Part 2, application, discusses conservation and biological management, conservation and preservation, conservation and education and conservation and recreation. Part 3, planning, discusses the management plan and describes the Aberlady Bay Local Nature Reserve (Scotland) management plant. Two appendixes are also included containing the following information: matrix operations, including definition and names, addition and subtraction, multiplication, inversion and latent roots and vectors; and some commonly used statistics. An extensive list of references is included.--Copyright 1973, Biological Abstracts, Inc.

A report of the Water Management Sector Group of the OECD considers the environmental impact of water management decisions. A brief historic overview of growing environmental impacts and concomitant concern in the world is given. They may be partially explained by growth and change in technology, in world needs and demand, and in the advanced educational level of the public. Environmental impact and public involvement are discussed. Greater understanding of the former has been hindered by imperfect knowledge of the ecosystem, inabilities to quantify impacts, or to reconcile long-run and short-run effects. Suggestions are made to rectify these problems by development of requisite impact data, of models predicting man's impact on the ecosystem, and of gaining assurances that such data would become an integral part of the decision process. To accomplish these tasks, the use of matrix methods which plot environmental impacts, independent review boards, and adversative procedures are discussed. Improved public awareness and involvement to assure that the public interest is served and to avoid adverse reactions at a late stage of project development are emphasized. Recent trends including increasing use of alternative plans, studies of the choice process, and selected institutional changes and their impact on management decisions are described. ENVIRONMENTAL QUALITY ANNUAL REPORT (3RD) OF THE COUNCIL ON ENVIRONMENTAL QUALITY.
Council on Environmental Quality, Washington D.C.

Available from Sup Doc, GPO, Washington, DC, $2.00, and the National Technical Information Service as PB-211 960, $1.45 in microfiche. August 1972. 475 p, 66 tab, 4 map, 12 chart, 5 illus, 2 dwg, 13 photo, 3 append.

Descriptors: Environmental effects, *Governments, *Legislation, *Judicial decisions, *Water pollution, Human population, Distribution patterns, Water demand, Social aspects, Industrial wastes, Oil spills, Treatment facilities, Administration, Regulation, Foreign governments, Oceans, Marine biology.
Identifiers: *Environmental quality, Standing(Legal), *National Environmental Policy Act, Ocean dumping.

The status of and the trends in environmental quality are emphasized, and the interrelationships are examined of population, technology, pollution, and other factors that will shape the future environment. The year's (1971-1972) major developments at the international, federal, state and local levels are discussed. The impact of pollution control costs on fourteen industries as well as on the overall economy is described. A comprehensive analysis of the National Environmental Policy Act (NEPA) and a discussion of national parks are included. Specific coverage includes developments in the area of ocean pollution caused by the atmosphere, rivers, ships, and ocean dumping. There has been expansion at all governmental levels via legislation and regulations affecting water quality, marine sanitation, oil and hazardous substance spills as well as grants for waste treatment facilities. Recent results of judicial decisions including citizen's standing, agency action and industry plaintiffs are discussed. (Conko-Florida)

SCIENTIFIC INFORMATION IN THE DECISION TO DAM GLEN CANYON,
California Univ., Davis. Dept. of Geology.
P. C. Perkins.
American Association for the Advancement of Science, 140th Paper presented at meeting, San Francisco, Feb. 1974. 32 p, 32 ref.

Descriptors: Colorado River, *Damsites, Dams, *Reservoirs, *Engineering structures, *Colorado River Basin, Rivers, *Arizona, Water resources, Water resources development, River systems, Geology, Hydraulic structures, Hoover Dam, Dam construction, Engineering geology, River regulation, Multiple-purpose reservoirs.
Identifiers: *Glen Canyon Dam.

In anticipation of legislative debates over authorization of the construction of a dam to block Glen Canyon, the environmental impacts of the creation of Lake Powell are examined in the light of subprojects of the current Lake Powell Research Project. They were considered also in the 1950's during the debate of the Colorado River Storage Project and even as far back as the 1920's at the time when Glen Canyon was discussed as a possible site for what became Boulder Dam and Lake Mead. The engineering and physical science considerations in the evaluation of the proposed dam are presented. A site evaluation, evaporation estimate, sedimentation analysis and bank storage estimate are included as are comparative developments along the Colorado River. (Muller-Arizona)

APPLICATIONS OF AERIAL PHOTOGRAPHY AND ERTS DATA TO AGRICULTURAL, FOREST AND WATER RESOURCES MANAGEMENT.
Minnesota Univ., St. Paul. Inst. of Agriculture Remote Sensing Lab.
Available from NTIS, Springfield, Va 22151 as N73-31357 for $3.00 printed copy; $1.45 microfiche. Research Report 73-1, July 1973. 86 p. NASA Grant NGL 24-005-263.

Descriptors: *Remote sensing, *Infrared radiation, *Plant pathology, Diseases, Plant diseases, Fungi, *Mapping, *Aerial photography, *Data collections.

Remote sensing techniques were studied for use in detecting forest disease, determining water quality in peat, classifying forests, detecting saline soils, and surveying insect damage in corn and alfalfa. Infrared aerial photography used with density slicing techniques was the most successful of the methods studied for detecting crop damage. For crop identification and water-quality monitoring, small-scale infrared aerial photography can be very economical. (See W74-05516 thru W74-05521) (Knapp-USGS)
W74-05515

FOREST DISEASE DETECTION AND CONTROL,
Minnesota Univ., St. Paul. Inst. of Agriculture Remote Sensing Lab.
D. W. French, R. W. Douglass, and M. P. Meyer.
In: Applications of Aerial Photography and ERTS Data to Agricultural, Forest and Water Resources Management. Institute of Agriculture Remote Sensing Laboratory Research Report 73-1, Chapter 1, p 1-22, July 1973. 7 fig, 3 ref. NASA Grant NGL 24-005-263.

Descriptors: *Remote sensing, *Infrared radiation, Plant pathology, Diseases, *Plant diseases, Fungi, Mapping, *Aerial photography, Rots, Minnesota.
Identifiers: *Mistletoe infection, *Plant rot.

Dwarf mistletoe infections as small as 0.1 acre were visible on infrared color film at scales as small as 1:118,000. Detection of 0.1 acre centers was easy at scales of 1:31,680. Individual aspen trees killed by the hypoxylon fungus were detected with relative ease at scales of 1:6,000. Armillaria root rot in red pine was detectable only after the trees had died and the foliage had turned from green to brown. (See also W74-05515) (Knapp-USGS)
W74-05516

EVALUATION OF PEATLAND WATER TABLE ELEVATION AND WATER QUALITY INDICATORS,
Minnesota Univ., St. Paul. Inst. of Agriculture Remote Sensing Lab.
A. C. Mace, Jr.
In: Applications of Aerial Photography and ERTS Data to Agricultural Forest and Water Resources Management. Institute of Agriculture Remote Sensing Laboratory Research Report 73-1, Chapter 2, p 23-34, July 1973. 5 fig, 1 tab. NASA Grant NGL 24-005-263.

Descriptors: *Remote sensing, *Peat, *Water table, *Water quality, *Aerial photography, Infrared radiation, Mapping, Swamps, Wetlands, Sampling, Algae, *Minnesota.
Identifiers: *Chippewa National Forest(Minn).

Remote sensing techniques were evaluated for monitoring water table elevation of peatland areas for flood prediction and water quality changes. Density values of color infrared photography were significantly correlated with water table elevation. Correlation of film density with water table depth was not significant due to the undulating surfaces of peatlands. Identification of aquatic vegetation and population by image enhancement and density level slicing was not successful although sufficiently encouraging to modify sampling techniques. Large scale photography (1:3,000-6,000), precise location of sampling points, and time of sampling are modifications which should improve results. (See also W74-05515) (Knapp-USGS)
W74-05517

FOREST VEGETATION CLASSIFICATION AND MANAGEMENT,
Minnesota Univ., St. Paul. Inst. of Agriculture Remote Sensing Lab.
R. W. Douglass, and M. P. Meyer.
In: Applications of Aerial Photography and ERTS Data to Agricultural, Forest and Water Resources Management. Institute of Agriculture Remote Sensing Laboratory Research Report 73-1, Chapter 3, p 35-52, July 1973. 5 fig, 7 tab, 4 ref. NASA Grant NGL 24-005-263.

Descriptors: *Remote sensing, *Aerial photography, *Forestry, Infrared radiation, Forest management, Mapping, *Classification, Surveys, Land management, *Minnesota.
Identifiers: *Chippewa National Forest(Minn).

Foresters were able to classify vegetation species to an 85% level of accuracy on 1:120,000 color infrared fall photography. Accuracy was less with ordinary color photography and summer season photography (color and infrared color). Small-scale aerial photography for first stage (and, in some cases, second stage) multistage forest vegetation classification and sampling was very useful. Significant savings in aerial photo procurement and interpretation costs are possible for certain uses of very small-scale aerial photography in lieu of conventional (larger) scales of forest photography. (See also W74-05515) (Knapp-USGS)
W74-05518

DETECTING SALINE SOILS IN THE RED RIVER VALLEY, MINNESOTA, BY REMOTE SENSING TECHNIQUES,
Minnesota Univ., St. Paul. Inst. of Agriculture Remote Sensing Lab.
R. H. Rust, and B. H. Gerbig.
In: Applications of Aerial Photography and ERTS Data to Agricultural, Forest and Water Resources Management. Institute of Agriculture Remote Sensing Laboratory Research Report 73-1, Chapter 4, p 53-68, July 1973. 6 fig, 3 tab, 11 ref. NASA Grant NGL 24-005-263.

Descriptors: *Saline soils, *Remote sensing, *Infrared radiation, *Aerial photography, *Minnesota, Soil surveys, Mapping.
Identifiers: *Red River Valley(Minn).

Photo imagery was evaluated for detection and delineation of saline-affected soil areas in the Red River Valley of Minnesota. Two 10-mile transects crossing the common range of soil conditions were studies. Ground truth consisted of mapping the soils in the saline-affected area at a 1:20,000 scale and making conductivity measurements in grain and fallow fields in saline and nonsaline areas. Kodachrome 35 mm imagery was used to broadly outline affected areas. Density slicing techniques were employed on color infrared imagery in a qualitative analysis. After separation of cultural patterns, identification of saline-affected areas was greatly facilitated by image analysis. (See also W74-05515) (Knapp-USGS)
W74-05519

CORN DEFOLIATION SURVEYS,
Minnesota Univ., St. Paul. Inst. of Agriculture Remote Sensing Lab.
H. C. Chiang, and M. P. Meyer.
In: Applications of Aerial Photography and ERTS Data to Agricultural, Forest and Water Resources Management. Institute of Agriculture Remote Sensing Laboratory Research Report 73-1, Chapter 5, p 69-75, July 1973. 2 fig, 10 ref. NASA Grant NGL 24-005-263.

Descriptors: *Remote sensing, *Infrared radiation, *Plant diseases, Defoliants, Crops, *Corn(Field), *Minnesota.
Identifiers: *Defoliation, *Insect damage.

Remote sensing was studied for use in detecting crop-insect infestation by aerial photography of artificial defoliation in corn. Defoliation of plant tops was easily detected, while that on the base was less so. Aero infrared film with a Wratten 89B filter gave the best results. Morning flights at a scale of 1:15,840 are recommended. Row direction, plant growth stage, and time since defoliation were not important. Image enhancement significantly improved the threshold of defoliation recognition, but added a cost factor which may not be acceptable in terms of commercial remote sensing survey techniques. (See also W74-05515) (Knapp-USGS)
W74-05520

ALFALFA CROP PRODUCTIVITY ANALYSIS,
Minnesota Univ., St. Paul. Inst. of Agriculture Remote Sensing Lab.
D. K. Barnes, and M. P. Meyer.
In: Applications of Aerial Photography and ERTS Data to Agricultural Forest and Water Resources Management, Institute of Agriculture Remote Sensing Laboratory Research Report 73-1, Chapter 6, p 76-82, July 1973. 5 fig, 3 ref. NASA Grant NGL 24-005-263.

Descriptors: *Remote sensing, *Crops, *Alfalfa, Crop production, *Plant diseases, *Aerial photography, *Minnesota.

Sequential, ERTS-compatible multispectral, multiscale 70 mm aerial photography on a study area containing five varieties of alfalfa was studied to determine whether aerial remote sensing techniques could differentiate insect and disease injury. Visual analysis of 1:6,000 to 1:15,000 scale color infrared aerial photography could distinguish relative pest injury. An improvement in pest injury detection was found with image enhancement (density slicing) of the color infrared. There may be a correlation between film density readings and crop yields. Descriptors: *Remote sensing, *Review *Satellites(Artificial), Photography, Infrare radiation, Radar, Microwaves.
Identifiers: USSR.

Remote sensing from satellites includes televisio photography, heat observation in the infrared, ar microwave radiometry. Photography in the visib range of the spectrum gives normal photograp and the television images which, presenting lar sections of surface, are extremely informative f analysis of the distribution of cloud cover, veget tion, and geologic structures. Photography in th infrared region of the spectrum shows a picture cloud distribution on the night side of the plan and makes it possible to judge the thermal state the earth's surface. Microwave sensing makes possible to determine the moisture and water co tent in the thickness of atmosphere, to dete icebergs, to estimate icy state and the surface co ditions of the oceans. Radar is used to study th hydrographic network: to detect river systems, determine the area of catchment, the perimeter basin, the extent of tributaries, the slope of th slopes of valleys. In geologic studies, radar revea the geologic structure and composition of bedroc (Knapp-USGS)

Descriptors: *Aerial sensing, *Aerial photo raphy, *Aircraft, *Satellites(Artificial), Camera Electronic equipment, Mapping, Spe trophotometry, Maps, Exploration, Exploitatio Terrain analysis, Colorimetry, Water pollutic sources, Federal government, Depos tion(Sediments), Flood control.

New sensing devices and high flying satellit present great promise in the fight to sa resources. Hidden sources of pollution can be d tected and new fresh water sources can b discovered. The key to this involves remo sensing. The most advanced cameras now used aircraft research work have color sensitive lense Different plants, trees, etc. show up as differe color signatures. Satellites are much cheaper t use than aircraft as they are not dependent c good flying weather and do not need a pilot. Aer photographs enable one to map sediment depos tion easily because the entire sediment plume ca be seen at one time. Future satellite surveillanc can reveal thermal pollution, tankers dischargi oil waste, as well as floating algae and foam. Su veys of snow cover and melting patterns will mak flood predictions more accurate. Changing wat temperatures can also be detected as the temper ture of the sea has marked effects on the weathe (Sperling-Florida)

BASE OF FRESH GROUND WATER--APPROXIMATELY 3,000 MICROMHOS--IN THE SACRAMENTO VALLEY AND SACREMENTO-SAN JOAQUIN DELTA, CALIFORNIA,
Geological Survey, Menlo Park, Calif.
C. F. Berkstresser, Jr.
Water Resources Investigation 40-73, 1973. 1 sheet, 1 map, 40 ref.

Descriptors: *Groundwater, *Saline water-freshwater interfaces, *California, Salinity, Water quality, Valleys, Deltas, Aquifers, Hydrogeology, Hydrologic data.
Identifiers: San Joaquin Delta, Sacramento Valley.

The base of fresh groundwater is delineated in the Sacramento Valley and the Sacramento-San Joaquin Delta, California. Changes in the altitude of the base of freshwater due to water-resources development can be monitored, and the freshwater zone can be considered in selecting sites for deep-well injection of liquid wastes. Also, altitudes of the base of freshwater can be used for groundwater model studies. About 4,000 chemical analyses were examined and 1,500 were used to corroborate information provided by 900 electrical logs. Fresh groundwater in the study area is contained almost exclusively in unconsolidated or poorly consolidated continental and volcanic deposits of Pliocene to Holocene age. The deposits have a maximum thickness of about 3,600 feet, but generally are much thinner. The surface of the base of freshwater is uneven and generally reflects the configuration of continental and volcanic deposits. Deeper geologic structures such as faults and gas reservoirs are rarely reflected in the shape of the base. Along the east margin of the valley, the basement complex of Mesozoic age delineates the lower limit of freshwater. Along the west margin, marine bedrock of Eocene age or older probably delineates the lower limit. In several parts of the valley, saline water zones are found near land surface. (Knapp-USGS)

8A. Structures

RESERVOIRS, THEIR EFFECT ON NATURE AND THE ECONOMY, AND PRINCIPLES OF CONSTRUCTION (VODOKHRANILISHCHA, IKH VLIYANIYE NA PRIRODU I KHOZYAYSTVO, PRINTSIPY SOZDANIYA),
A. B. Avakyan.
Akademiya Nauk SSSR Vestnik, No 11, p 42-51, November 1973. 2 fig, 1 tab.

Descriptors: *Reservoirs, *Multiple-purpose reservoirs, *Reservoir construction, Reservoir storage, Usable storage.
Identifiers: *USSR.

Based on estimates made at the USSR Academy of Science's Institute of Water Problems, the total storage of 10,000 of the world's reservoirs already constructed or under construction is about 5,000 cu km or more than four times the average volume of water in stream channels (1,200 cu km). The useful storage is 3,000 cu km, and the area of the reservoir water surface is 400,000 sq km. According to data of the B. Ye. Vedeneyev All-Union Scientific Research Institute of Hydraulic Engineering, the Soviet Union has today about 1,000 reservoirs with a storage of more than 1 million cu m each. The total storage of these reservoirs is 831 cu km, and their useful storage is 406 cu km, which is about 16% and 13%, respectively, of the total and useful storage of the world's reservoirs. More than 98% of the total and useful storage of USSR reservoirs is concentrated in 150 reservoirs having a storage of more than 100 million cu m. By the year 2000 the total storage of the world's reservoirs will increase to 10,000-12,000 cu km and the useful storage will increase to 6,000-7,000 cu km.

Economic and social considerations which determine the need for reservoir construction include public water supply, irrigation, hydroelectric power, navigation, flood mitigation, and recreation. Global distribution of major world reservoirs with a storage of more than 10 billion cu m is mapped, and the total and useful storage of major world reservoirs with a storage of more than 30 cu km is graphed. Basic objectives in the study of problems relating to reservoir design and multipurpose use are outlined. (Josefson-USGS)

BEACH EROSION CONTROL PROJECT, DELRAY BEACH, FLORIDA (FINAL ENVIRONMENTAL IMPACT STATEMENT).
Army Engineer District, Jacksonville, Fla.
Available from National Technical Information Service, Springfield, Va, 22151, as EIS-FL-73-0414-F, for $5.00 paper copy, $1.45 microfiche. November 1972. 60 p, 1 map, 8 photo, 2 tab, 2 append.

Descriptors: *Environmental effects, *Dredging, *Erosion, Deterioration, Sediments, Fish, Sessile algae, Beach erosion, Atlantic Ocean, *Florida, Water quality, Federal government, Coasts, Comprehensive planning.
Identifiers: *Environmental Impact Statements, *Delray Beach(Fla), Coastal zone management.

This study deals with beach erosion in the Delray Beach to Boca Raton Inlet. The project consists of the restoration of three miles of Atlantic Ocean Shoreline in Florida. Periodic nourishment will be required to compensate for erosion losses throughout the fifty year life of the project. About 1.8 million cubic yards of material will be dredged from offshore and placed on the beach. The beach will be closed at this time. The dredging will temporarily degrade water quality, cause the beach to be temporarily closed to public use, and will destroy most benthic animals in bottom sediments and cover those in the beach nourishment area. This proposed plan is the only economically feasible one. Fish will be less affected by the project than the sessile invertebrates. The overall impact will probably be insignificant as the offshore borrow area is not near any productive reefs. Increased turbidity will only be of short duration. (Daniels-Florida)

SHORELINE CONSTRUCTION FOR ARTIFICIAL WATER BODIES,
Stabilization Chemicals, Anaheim, Calif. (assignee)
J. H. Glenn.
U.S. Patent No. 3,768,266, 4 p, 5 fig, 8 ref; Official Gazette of the United States Patent Office, Vol 915, No 5, p 1617, October 30, 1973.

Descriptors: *Retaining walls, *Concrete, *Shore protection, Water resources, *Erosion control, Plastics.
Identifiers: *Artificial water bodies.

Excavation of a trench to outline the periphery of the water body constitutes the first step in construction of the artificial shoreline. The dimensions of the trench may be adapted to specific requirements, although a depth of about 4 feet and a width of about 8 to 10 inches are the preferred dimensions of the trench. The flat side of a premolded plastic section of perhaps 8-15 feet in length is then secured to an upper portion of the trench sidewall, its opposite side being provided with surface irregularities or inequalities closely approximating natural sand or rock formations. The plastic section is thinner than the trench width so as to form an opening between the plastic section and the trench wall. Concrete is then poured into the trench through the opening and will first fill up the bottom portion of the trench below the plastic section and will thereupon occupy the opening in the trench opposite the exposed irregular surface of the pre-molded plastic section. The upper portion of the concrete will thus receive the mirror image of the irregular surface of the plastic section. The plastic section is readily removed from the trench and the irregular surface formed of concrete is exposed. (Sinha-OEIS)

CELLULAR-BLOCK-LINED GRADE CONTROL STRUCTURE,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
B. P. Fletcher, and J. L. Grace, Jr.
Available from NTIS, Springfield, Va. 22151 as AD-766 692, Price $3.00 printed copy; $1.45 microfiche. Miscellaneous Paper H-73-7, August 1973. 23 p, 2 fig, 3 plate, 10 photo.

Descriptors: *Hydraulic models, *Drops(Structures), Canals, *Concrete structures, Channels.

A practical and inexpensive method of providing for a sudden change in grade of the invert of a trapezoidal channel in order to establish vertical control in a drainage basin subject to or experiencing gully scour was studied in a hydraulic model. A considerable cost savings can be realized if a cellular-block-lined structure can be used in lieu of a conventional reinforced-concrete drop structure. Cellular-block-lined grade control structures can be designed provided the geometric similarity is preserved, the control or throat section is sized sufficiently small to prevent excessive accelera tion and drawdown of flow, and the followin maximum or limiting conditions are not exceeded an approach channel depth less than or equal t the exit channel flow depth; a critical depth o flow in the throat section less than or equal to 4. ft; a critical velocity of flow in the throat sectio less than or equal to 8.9 fps; and a total drop in th elevation or grade change less than 4.0 ft. (Knapp USGS)

HOUSTONHANNEL, GALVESTON BAY TEXAS: REPORT 1--HYDRAULIC AND SALINI TY VERIFICATION,
Army Engineer Waterways Experiment Station Vicksburg, Miss.
W. H. Bobb, R. A. Boland, Jr., and A. J. Banchett
Available from NTIS, Springfield, Va. 22151 a AD-766 693, Price $3.00 in printed copy; $1.45 i microfiche. Technical Report H-73-12, Augus 1973. 59 p, 4 fig, 42 plate.

Descriptors: *Hydraulic models, *Dredging *Saline water intrusion, Salinity, Gulf of Mexico *Channels, Canals, Inland waterways, *Texas.
Identifiers: *Houston Ship Channel(Tex).

The Houston Ship Channel model is a fixed-be model constructed to linear scale ratios of 1:60 horizontally and 1:60 vertically. It is used t reproduce a portion of the Gulf of Mexico ac jacent to the Galveston Harbor Entrance, the Ga veston Bay complex, including Trinity Bay in it entirety, East Bay, a portion of West Bay, th Houston Ship Channel to its upstream boundary i the City of Houston, Texas, and Buffalo Bayo from the Houston Ship Channel turning basin t the confluence of White Oak Bayou. The model i equipped with necessary appurtenances for the ac curate reproduction and measurement of tide tidal currents, salinity intrusion, freshwater in flow, density effects, shoaling, and other impor tant prototype phenomena. The purpose of th model is to determine if the cost of maintenanc dredging can be reduced by proposed plans involv ing channel realignments, partial or complete di ing of connecting bays, sediment traps, dikes i Galveston Bay, local contractions, enlargement and other remedial measures. Model verificatio tests were conducted to make certain that th model hydraulic and salinity regimens were i satisfactory agreement with those of the prot type. The agreements attained are satisfactory; th model can be used to predict behavior of th prototype. (Knapp-USGS)

SELF-CLOSING IRRIGATION PIPE VALVE,
Agricultural Research Service, Fort Collins, Colo
H. R. Haise, and M. L. Payne.
Journal of the Irrigation and Drainage Divisior American Society of Civil Engineers, Vol 98, N IR3, p 517-522, September, 1972. 5 fig, 5 ref.

Descriptors: *Irrigation systems, *Distributio systems, *Valves, *Remote control, Turnout *Pipe flow, Pipes, Irrigation engineering, Irrig tion design.

A low-head self-closing hydraulic diaphragm i rigation valve that operates on water pressure i the pipe distribution system has been develope and successfully tested. The valve requires a pil valve and control lines for remote operation. Pre sure head in the system plus velocity head from pitot tube, and the differential area of the valv combine to make closure possible. Possible use include control of reservoir outlets, water release from riser valves, and routing water in storm sewers to maximize design capabilities. No outsid power source is required. DESIGNS FOR RUBBLE-MOUND BREAKWATER REPAIRS NAWILIWILI HARBOR, NAWILIWILI, HAWAII. HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
R. A. Jackson, R. Y. Hudson, and J. G. Housley.
Available from NTIS as AD-762 184 PC$3.00, microfiche $1.45. Miscellaneous Paper No. 2-377, February 1960. 67 p, 26 photos, 24 plates.

Descriptors: *Hydraulic models, *Breakwaters, *Harbors, Hawaii, Attenuation.
Identifiers: Rubble-mound breakwaters, Kawai(Hawaii).

A 1:55.5 scale hydraulic model was used to obtain data from which competitive designs could be determined for the repair of the damaged breakwater at Nawiliwili Harbor, Island of Kauai, Hawaii. Proposed designs involved protective cover layers of either salvaged quarrystone, tetrapod, or tribar armor units. It was concluded that: it was not feasible to repair the damaged breakwater with the quarrystones available at Nawiliwili; repair sections constructed of either tribars or tetrapods would provide a stable breakwater; because the height of the selected breakwater crown is low compared with the height of the design waves, it will be necessary to protect the crown of the breakwater from overtopping waves with a concrete cap. The seaward face of the concrete cap should be vertical so that wave action will not wash armor units over the crest of the breakwater. (Sinha-OEIS)

LOCATION AND DESIGN OF WAVE ABSORBER, GARY HARBOR, INDIANA. HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
J. G. Housley.
Available as AD-760 936 PC$3.00, microfiche $1.45. Technical Report No. 2-509 Prepared for United States Steel Corporation, June 1959. 70 p, 8 fig, 8 tab, 8 ref, 17 photos, 18 plates.

Descriptors: *Hydraulics, *Bulkheads, Navigation, *Harbors, Indiana, Attenuation.
Identifiers: Wave absorbers, Gary(Indiana).

Hydraulic model tests were conducted to determine whether navigation conditions in Gary Harbor would be adversely affected by waves reflected from an adjacent vertical-wall bulkhead proposed for construction by the United States Steel Corporation, Gary, Ind. From tests of a 1:150 scale, fixed-bed model of the harbor, it was determined that the proposed bulkhead would reflect waves that would be hazardous to navigation, and that a 4450-ft-long rubble wave absorber would have to be placed along the structure to reduce the heights of reflected waves in the navigation channel to the level of the waves that now occur in the channel. For the waves used in this study an absorber composed of two layers of quarrystone armor units on a 1-on-3.2 slope is required to insure that the heights of waves reflected from the proposed bulkhead into the navigation areas would not be greater than 2 ft. (Sinha-OEIS)

DESIGN OF QUADRIPOD COVER LAYERS FOR RUBBLE-MOUND BREAKWATERS. HYDRAULIC LABORATORY INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
R. A. Jackson.
Available from NTIS as AD-762 185 PC$3.00 microfiche $1.45. Miscellaneous Paper No. 2-372, January 1960. 14 p, 2 tab, 4 photos, 3 plates.

Descriptors: *Breakwaters, Hydraulics, Structure, Shore protection.
Identifiers: Rubble-mound breakwaters, Quadripods, Armor units.

The information presented represents all test results concerning the stability characteristics of quadripod armor units available as of October 1959. The comprehensive testing program includes tests to determine the relative stability and efficacy of various special shapes of armor units for rubble-mound breakwaters. The stability and porosity of quadripods and tetrapods are essentially the same. Values for K sub delta (an experimental coefficient which is a function of the shape delta of individual armor units and the manner of placing them) and P (the porosity is a percentage) recommended for quadripods placed pell-mell with 2 layers was 8.3 and 50%, respectively. (Sinha-OEIS)
W74-05709

NIVIGATION IMPROVEMENTS IN BARNHART ISLAND-CORWALL ISLAND REACH, ST. LAWRENCE RIVER: HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
E. B. Lipscomb, and A. M. Gill.
Available from NTIS as AD-761 720 PC$3.00 microfiche $1.45. Technical Report No. 2-576, August 1961. 127 p, 3 fig, 55 tab, 29 plates.

Descriptors: Channel flow, *Channel improvement, St. Lawrence River, *Hydraulic models, *Nivigation.

The U.S. St. Lawrence Seaway Development Corporation resorted to hydraulic models to study the channels and other improvement features in the Cornwall Island reach. The investigations were concerned primarily with the improvement of South Channel, a reach about 7 miles long, to satisfy navigation criteria and also to assure continuation of the present 14-ft-draft navigation during construction of improvement plans. Interrelated with the South Channel improvement was the enlargement of North Channel to maintain the established discharge distribution and to obtain maximum benefits for navigation and power. Two models were used in the investigations. Plans were developed which would provide the desired 27-ft navigation depth in South Channel by widening the alignment of the channel on both sides and slightly deepening the natural bed in several places. Plans were also developed for compensating works in North Channel which would maintain the required natural distribution of flow between the channels with the South Channel improvements completed. Tests were made of the effects of various stages of construction of the improvement plans on 14-ft-draft navigation, and a construction schedule that would assure the continuation of navigation at this depth was developed. (Sinha-OEIS)

Descriptors: *Hydraulics, *Loads(Forces), *Flow around objects, Flow separation, Fluid mechanics, *Hydraulic structures.

A two-dimensional wall of variable thickness protruding from a plane boundary is a basic geometrical configuration encountered in many instances of flow-induced structural vibrations in hydraulic structures. The characteristics of the dynamic forces acting upon the face of the wall parallel to the boundary were studied. The effects of cavitation and of forced periodic oscillations of the wall upon the force fluctuations were investigated as functions of cavitation number and amplitude and frequency of oscillation. There may be several control mechanisms for flow-induced vibrations because of flow reattachment, cavitation, or wall displacement. (Knapp-USGS)

Blume (John A.) and Associates, Engineers, San Francisco, Calif.
C. K. Chen, and J. A. Roberson.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 100, No HY1, Paper 10257, p 53-67, January 1974. 18 fig, 13 ref, append.

Descriptors: *Turbulent flow, *Pipe flow, *Roughness(Hydraulic), *Reynolds number, Drag, Fluid mechanics, Hydraulics, Shear stress, Turbulence, Pressure drag.

An experimental investigation was made of the turbulent flow in a pipe roughened with hemispheres. The roughness concentration was varied by changing the size of roughness elements which were uniformly distributed on the smooth boundary. Measurements included intensity of turbulence, macroscale of turbulence, Reynolds stress, mean velocity, pressure gradient, drag force, and shear stress on the smooth boundary. Turbulence and velocity measurements were confined to a vertical plane through the wake center line. In the region above the tops of the roughness elements the distributions of the normalized intensities of turbulence, the Reynolds stress, and the macroscale of turbulence in roughened pipe flow are about the same as in smooth pipe. In the region below the tops of the roughness elements at a given Reynolds number and for an increase in the relative roughness, there are corresponding decreases in the normalized longitudinal intensity of turbulence and the Reynolds stress. In the region behind the roughness elements at a given distance above the boundary, the maximum magnitudes of the normalized intensities of turbulence and the Reynolds stress have initially high values. They then decay and approach essentially constant values. The turbulence macroscale is dependent upon the Reynolds number and decreases with an increase in the relative roughness. (Knapp-USGS)

THREE-DIMENSIONAL TURBULENT WALL JETS,
Alberta Univ., Edmonton. Dept. of Civil Engineering.
N. Rajaratnam, and B. S. Pani.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 100, No HY1, Paper 10294, p 69-83, January 1974. 15 fig, 1 tab, 17 ref, append.

Descriptors: *Jets, *Turbulent flow, Hydraulic similitude, Shear stress, Boundary layers, Turbulent boundary layers, Hydraulics, *Nozzles.

Experiments on three-dimensional turbulent bluff wall jets originating from circular, elliptic, square, rectangular, and equilateral triangular nozzles show that in the region of fully developed flow, the distribution of the axial velocity in the central as well as transverse planes are similar. The velocity scale varies inversely with the axial distance whereas the length scales vary linearly with the axial distance from the respective virtual origins. The square root of the area of the nozzle serves as a convenient length scale in correlating the data for nozzles of different shapes. (Knapp-USGS)

Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 100, No HY1, Paper 10261, p 119-136, January 1974. 10 fig, 2 tab, 14 ref, append. EPA Grant WP-00837.

Descriptors: *Seiches, *Hydraulic similitude, *Hydraulic models, *Lakes, Model studies, Waves(Water), Fluid friction, Mathematical models.
Identifiers: *Damping(Waves).

Decay of mass oscillations may be used to determine the scale of friction in a hydraulic model of closed basins. A mathematical model for the damping of the uninodal seiche in a rectangular closed basin utilizing the one-dimensional hydrodynamic channel equation was used as the analytic approach to the problem. Experimental data were compared with the analytical results. The similitude requirement for frictional damping requires equality of the Froude number and the Proudman number in the model and prototype. Through adjustment of boundary friction, model verification can be accomplished when these criteria cannot be met. (Knapp-USGS)

BUBBLY TWO-PHASE FLOW IN HYDRAULIC JUMP,
Toronto Univ. (Ontario). Dept. of Mechanical Engineering.
F. J. Resch, H. J. Leutheusser, and S. Alemu.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 100, No HY1, Paper 10297, p 137-149, January 1974. 11 fig, 1 tab, 6 ref, append.

Descriptors: *Hydraulic jump, *Air entrainment, Supercritical flow, Aeration, Critical flow, *Open channel flow.
Identifiers: *Multiphase flow.

Air-entraining roller zones are involved in hydraulic umps in open channels. Hot-film anemometry techniques were used to study these zones. The two phases (air versus water) were identified by a signal threshold. Data are presented on void ratio and average size and statistical size distribution of the entrained air bubbles for jumps with and without fully developed inflow. The state of flow development of the supercritical stream entering the jump has a significant bearing on the resulting flow configuration within the jump body and thus, on the air-entraining capacity of the hydraulic jumps. R. L. Stoy, M. H. Stenhouse, and A. Hsia.
Journal of the Hydraulics Division, Americ Society of Civil Engineers, Vol 99, No HY9, Pro Paper 9999, p 1585-1597, September, 1973, 8 fi 12 ref, 2 append. OWRR/A-050-CONN(1), 1 0001-3807.

Descriptors: Hydraulics, *Hydrodynamics, *Jet Buoyancy, Entrainment, *Vortices, Subsurfac flow, Discharge(Water), Heated water, Powe plants.
Identifiers: *Fluid Flow, *Submerged jets.

The results of an experimental investigation of th discharge of submerged slot jet near a free surfac are presented. In the thermal modeling of sul merged power plant discharges, a vortex which a pears between the jet discharge and the free su face or bottom surface is primarily responsible f jet deflection by causing a reduced pressure c one side of the jet. These results are compared an analysis which is developed to predict the j trajectory, velocity profile, and temperatu profile and the effects of jet submergenc velocity, and buoyancy are studied. The uniqu feature of the submerged slot jet is the presence a confined vortex which acts to move the jet to th surface. The conclusions are: a submerged slot j may be used to contain a pool of heated water ne the jet outlet because of the entrapped vortex; th Froude number is not a significant paramet while the submergence ratio and Richardso number are important in determining the jet patl and the jet path can be accurately predicted by th analysis which includes the effect of the reduce pressure caused by the vortex presenc (Dietchman-Connecticut)

Identifiers: *Environmental Impact Statements *Lake Havasu(Ariz).

This project involves the construction of th Havasu Intake Channel, Pumping Plant an Buckskin Mountains Tunnel on Lake Havasu i Arizona. These facilities will enable water to b pumped from the Colorado River at Lake Havas to the Central Arizona Project service area. A long-term average of 1.2 million acre feet of wate

ill be pumped annually from Lake Havasu for ıultiple-purpose uses. This new supply of water ill be used to provide flexibility in meeting the emand for water imposed by municipal, industri-, and agricultural users. Construction of the pro-ct will have minimum effect on the environment f the construction site. The aesthetic value of the nmediate area will be altered during construction ıd partially restored upon completion. The pro-ct will result in a minimal impact to the biota of ıe area. About 200 acres, mostly desert land, will e needed for construction. Alternatives con-dered included other diversion points, alternate ater sources, alternatie power sources, selection f only individual segments of the project and no ction at all. (Conko-Florida)

dentifiers: *Hydraulic fracturing, Zoned dams.

he phenomenon of hydraulic fracturing in dams as studied under carefully controlled laboratory onditions. An analytical investigation determined he conditions under which the stresses in the ores of zoned dams is reduced sufficiently by rching so that hydraulic fracturing can occur. nalyses were also performed to examine the ef-ectiveness of various countermeasures which can educe the arching and the likelihood of hydraulic racturing. Hydraulic fracturing involves tension ailure, with formation of a crack or fracture on ıe plane of maximum tensile stress. The tensile trengths of clays and silts used as core materials re so small that they may be disregarded. Under onditions of nonuniform stress, hydraulic frac-ıring can occur progressively rather than sud-enly. Initiation of hydraulic fracturing at the up-tream face of the core in a dam thus does not ecessarily mean that the fracture will propagate ntirely across the core. Hydraulic fracturing is ıore likely in a high dam than in a low dam. The kelihood of hydraulic fracturing may be reduced y making the core wider, compacting the core at a ower water content, using transition zones which re less stiff than the shells, and using a sloping ore rather than a central core. Descriptors: *Earthquake, *Foundation investigations, Earthquake engineering, Computer programs, Seismic design, Structural design, Finite element analysis, Mathematical models.

A computationally efficient procedure for the linear earthquake analysis of structure-foundation systems is specially suited to finite element solutions of complex shaped structures on large, layered foundations. The procedure is very general in scope, being applicable to a large variety of structure-foundation interaction problems. An explicit formulation of the procedure is presented for a plane strain idealization of a dam foundation system. The procedure utilizes a substructure approach. The foundation is analyzed first, independently of the structure, to obtain its frequency dependent compliance characteristics at the connection nodes with the structure. Equations of motion for the structure are then written, in the frequency domain incorporating the effect of the foundation, the input to the problem being the freefield motion of the structural base. The substructure approach allows a more detailed modeling of the structure, at the same time resulting in a greater flexibility in the selection of the analysis procedure for the foundation and a greater efficiency in numerical computation. The frequency dependent equations of motion for the structure are solved very efficiently by transformation to a generalized coordinate system (Ritz Method), where a few generalized shapes can adequately express the structural response. It is shown that the normal mode shapes of an associated linear system--one that takes the static values of the foundation compliances--serve extremely well as the sought generalized shapes. A computer program performs the analysis. (Knapp-USGS)

S. E. Ogden.
U.S. Patent No. 3,783,623, 4 p, 9 fig, 7 ref; Official Gazette of the United States Patent Office, Vol 918, No 2, p 577, January 8, 1974.

Descriptors: *Patents, *Fish passages, Dams, *Fish ladders, Conveyance structures, Fish migration.
Identifiers: *Fish escalators.

A fish elevator or escalator is designed to provide a means whereby fish may be passed through, over or around a dam. The elevator has a pair of parallel tubular passageways having one set of identical corresponding transverse dimensions and a second set of different corresponding dimensions. Endless chains are arranged in parallel

reaches with one reach extending along the midpoint of the adjacent side of one of the passageways and the other reach of the chain extending midway along the adjacent side of the other passageway. Corresponding reaches of the chains have partitions secured between them. The partitions are mounted so as to be slightly oscillatable and held in tight sliding engagement with the associated passageways. The elevator works somewhat in the manner of an undershot waterwheel with means provided to admit fish to be elevated to the higher level or lowered to the lower level into the compartments between adjacent partitions. Available from NTIS as COM 73-11195 PC$4.50 microfiche $1.45. Archives Series Report No. 23, Prepared for NOAA, Office of Sea Grant, May 1973. 135 p. NOAA A/DC-1.

Descriptors: *Bibliographies, *Sanitary engineering, *Naval architecture, *Hydraulic engineering, *Water resources, *Desalination, Oceanography.

This compilation lists titles in those series related to ocean and water resources engineering which have been published in the College of Engineering, University of California, Berkeley, over the past thrity years. The compilation is arranged in sections according to office or laboratory from which the series emanated; arrangement within each section is sequential based on series report number. Separate author and subject indexes are provided. The offices and laboratories are identified as: Institute of Engineering Research, Sanitary Engineering Research Laboratory, Hydraulic Engineering Laboratory, Sea Water Conversion Laboratory, Naval Architecture, Committee on Ocean Engineering, and Waste Heat Management. 10D. Specialized Information Center Services

WATER RESOURCES TECHNICAL INFORMATION SERVICES.
Australian Water Resources Council, Canberra. Hydrological Series No 7, 1973. 69 p, 11 fig, 5 tab, 59 ref, 4 append.

Descriptors: *Information exchange, *Abstracts, *Australia, Information retrieval, Libraries, Publications, Documentation.
Identifiers: *Information centers.

The methods by which water resources technical information is disseminated in Australia and other countries were surveyed to establish the extent of the need for improvement of technical information services. The level of service provided by libraries in the water industry in Australia is low. This is the result of an inadequate number of professionally qualified librarians, an inadequate number of nonprofessional library personnel, and a low level of expenditure on library acquisitions and services. In general there is either a lack of recognition of the importance of scientific and technical information or a lack of understanding that a good library is an essential part of the means by which the information is obtained. Water libraries generally report to management at a level too low to be effective. It is proposed that a comprehensive information dissemination system be set up under the Australian Water Resources Council; the Council would be advised by a permanent committee on information services. A national water resources information center should coordinate the flow of information by the regular undexing of all documents acquired by the libraries in the system, act as a referral center for data, maintain information on current water research in Australia, and provide retrospective search and current awareness services. (Knapp-USGS)

10F. Preparation Of Reviews

WATER QUALITY CRITERIA, SECOND EDITION.
California State Water Resources Control Board, Sacramento.
For primary bibliographic entry see Field 05A.
W74-05417

SUBJECT INDEX

2

The Effects of Selected Herbicides on Bacterial Populations in an Aquatic Environment,
W74-05484 5C

2 4 5-T

The Persistence and Movement of Picloram and 2,4,5-T in Soils,
W74-05459 5B

ABRASION

Abrasion in Place: A Mechanism for Rounding and Size Reduction of Coarse Sediments in Rivers,
W74-05721 2J

ABSTRACTS

Water Resources Technical Information Services.
W74-05739 10D

ACCRETION

Burke V. Colley (Quiet Title Action Involving Accretion).
W74-05787 6E

ACCUMULATORS (OIL)

Oil Accumulator,
W74-05688 5G

ACETYLCHOLINESTERASE

Acetylcholinesterase Toxicity of Malathion and Its Metabolites,
W74-05466 5C

ACETYLENE REDUCTION

Nitrogen Fixation in a Subarctic Mire,
W74-05489 5B

ACID MINE WATER

The Microbiology of Acid Mine Water Treatment in Packed Bed Columns,
W74-05409 5D

ACIDITY

Neutron Irradiation of Mercury in Polyethylene Containers,
W74-05476 5A

ACOUSTICS

Computer Analysis of Oblique Acoustic Reflection for Ocean Sediment Identification,
W74-05697 2J

ACTIVATED CARBON

Process for Recovering Forest Product Plant Wastes,
W74-05900 5D

ACTIVATED CHARCOAL

Water Purification Apparatus and Cartridge Therefor,
W74-05895 5F

ACTIVATED SLUDGE

Inositol Polyphosphates in Activated Sludge,
W74-05467 5B

A Mathematical Model for Aerobic Digestion,
W74-05856 5D

ATP Pools in Activated Sludge,
W74-05914 5D

ADENOSINE TRIPHOSPHATE

ATP Pools in Activated Sludge,
W74-05914 5D

ADMINISTRATION

Public Water Supply Systems.
W74-05606 6E

Water Management and the Environment.
W74-05625 6G

A Bill to Authorize a Program to Develop and Demonstrate Low-Cost Means of Preventing Shoreline Erosion.
W74-05747 6E

Natural Areas Preservation.

Ground Water in the Kansas River Valley, Junction City to Kansas City, Kansas,
W74-05848 4B

ALTERATION OF FLOW
Augmenting Water Supplies of the Volga River and Diverting Part of the Runoff of Northern Rivers Southward (O povyshenii vodoobespechennosti r. Volgi i perebroske chasti stoka severnykh rek na yug),
W74-05836 3B

ALTERNATIVE PLANNING
Alternative Water Resource Systems in the Lower Mekong,
W74-05733 6A

ALTERNATIVE WATER USE
Water Allocation Models Based on an Analysis for the Kissimmee River Basin,
W74-05402 6B

An Analytical Interdisciplinary Evaluation of the Utilization of the Water Resources of the Rio Grande in New Mexico: Middle Rio Grande Region,
W74-05408 6B

AMERICAN PLAICE
Summer Storage of Energy and Its Use For Winter Metabolism and Gonad Maturation in American Plaice (Hippoglossoides platessoides),
W74-05463 2L

AMERICAN SAMOA (PALA LAGOON)
Primary Productivity in a Nutrient-Limited Tropical Estuary,
W74-05939 5C

AMPHIDINIUM-CARTERI
Biological Activity of a Cell Extract from the Dinoflagellate, Amphidinium carteri,
W74-05744 5C

ANADROMOUS FISH
Food of Larval Sea Lamprey (Petromyzon marinus) and American Brook Lamprey (Lampetra lamottei),
W74-05915 2I

ANAEROBIC CONDITIONS
Water Reclamation-Algae Production,
W74-05892 5D

ANALYTICAL TECHNIQUES
Ultrasonic Solubilization Technique for Use in Coulometry,
W74-05497 5A

Analytical Procedures for the Control of Disinfectants in Water Treatment,
W74-05511 5F

ANIONIC ELECTROPHORESIS
Anionic Electrophoretic Pattern of Five Ruthenium Salts in Fresh and Sea Water: Effects of Aging and Dilution,
W74-05479 5A

ANIONIC SURFACTANTS
Surfactant-Selective Electrodes. Part I. An Improved Liquid Ion-Exchanger,
W74-05474 5A

ANODES
Ring-Disk Electrode Study of the Anodic Behavior of Gold in 0.2M Sulfuric Acid,
W74-05446 2K

ANODIC STRIPPING VOLTAMMETRY
The Determination of a Stability Constant for the Aqueous Complex Zn(OH)2 Using Anodic Stripping Voltammetry,
W74-05455 5A

ANTARCTIC
Rates of Quaternary Glacial Erosion and Corrie Formation, Marie Byrd Land, Antarctica,
W74-05717 2J

ANTICHOLINESTERASES
Semiautomated Method for More Precise and Sensitive Determination of Nonpolar Anticholinesterase Insecticides with Technicon Modules,
W74-05496 5A

AQUATIC ALGAE
Algae in the Spoon River, Illinois 1971-1972,

BRACHIOMONAS SUBMARINA
An Investigation of the Effects of DDT and Other Chlorinated Hydrocarbons on the Growth of Euryhaline Microalgae,
W74-05407 5C

BRACKISH WATER
Highly Mineralized Groundwater and Its Utilization (Podzemnyye vody povyshennoy mineralizatsii i ikh ispol'zovaniye),
W74-05565 3A

BRANCHIURAN PARASITE
Occurrence of the Parasitic Branchiuran, Argulus alosae, On Dying Atlantic Menhaden, Brevoortia tyrannus, In the Connecticut River,
W74-05526 5C

BRAZIL
Long-Distance Telemetry of Data for Flood Forecasting,
W74-05859 4A

BREAKERS
A Wave and Current Investigation in the Nearshore Zone,
W74-05699 2L

BREAKWATERS
Designs for Rubble-Mound Breakwater Repairs Nawiliwili Harbor, Nawiliwili, Hawaii. Hydraulic Model Investigation,
W74-05705 8B

Design of Quadripod Cover Layers for Rubble-Mound Breakwaters. Hydraulic Laboratory Investigation,
W74-05709 8B

BRIDGES
Two-Dimensional Analysis of Backwater at Bridges,
W74-05734 2E

BRINES
An Additional Location of Metalliferous Sediments in the Red Sea,
W74-05554 2J

Natural Chloride Pollution, Arkansas and Red River Basins,
W74-05742 5B

BROMOSUCCINIMIDE
Microdetermination of Thiocyanates with N-Bromosuccinimide Using Bordeaux Red as an Indicator,
W74-05443 5A

BROOK LAMPREY
Food of Larval Sea Lamprey (Petromyzon marinus) and American Brook Lamprey (Lampetra lamottei),
W74-05915 2I

BUBBLE SCREENS
Mixing of Salinity-Stratified Water by Pneumatic Barriers. Report I: Preliminary Investigations. Hydraulic Model Investigation,
W74-05701 2L

BUBBLES
Mass Transfer in Heterogeneous Systems and Velocity and Gas Absorption Studies for Single Bubbles,
W74-05413 5B

Aerobic Sewage Treatment,
W74-05896 5D

BULKHEADS
Location and Design of Wave Absorber, Gary Harbor, Indiana. Hydraulic Model Investigation,
W74-05706 8B

BY-PASS PIPING
Optimal Planning for a Thermal Discharge Treatment System,
W74-05933 5D

CACODYLIC ACID
Determination of Cacodylic Acid (Hydroxydimethylarsine Oxide) by Gas Chromatography,
W74-05448 5A

CADMIUM
A Preliminary Procedure for the Determination of Cadmium in Blood,
W74-05445 5A

A Simultaneous Determination of Zinc and Cadmium,
W74-05477 5A

CALCIUM CARBONATE
Nitrogen Transformations in Sediments as Affected by Chemical Amendments,
W74-05485 5B

CALIFORNIA
Final Environmental Statement Related to Operation of San Onofre Nuclear Generating Station Unit 1, Southern Californai Edison Company and the San Diego Gas and Electric Company.
W74-05424 5C

Base of Fresh Ground Water--Approximately 3,000 Micromhos--in the Sacramento Valley and Sacremento-San Joaquin Delta, California,
W74-05553 7C

Regulations Concerning Waste Discharge Requirements, National Pollutant Discharge Elimination System.
W74-05777 5G

New Melones Lake, Stanislaus River, California (Final Environmental Impact Statement).
W74-05810 4A

Potential Danger from the Indian Catfish, Heteropneustes fossilis (Bloch),
W74-05829 8I

A Review of Wastewater Problems and Wastewater Management Planning in the San Francisco Bay Region, California.,
W74-05863 5D

CANADA
Occurrence, Radioactivity, and Diversity, of Winnipeg River Benthic Organisms in the Vicinity of Whiteshell Nuclear Research Establishment,
W74-05418 5C

Flocculation of Suspended Sediment in the Sea,
W74-05441 5B

Water Release from the Base of Active Glaciers,
W74-05728 2C

Flushing of Coastal Embayments by Changes in Atmospheric Conditions,
W74-05730 2L

Airborne Measurement of Snow-Water Equivalent Using Natural Gamma Radiation Over Southern Ontario, 1972-1973,
W74-05853 2C

Area-Of-Origin Protectionism in Western Waters,
W74-05854 6B

CANADA (CHAR LAKE-MERETTA LAKE)
Bacterial Dynamics in Two High-Arctic Lakes,
W74-05458 5C

CANADA (ST
Summer Storage of Energy and Its Use For Winter Metabolism and Gonad Maturation in American Plaice (Hippoglossoides platessoides),
W74-05463 2L

CANALS (UPLAND)
Fishes, Macroinvertebrates, and Hydrological Conditions of Uplands Canals in Tampa Bay, Florida,
W74-05916 5C

CANCER (FISH LIVER)
Morphological Changes in the Liver of Fish (Lebistes reticulatus) During Administration of Diethyl and Dimethylnitrosamines (In Russian),
W74-05940 5C

CAPITAL
A Useful Theorem in the Dynamic Programming Solution of Sequencing and Scheduling Problems Occurring in Capital Expenditure Planning,
W74-05935 6B

CAPITAL IMPROVEMENTS
Regional Water and Sewer Capital Improvements Program.
W74-05874 5D

CARBON DIOXIDE
Measurement of the Apparent Dissociation Constants of Carbonic Acid in Seawater at Atmospheric Pressure,
W74-05731 2K

CARBONIC ACID
Measurement of the Apparent Dissociation Constants of Carbonic Acid in Seawater at Atmospheric Pressure,
W74-05731 2K

CARDIO VASCULAR DRUGS
Biological Activity of a Cell Extract from the Dinoflagellate, Amphidinium carteri,
W74-05744 5C

CASPIAN SEA
Experimental Study of the Effect of Oil on Some Representatives of Benthos in the Caspian Sea,
W74-05440 5C

CATFISH HANDLING
Potential Danger from the Indian Catfish, Heteropneustes fossilis (Bloch),
W74-05829 8I

CATIONIC SURFACTANTS
Separation and Analysis of Mixtures of Cationic Surface-Active Agents by Salting-Out Chromatography,
W74-05481 2K

CENTRIFUGATION
Decanting Centrifuge for Draining Off Water from Sewage Sludge,
W74-05899 5D

CERIUM SULFATE
Photometric Determination of Diphenylamine with Cerium(IV) Sulphate,
W74-05478 5A

CHANNEL BEDS
Form and Fluvial Processes in Alluvial Stream Channels,
W74-05819 2E

CHANNEL CATFISH
Enzyme and Tissue Alterations in Fishes: A Measure of Water Quality,
W74-05540 5C

CHANNEL IMPROVEMENT
Effects of Urbanization on Stream Channels and Stream Flow,
W74-05534 4C

Nivigation Improvements in Barnhart Island-Corwall Island Reach, St. Lawrence River: Hydraulic Model Investigation,
W74-05712 8B

CHANNEL MORPHOLOGY
Metamorphosis of a River--A Comparison of the Mississippi River Before and After Cutoffs,
W74-05414 2E

Hydromorphology of Alluvial Channels of Lowland Rivers and Tidal Estuaries,
W74-05547 2J

Form and Fluvial Processes in Alluvial Stream Channels,
W74-05819 2E

CHANNELING
Effects of Dredge and Fill Activities in the Cocohatchee River,
W74-05571 5C

CHANNELS
Houstonhannel, Galveston Bay, Texas: Report 1--Hydraulic and Salinity Verification,
W74-05531 8B

The Detection of Subsurface Stream Channels in Carbonate Rocks by Geoelectrical Methods,
W74-05541 2F

CHEMICAL ANALYSIS
Spectrophotometric Determination of Uranium(VI) with 7-Chloro-8-Hydroxyquinoline-5-Sulphonic Acid,
W74-05442 5A

A Simultaneous Determination of Zinc and Cadmium,
W74-05477 5A

Photometric Determination of Diphenylamine with Cerium(IV) Sulphate,
W74-05478 5A

Anionic Electrophoretic Pattern of Five Ruthenium Salts in Fresh and Sea Water: Effects of Aging and Dilution,
W74-05479 5A

An Improved Ion-Exchange Technique for the Concentration of Manganese From Sea Water,
W74-05506 5A

CHEMICAL INDUSTRY
Costs of Water Pollution Control in the Chemical Industry,
W74-05642 5D

CHEMICAL OXYGEN DEMAND
Diffusion of Cattle Manure Solution Through a Wet Porous Stratum with Reaction,
W74-05591 5B

CHEMICAL TREATMENT
Water Clarification Process Using Silicon-Containing Aminomethyl Phosphonates,
W74-05890 5D

Waste Treatment System,
W74-05898 5D

CHEMICAL WASTES
Method and System for the Containment and Salvage of Chemicals and Oils at Sea,
W74-05908 5G

CHINA
Hydromorphology of Alluvial Channels of Lowland Rivers and Tidal Estuaries,
W74-05547 2J

CHIPPEWA NATIONAL FOREST (MINN)
Evaluation of Peatland Water Table Elevation and Water Quality Indicators,
W74-05517 7B

Forest Vegetation Classification and Management,
W74-05518 7B

CHLORIDES
Gold Twin-Electrodes in Thin-Layer Electrochemistry,
W74-05475 2K

Ultrasonic Solubilization Technique for Use in Coulometry,
W74-05497 5A

Natural Chloride Pollution, Arkansas and Re River Basins,
W74-05742 5

CHLORIDOMETER
Determination of Potassium by Means of th Cotlove Chloridometer,
W74-05450 5

CHLORINATED HYDROCARBON PESTICIDE
An Investigation of the Effects of DDT ar Other Chlorinated Hydrocarbons on th Growth of Euryhaline Microalgae,
W74-05407 5

CHLORINATED SOLVENTS
Conservation of Water and Reduction of Poll tion by Use of Solvent Systems for Colorir Textile Materials: An Economic Outlook,
W74-05535 3

CHLORINATION
Chlorine: Its Development, Characteristics ar Utility for Disinfection and Oxidation,
W74-05508 5

Feeding, Handling and Storage of Chlorine,
W74-05509 5

Analytical Procedures for the Control of Disi fectants in Water Treatment,
W74-05511 5

Disinfection and Oxidation of Domest Wastes,
W74-05512 5

Auxiliary Uses of Disinfection Oxidizir Agents in Water Treatment,
W74-05514 5

CHLORINE
Chlorine: Its Development, Characteristics ar Utility for Disinfection and Oxidation,
W74-05508 5

Feeding, Handling and Storage of Chlorine,
W74-05509 5

Disinfection and Oxidation of Domest Wastes,
W74-05512 5

CHLORINITY RATIOS
Temporal and Depth Study of Alkaline Ear Chlorinity Ratios in Seawater at a Single St tion South of Puerto Rico,
W74-05457 5

CHLOROPHYLL
Trend Sulface Analysis and Seasonal Distribu tion Patterns of Primary Nutrients an Chlorophyll in Unstratified Gulf Coast Estu ries,
W74-05488 5

CHLOROPHYTA
Algae in the Spoon River, Illinois 1971-1972,
W74-05483 5

A Study of Water-Soluble Inhibitory Con pounds (Algicides) Produced by Fresh-Wat Algae,
W74-05537 5

CHROMATOGRAPHY
A New Benzene-Ethanol-Water Solvei System for TLC Separation of Aflatoxins,
W74-05436 5

An Automatic Sample Loader for Colum Chromatography,
W74-05438 5

Metaperiodate - A New Structure-Specific Locating Reagent for Phenolic Compounds,
W74-05439 5A

A Useful Spray Reagent to Differentiate Common Phenolic Compounds on Thin-Layer Plates and Paper Chromatograms,
W74-05460 5A

Inositol Polyphosphates in Activated Sludge,
W74-05467 5B

Separation and Analysis of Mixtures of Cationic Surface-Active Agents by Salting-Out Chromatography,
W74-05481 2K

Thin-Layer Chromatography of Metal Chelates. Part II. An Extended Theory and Its Testing on Metal Dithizonates and Metal Diethyldithiocarbamates,
W74-05500 5A

HROMIUM
The Extraction-Spectrophotometric Determination of Chromium (III) with 4-(2-Pyridylazo)-Resorcinol,
W74-05470 5A

HROMOGENIC REAGENTS
Metaperiodate - A New Structure-Specific Locating Reagent for Phenolic Compounds,
W74-05439 5A

Spectrophotometric Determination of Uranium(VI) with 7-Chloro-8-Hydroxyquinoline-5-Sulphonic Acid,
W74-05442 5A

A Useful Spray Reagent to Differentiate Common Phenolic Compounds on Thin-Layer Plates and Paper Chromatograms,
W74-05460 5A

HRYSOPHYTA
Algae in the Spoon River, Illinois 1971-1972,
W74-05483 5B

IRCULATION
Marine Studies of San Pedro Bay, California. Part I: Circulation Patterns in Los Angeles-Long Beach Harbor Drogue Study Atlas and Data Report,
W74-05708 2L

IRQUES
Rates of Quaternary Glacial Erosion and Corrie Formation, Marie Byrd Land, Antarctica,
W74-05717 2J

ITIES
Public Service Districts for Water and Sewerage Services.
W74-05746 6E

Access to Public Municipal Beaches: The Formulation of a Comprehensive Legal Approach,
W74-05783 6E

LASSIFICATION
Forest Vegetation Classification and Management,
W74-05518 7B

Proposal for a Particle-Size Grade Scale Based on 10,
W74-05719 2J

LIMATE MANAGEMENT
Microclimate Management by Traditional Farmers,
W74-05452 3F

CLIMATIC DATA
Manual for Estimation of Probable Maximum Precipitation.
W74-05524 2B

Climatic Description of Dew in the European USSR,
W74-05839 2B

CLIMATOLOGY
Relationship Between Climatological Values of Air Temperature and Amount of Precipitation,
W74-05568 2B

COAL GASIFICATION
Staff Report on Coal Gasification: Processes and Effects,
W74-05416 5B

COAL MINES
Strip Mining: Partnership in Greed,
W74-05582 5C

COASTAL MARSHES
The Value of the Tidal Marsh,
W74-05782 2L

Can We Save Our Salt Marshes,
W74-05803 2L

Jack and the Dragline,
W74-05804 2L

COASTAL POLLUTION
Human Ecology and Coastal-Zone Pollution,
W74-05597 5G

COASTAL WATERS
Beach and Shore Preservation Act.
W74-05771 6E

Access to Public Municipal Beaches: The Formulation of a Comprehensive Legal Approach,
W74-05783 6E

Aquaculture: Problems with the Promise,
W74-05802 3F

Jack and the Dragline,
W74-05804 2L

COASTAL ZONE
The Structure of Management and Planning for the Coastal Zone,
W74-05702 2L

COASTAL ZONE MANAGEMENT
Pollution Management in the Coastal States,
W74-05655 6E

Compatibility of Petroleum Activities in the Coastal Zone,
W74-05656 6B

Can Coastal Resources Survive Development,

Ocean and Water Resources Engineering Reports College of Engineering University of California Berkeley.
W74-05707 10C

Method and Apparatus for Distilling Freshwater from Seawater,
W74-05901 3A

DESALINATION PROCESSES
Method of Making Sodium Chloride Concentrate from Sea Water,
W74-05887 3A

DESIGN
Optimal Design and Operation of Water Distribution Systems,
W74-05937 4A

DETECTION LIMITS
The Determination of Boron in Solution to Sub p.p.b. Concentrations by Hollow-Cathode Emission,
W74-05468 5A

DEUTERIUM
Cuases of Geographical Distribution of Oxygen-18 and Deuterium in Thermal Water of the Sayan-Baykal Mountains (Prichiny geograficheskogo raspredeleniya kisloroda-18 deyteriya v termal'nykh vodakh Sayano Baykal'skoy gornoy strany),
W74-05560 2K

DEVELOPMENT
Coastal Island Trusts.
W74-05762 6E

DEW
Climatic Description of Dew in the European USSR,
W74-05839 2B

Amount of Dew in the USSR, According to a Dew Recorder,
W74-05840 2B

DEW GAGES
Amount of Dew in the USSR, According to a Dew Recorder,
W74-05840 2B

DIATOMS
Food of Larval Sea Lamprey (Petromyzon marinus) and American Brook Lamprey (Lampetra lamottei),
W74-05915 2

DIELDRIN
An Investigation of the Effects of DDT and Other Chlorinated Hydrocarbons on the Growth of Euryhaline Microalgae,
W74-05407 5C

DIFFUSION
Diffusion of Cattle Manure Solution Through a Wet Porous Stratum with Reaction,
W74-05591 5B

The Mixing Characteristics of Summerged Multiple-Port Diffusers for Heated Effluents in Open Channel Flow,
W74-05821 5B

Three-Dimensional Turbulent Diffusion from Point Sources of Thermal Pollution in a Rectangular Open Channel,
W74-05823 5B

Diffusion and Dispersion in Open Channel Flow,
W74-05833 5B

DIGITAL COMPUTERS
National Weather Service River Forecast System, Forecast Procedures.
W74-05861 4A

DIKE
Smith v. Cruthis (Injunction to Prohibit Levee and to Recover for Crop Damage).
W74-05770 6E

DINO-FLAGELLATE
Biological Activity of a Cell Extract from the Dinoflagellate, Amphidinium carteri,
W74-05744 5C

DIPHENYLAMINE
Photometric Determination of Diphenylamine with Cerium(IV) Sulphate,
W74-05478 5A

DISCHARGE
Part 124--State Program Elements Necessary for Participation in the National Pollutant Discharge Elimination System.
W74-05573 5G

DISCHARGE (WATER)
Discharge Patterns in Two Crevasses of the Mississippi River Delta,
W74-05548 2L

DISEASE PREVENTION
Water Supply of the Population as a Social Factor in the Prevention of Intestinal Infections, (In Russian),
W74-05456 5F

DISINFECTION
Proceedings of Third Sanitary Engineering Conference, Disinfection and Chemical Oxidation in Water and Waste Treatment.
W74-05507 5F

The Germicidal Efficiency of Silver, Iodine and Quaternary Ammonium Compounds,

FLORIDA COASTAL ZONE MASTER PLAN
Florida's Rationale for Coastal Zone Manag ment,
W74-05657 6

FLORIDA (TAMPA BAY)
Fishes, Macroinvertebrates, and Hydrologic Conditions of Uplands Canals in Tampa Ba Florida,
W74-05916

FLOTSAM
Apparatus for Removing Oil and Other Floati Contaminants from a Moving Body of Water.
W74-05691

Apparatus for Removing Oil and Other Floating Contaminants from a Moving Body of Water,
W74-05881 5G

LOW AROUND OBJECTS
Flow-Induced Forces on Protruding Walls,
W74-05737 8B

LOW AUGMENTATION
Augmenting Water Supplies of the Volga River and Diverting Part of the Runoff of Northern Rivers Southward (O povyshenii vodoobespechennosti r. Volgi i perebroske chasti stoka severnykh rek na yug),
W74-05836 3B

LUID FLOW
Vortex Containment of Submerged Jet Discharge,
W74-05912 8B

LUORIDES
Influence of Hydrogen Fluoride Fumigation on the Water Economy of Soybean Plants,
W74-05838 3F

LUTE MARKS
Development of Flute-Mark Assemblages: 1. Evolution of Pairs of Defects,
W74-05726 2J

LUVIAL PROCESSES
Form and Fluvial Processes in Alluvial Stream Channels,
W74-05819 2E

OOD CHAINS
The Production of Particles in the Surface Waters of the Ocean with Particular Reference to the Sargasso Sea,
W74-05453 5B

Species Introduction in a Tropical Lake,
W74-05492 5C

OOD PROCESSING INDUSTRY
Some Ecological Effects of Discharged Sugar Mill Wastes on Marine Life Along the Hamakua Coast, Hawaii,
W74-05660 5C

Origins of Sugar Mill Discharges on the Hilo-Hamakua Coast and a Course of Action for Their Control,
W74-05661 5C

OOD WEBS
Species Introduction in a Tropical Lake,
W74-05492 5C

ORECASTING
Effects of Urbanization on Stream Channels and Stream Flow,
W74-05534 4C

Development of Prediction Relationships for Water Requirements with Irrigation Cooling,
W74-05539 3F

An Empirical Mathematical Model of an Interconnected Watershed System,
W74-05543 2A

Role of Models in Groundwater Management,
W74-05680 4B

Engineering and Geographical Problems in the Design and Operation of Large Lowland Reservoirs (Inzhenerno-geograficheskiye problemy proyektirovaniya i ekspluatatsii krupnykh ravninnykh vodokhranilishch).
W74-05845 4A

FOREIGN COUNTRIES
A Summary on Ground Water in the Han River Basin, Republic of Korea,
W74-05546 4B

FOREIGN FISHING
Foreign Fishing Off the Southeastern United States under the Currently Accepted Contiguous Sea Limitation,

Larch Plantations in the Forest Steppe Zone, (In Russian),
W74-05946 4A

LATERITES
Lateritic Deep Weathering of Granite,
W74-05929 2G

LAW OF THE SEA
An Overview of the July-August 1971 Preparatory Session of the Law of the Sea,
W74-05651 6E

Acceptability to the Fishing Industry of the Current U.S. Position on Fisheries. Article III - - Law of the Sea Conference -- 1973,
W74-05652 6E

Alternatives to the Current U.S. Position on Fisheries,
W74-05653 6E

LEACHING
Subsurface Asphalt Moisture Barriers in Sandy Soils,
W74-05412 4B

LEAD
Synergic Solvent Extraction of Divalent Cations with Decafluoroheptanedione and Di-n-Butylsulfoxide,
W74-05472 5A

Evolution of the Isotopic Composition of Lead in Ancient Marine Basins (K voprosu ob evolyutsii izotopnogo sostava svintsa v drevnikh morskikh basseynakh),
W74-05559 2F

LEAD RADIOISOTOPES
Evolution of the Isotopic Composition of Lead in Ancient Marine Basins (K voprosu ob evolyutsii izotopnogo sostava svintsa v drevnikh morskikh basseynakh),
W74-05559 2F

LEAF TEMPERATURES
Development of Prediction Relationships for Water Requirements with Irrigation Cooling,
W74-05539 3F

LEBISTES-RETICULATUS
Morphological Changes in the Liver of Fish (Lebistes reticulatus) During Administration of Diethyl and Dimethylnitrosamines (In Russian),
W74-05940 5C

LEGAL ASPECTS
State Wetlands.
W74-05611 6E

Construction, Reconstruction or Maintenance of Drains.
W74-05759 6E

City of Kings Montain v. Goforth (City Files Petition for Condemnation of Bottom Land and Condemnees Cross Complain for Destruction of Property Due to Flooding Caused by Dam).
W74-05760 6E

Environmental Law--Rivers and Harbors Appropriations Act--Private Persons May Not Sue in Qui Tam Without Explicit Grant of Permission for Citizen Suits.
W74-05763 6E

Waste Discharge Permits: No Defense to Water Pollution Actions,
W74-05764 5G

Applicability of Rule of Strict or Absolute Liability to Overflow or Escape of Water Caused by Dam Failure,
W74-05776 6E

American Waterways: Florida Oil Pollution Legislation Makes it Over First Hurdle,
W74-05778 5G

Access to Public Municipal Beaches: The Formulation of a Comprehensive Legal Approach,
W74-05783 6E

Who Governs Local Waters,
W74-05784 6E

Burke V. Colley (Quiet Title Action Involving Accretion).
W74-05787 6E

Custis Fishing and Hunting Club V. Johnson (Boundary Dispute as to Title to Bed of a Mill Pond).
W74-05790 6E

Drainage Code--Environmental Values.
W74-05796 6E

Environmental Law--Zoning--Ordinance Prohibiting Filling of Wetlands Adjacent to Navigable Waters, Without Permit is Constitutional Exercise of Police Power Not Requiring Compensation.
W74-05815 6E

Federal Common Law in Interstate Water Pollution Disputes,
W74-05816 5G

LEGAL CONSTRAINTS
Water Conveyance: Laws, Organization and Efficiency,
W74-05910 6E

LEGISLATION
Exploration, Production, or Transportation of Oil or Gas in Navigable Waters.
W74-05576 6E

A Bill Authorizing the Construction, Repair, and Preservation of Certain Public Works on Rivers and Harbors for Navigation, Flood Control, and for other Purposes.
W74-05592 6E

Protection of Water.
W74-05598 6E

Alterations in Watercourses and Lakes.
W74-05599 6E

Interference with Fish and Wildlife in Streams and Rivers.
W74-05600 6E

Polluting Streams.
W74-05601 6E

Water Quality and Effluent Standards.
W74-05607 6E

Polluting or Contaminating State Waters.
W74-05608 6E

Scenic Rivers.
W74-05610 6E

The Externalities of a Torrey Canyon Situation; an Impetus for Change in Legislation,
W74-05628 5G

An Overview of the July-August 1971 Preparatory Session of the Law of the Sea,
W74-05651 6E

Sewage Works of Municipal Corporations and Sanitary Districts,
W74-05745 6E

Public Service Districts for Water and Sewerage Services.
W74-05746 6E

Natural Areas Preservation.
W74-05748 6E

Unlawful Sewage Disposal.
W74-05749 6E

Construction, Reconstruction or Maintenance of Drains.
W74-05759 6E

A Bill to be Entitled an Act Relating to Coastal Zone Management.
W74-05761 6E

Environmental Law--Rivers and Harbors Appropriations Act--Private Persons May Not Sue in Qui Tam Without Explicit Grant of Permission for Citizen Suits.
W74-05763 6E

A Bill Amending the Public Health Service Act and the Federal Food, Drug, and Cosmetic Act in Order to Assure Safe Drinking Water.
W74-05767 6E

Water Pollution--Penalty Proceedings.
W74-05772 6E

Health-Municipal Water Treatment Plants.
W74-05773 6E

Champlain Basin Compact.
W74-05774 6E

Soil and Water Conservation--Flood Control.
W74-05775 6E

American Waterways: Florida Oil Pollution Legislation Makes it Over First Hurdle,
W74-05778 5G

No Fault Liability for Oil Pollution Damage,
W74-05779 5C

Highlights of the Federal Water Pollution Control Act of 1972,
W74-05780 5E

Penalties for Water Pollution.
W74-05797 6E

Big Cypress Conservation Act.
W74-05798 6E

Environmental Quality Annual Report (3rd) o the Council on Environmental Quality.
W74-05807 6C

LETHAL LIMIT
Water Quality Criteria, Second Edition.
W74-05417 5A

LEVEE
Smith v. Cruthis (Injunction to Prohibit Leve and to Recover for Crop Damage).
W74-05770 6E

LIABILITY
The Externalities of a Torrey Canyon Situa tion; an Impetus for Change in Legislation,
W74-05628 5C

LIMNOLOGY
Experimental Approaches to Limnology - A Overview,
W74-05498 5A

LINDANE
Chemical Confirmation of BHC Isomers: Com parison of Alkaline Reactions in Solution an by Gas Chromatographic Pre-Column,
W74-05494 5A

LIQUID CRYSTALS
Separation of Monosubstituted Phenol Isomer Using Liquid Crystals,
W74-05447 5A

LIQUID WASTES
Raw Liquid Waste Treatment System an Process,
W74-05692 5D

Liquid Aeration Method and Apparatus,
W74-05883 5D

Aerobic Sewage Treatment,
W74-05896 5D

Liquid Treatment Plant and Process, Particu larly for Waste Water,
W74-05906 5D

LITTORAL DRIFT
Littoral Drift Computations Along the Coast o Florida by Means of Ship Wave Observations.
W74-05710 2E

LOADS (FORCES)
Flow-Induced Forces on Protruding Walls,
W74-05737 8B

LOAM
Gamma Radiation for Measuring Water Con tents in Soil Columns with Changing Bulk Den sity,
W74-05930 2G

LOCAL GOVERNMENTS
Flood Problems in Certain Areas of th Hackensack River Basin; Saddle River Basin Passaic River Basin; and Pompton River Basin -State of New Jersey.
W74-05584 6B

Drainage.
W74-05754 6E

Water Resources Management.
W74-05756 6E

LONG ISLAND (NY)
The Water Table on Long Island, New York, in March 1970,
W74-05556 4B

LONG ISLAND SOUND
Sources and Movements of Water--An Interim Report.
W74-05415 2L

LONG-TERM PLANNING
International Impact Reports and the Conservation of the Ocean Environment,

Lake Charles Public Hearing Testimony.
W74-05786 2L

The Land Water Interface in an Urban Region: A Spatial and Temporal Analysis of the Nature and Significances of Conflicts Between Coastal Uses,
W74-05872 6B

Regional Water and Sewer Capital Improvements Program.
W74-05874 5D

Management of Storm Drainage and Flood Control Activities.
W74-05878 5D

Planning Manual for Storm Drainage and Flood Control.
W74-05879 5D

Multiple-Objective Optimization in Water Resource Systems,
W74-05936 6A

MANGANESE
An Improved Ion-Exchange Technique for the Concentration of Manganese From Sea Water,
W74-05506 5A

MANGANESE OXIDE
Adsorption of Hg(II) by Hydrous Manganese Oxides,
W74-05491 5A

MANGROVE
The Mangrove in New Zealand,
W74-05469 2I

MANGROVE SWAMPS
Effects of Dredge and Fill Activities in the Cocohatchee River,
W74-05571 5C

MANURE (CATTLE)
Diffusion of Cattle Manure Solution Through a Wet Porous Stratum with Reaction,
W74-05591 5B

MAPPING
Applications of Aerial Photography and ERTS Data to Agricultural, Forest and Water Resources Management.
W74-05515 7B

MAPS
Flood Hazard Analyses, Sand Creek, City of Colorado Springs, and El Paso County.
W74-05860 2E

MARIE BYRD LAND (ANTARCTICA)
Rates of Quaternary Glacial Erosion and Corrie Formation, Marie Byrd Land, Antarctica,
W74-05717 2J

MARINE ALGAE
Effect of Temperature Variations on Growth, Reproduction, Amino Acid Synthesis, Fat and Sugar Content in Ulva Fasciata Delile Plants,
W74-05499 5C

MARINE BIOLOGY
Some Ecological Effects of Discharged Sugar Mill Wastes on Marine Life Along the Hamakua Coast, Hawaii,
W74-05660 5C

MARINE ENVIRONMENT
The Interdependance of Marine and Estuarine Ecosystems in South Africa,
W74-05713 5B

MARINE FISHERIES
Acceptability to the Fishing Industry of the Current U.S. Position on Fisheries. Article III -- Law of the Sea Conference -- 1973,
W74-05652 6E

Alternatives to the Current U.S. Position on Fisheries,

State Wetlands.
W74-05611 6E

Sanitary Facilities Fund.
W74-05612 6E

Chemical Weathering of Serpentinite in the Eastern Piedmont of Maryland,
W74-05729 2J

MASS TRANSFER
Mass Transfer in Heterogeneous Systems and Velocity and Gas Absorption Studies for Single Bubbles,
W74-05413 5B

MASS WASTING
Slow Movement of Earth under Tropical Rain Forest Conditions,
W74-05724 2J

MATHEMATICAL MODEL
Population Growth, Resource Availability and Environmental Quality,
W74-05614 6B

MATHEMATICAL MODELS
Water Allocation Models Based on an Analysis for the Kissimmee River Basin,
W74-05402 6B

Response of River Water to Biochemically Degradable Substances in Pulp Mill Waste Water (Odezva reky na biochemicky odbouratelne latky v odpadnich vodach z celulozek),
W74-05431 5B

Thin-Layer Chromatography of Metal Chelates. Part II. An Extended Theory and Its Testing on Metal Dithizonates and Metal Diethyldithiocarbamates,
W74-05500 5A

An Empirical Mathematical Model of an Interconnected Watershed System,
W74-05543 2A

Diffusion of Cattle Manure Solution Through a Wet Porous Stratum with Reaction,
W74-05591 5B

An Operational Mathematical Programming Model for the Planning of Economic Activities in Relation to the Environment,
W74-05616 6B

Developing Simulation Models,
W74-05672 2A

Two-Dimensional Analysis of Backwater at Bridges,
W74-05734 2E

Water Exchange in Two-Layer Stratified Waters,
W74-05736 2L

Hydraulics and Thermal Dispersion in an Irregular Estuary,
W74-05828 5B

A Mathematical Model for Aerobic Digestion,
W74-05856 5D

MEANDERS
Form and Fluvial Processes in Alluvial Stream Channels,
W74-05819 2E

MEASUREMENT
Environmental Radiation Surveillance of the Oyster Creek Nuclear Generating Station.
W74-05430 5A

Methods of Measuring Soil Moisture,
W74-05557 2G

Results of Monitoring for Tritium Incorporation at the Karlsruhe Nuclear Research Center in 1971 and 1972, (Ergebnisse der Tritium-Inkorporationsuberwachung im Kernforschungszentrum Karlsruhe in den Jahren, 1971-1972),
W74-05613 5A

Estimate of the Accuracy of Determination of Snow Cover Characteristics and Recommendations on the Rationalization of the Snow Measurement Network,
W74-05844 2C

MERCURY
Neutron Irradiation of Mercury in Polyethylene Containers,
W74-05476 5A

Perhalobenzenesulfinates as Reagents in the Determination of Inorganic Mercury in Various Media by Gas-Liquid Chromatography,
W74-05482 5A

Adsorption of Hg(II) by Hydrous Manganese Oxides,
W74-05491 5A

MERCURY COMPOUNDS
Removal of Mercury Compounds from Water,
W74-05684 5D

METABOLITES
Acetylcholinesterase Toxicity of Malathion and Its Metabolites,
W74-05466 5C

METAL CHELATES
The Spectrophotometry and Solvent-Extraction Behaviour of Iron(III), Vanadium(IV and V) and Titanium(IV) Chelates of 1-(o-Carboxyphenyl)-3-Hydroxy-3-Methyltriazene,
W74-05471 5A

Thin-Layer Chromatography of Metal Chelates. Part II. An Extended Theory and Its Testing on Metal Dithizonates and Metal Diethyldithiocarbamates,
W74-05500 5A

METAL COMPLEXES
Determination of Cyanide in its Platinum and Palladium Complexes,
W74-05449 5A

METALS
Metal Coordination Compounds of Thiabendazole,
W74-05490 5A

METAPERIODATE
Metaperiodate - A New Structure-Specific Locating Reagent for Phenolic Compounds,
W74-05439 5A

METEOROLOGY
Relationship Between Climatological Values of Air Temperature and Amount of Precipitation,

Method for Suppressing the Formation of Ice in Natural or Man-Made Bodies of Water,
W74-05689 2C

Improved Process for Treatment of Aqueous Suspensions,
W74-05690 5D

Apparatus for Removing Oil and Other Floating Contaminants from a Moving Body of Water,
W74-05691 5G

Raw Liquid Waste Treatment System and Process,
W74-05692 5D

Determination of Sulfate Using Ferric Ion-Selective Electrode,
W74-05693 5A

Method for Making a Hollow Fiber Separatory Element,
W74-05694 3A

Apparatus for Removing Oil and Other Floating Contaminants from a Moving Body of Water,
W74-05881 5G

Liquid Aeration Method and Apparatus,
W74-05883 5D

Dispersed Growth Biological Sewage Treatment Process,
W74-05884 5D

Apparatus and Method for Removing Solids from Liquids,
W74-05885 5D

Oil Recovery System,
W74-05886 5G

Method of Making Sodium Chloride Concentrate from Sea Water,
W74-05887 3A

Dynamically Effective Oil-Guide-Boom and Method for Purifying Water Employing the Same,
W74-05888 5G

Waste Treatment Apparatus,
W74-05889 5D

Water Clarification Process Using Silicon-Containing Aminomethyl Phosphonates,
W74-05890 5D

Water Treatment,
W74-05891 5D

Water Reclamation-Algae Production,
W74-05892 5D

Vortex Oil-Water Separator System Providing Clean Water,
W74-05893 5G

Vortex Oil-Water Separator System Providing Clean Water,
W74-05894 5G

Water Purification Apparatus and Cartridge Therefor,
W74-05895 5F

Aerobic Sewage Treatment,
W74-05896 5D

PATENTS

Method for Separating Oil from a Mixture of Oil and Waste Water from an Offshore Rig,
W74-05897 5G

Waste Treatment System,
W74-05898 5D

Decanting Centrifuge for Draining Off Water from Sewage Sludge,
W74-05899 5D

Process for Recovering Forest Product Plant Wastes,
W74-05900 5D

Method and Apparatus for Distilling Freshwater from Seawater,
W74-05901 3A

Convertible Barrier for Substances Floating on Water,
W74-05902 5G

Fish Escalator,
W74-05903 8I

Ozonating Apparatus for Drinking Water,
W74-05904 5F

Waste and Water Treatment System,
W74-05905 5D

Liquid Treatment Plant and Process, Particularly for Waste Water,
W74-05906 5D

Method and Apparatus for Mixing Gases with Water,
W74-05907 5F

Method and System for the Containment and Salvage of Chemicals and Oils at Sea,
W74-05908 5G

Oxygen Analyzer,
W74-05909 5A

Irrigation System,
W74-05928 3F

PATH OF POLLUTANTS

Nitrogen Uptake Efficiency by Four Plant Species in the Field and Growth Chamber,
W74-05404 5B

Response of River Water to Biochemically Degradable Substances in Pulp Mill Waste Water (Odezva reky na biochemicky odbouratelne latky v odpadnich vodach z celulozek),
W74-05431 5B

The Persistence and Movement of Picloram and 2,4,5-T in Soils,
W74-05459 5B

Transport, Fate and Geochemical Interactions of Mercury, Cadmium and other Inorganic Pollutants in the Coastal Littoral-Salt Marsh Environment of the Southeastern United States.
W74-05501 5B

Heavy Metal Fluxes Through Salt Marsh Estuaries,
W74-05502 5B

Organic and Inorganic Geochemistry of Some Coastal Plain Rivers of the Southeastern United States,
W74-05503 5B

Chemical Characteristics of Dissolved Organic Matter in River Water,
W74-05504 5B

Movement of Nitrates Under Irrigated Agriculture,
W74-05666 5B

Three-Dimensional Turbulent Diffusion from Point Sources of Thermal Pollution in a Rectangular Open Channel,
W74-05823 5B

Hydraulics and Thermal Dispersion in an Irregular Estuary,
W74-05828 5B

Longitudinal Dispersion in Saturated Porous Media,
W74-05832 5B

Diffusion and Dispersion in Open Channel Flow,
W74-05833 5B

PATH POLLUTANTS

The Mixing Characteristics of Summerged Multiple-Port Diffusers for Heated Effluents in Open Channel Flow,
W74-05821 5B

PEAK DISCHARGE

Urban Flood Frequency Characteristics,
W74-05738 2E

The Estimation of Flood Flows from Natural Catchments,
W74-05850 4A

PEAT

Evaluation of Peatland Water Table Elevation and Water Quality Indicators,
W74-05517 7B

Effect of Water-Table Height on Root Development of Pinus contorta on Deep Peat in Scotland,
W74-05617 2I

PENALTIES (LEGAL)

Unlawful Sewage Disposal.
W74-05749 6E

Penalties for Water Pollution.
W74-05797 6E

PENGUINS

A Double Marine Disaster,
W74-05800 5B

PENNSYLVANIA

Final Environmental Statement Related to the Proposed Limerick Generating Station, Units 1 and 2, Philadelphia Electric Company.
W74-05425 5C

Guidelines for Dealing with Floods on Hay Creek.

W74-05873 5D

PERKIOMEN CREEK (PENN)

Final Environmental Statement Related to the Proposed Limerick Generating Station, Units 1 and 2, Philadelphia Electric Company.
W74-05425 5C

PERMAFROST

Nitrogen Fixation in a Subarctic Mire,
W74-05489 5B

PERMEATION

Permeation of Uncharged Organic Molecules and Water Through Tomato Roots,
W74-05852 3F

PERMITS

Part 124--State Program Elements Necessary for Participation in the National Pollutant Discharge Elimination System.
W74-05573 5G

Protection of Water.
W74-05598 6E

Polluting or Contaminating State Waters.
W74-05608 6E

County Control of Dam Construction.
W74-05768 6E

Regulations Concerning Waste Discharge Requirements, National Pollutant Discharge Elimination System.
W74-05777 5G

Highlights of the Federal Water Pollution Control Act of 1972,
W74-05780 5E

Hamilton V. Diamond (Proceeding seeking to have Permit to Fill Hudson River at Certain Address Declared Illegal and Void).
W74-05789 6E

PESTICIDE KINETICS

Conversion of Some Organo-Phosphorus Insecticides on Adsorbing Surfaces as Affected by Formulation,
W74-05435 5B

The Persistence and Movement of Picloram and 2,4,5-T in Soils,
W74-05459 5B

PESTICIDE RESIDUES

Chemical Confirmation of BHC Isomers: Comparison of Alkaline Reactions in Solution and by Gas Chromatographic Pre-Column,
W74-05494 5A

PESTICIDE TOXICITY

Acetylcholinesterase Toxicity of Malathion and Its Metabolites,
W74-05466 5C

PESTICIDES

Water Quality Criteria, Second Edition.
W74-05417 5A

Ultrasonic Solubilization Technique for Use in Coulometry,
W74-05497 5A

PHENOLS

Metaperiodate - A New Structure-Specific Locating Reagent for Phenolic Compounds,
W74-05439 5A

A Useful Spray Reagent to Differentiate Common Phenolic Compounds on Thin-Layer Plates and Paper Chromatograms,
W74-05460 5A

PHENYLUREAS

Gas Chromatography of Substituted Phenylureas by Flash-Heater Methylation with Trimethylanilinium Hydroxide,
W74-05480 5A

PHOSPHATES
Inositol Polyphosphates in Activated Sludge,
W74-05467 5B

Determination of the Rate of Tripoly- and Pyro-Phosphate Hydrolysis in Sediments,
W74-05542 5A

PHOSPHORUS COMPOUNDS
Inositol Polyphosphates in Activated Sludge,
W74-05467 5B

PHOTOGRAPHY
Effectiveness of Sequential Photography for Coastal Oceanography,
W74-05711 2L

PHOTOOXIDATION
Interference of Non-Hydrocarbons in Oil-In-Water Determination,
W74-05462 5A

The Application of Photo-Oxidation to the Determination of Stable Cobalt in Sea Water,
W74-05473 5A

PHOTOSYNTHETIC RATES
Effects of Sedimentation of the Algal Flora of a Small Recreational Impoundment,
W74-05486 5C

PHYTOMASS PRODUCTION
Changes of Soil Humidity and Its Correlation to Phytomass Production in Sandy Meadow Associations,
W74-05949 2G

PHYTOPLANKTON
Bacterial Dynamics in Two High-Arctic Lakes,
W74-05458 5C

Primary Productivity in a Nutrient-Limited Tropical Estuary,
W74-05939 5C

PICLORAM
The Persistence and Movement of Picloram and 2,4,5-T in Soils,
W74-05459 5B

PINE
The Actual Evapotranspiration of Four Forest Stands in the East of France, (In French),
W74-05942 2D

PINE TREES
Effect of Water-Table Height on Root Development of Pinus contorta on Deep Peat in Scotland,
W74-05617 2I

PIPE FLOW
Self-Closing Irrigation Pipe Valve,
W74-05670 8B

Turbulence in Wakes of Roughness Elements,
W74-05826 8B

PISCIVORES
Species Introduction in a Tropical Lake,
W74-05492 5C

PLANNING
A Selected Annotated Bibliography on the Analysis of Water Resource Systems, Fourth Volume.
W74-05401 6A

Effects of Urbanization on Stream Channels and Stream Flow,
W74-05534 4C

Environmental Impact and Water Development,
W74-05619 6G

Biological Management and Conservation: Ecological Theory, Application and Planning,
W74-05622 6G

75 Water Assessment. Draft Plan of Study.
W74-05626 6B

Lafayette Public Hearing Testimony.
W74-05785 2L

Lake Charles Public Hearing Testimony.
W74-05786 2L

Hamilton V. Diamond (Proceeding seeking to have Permit to Fill Hudson River at Certain Address Declared Illegal and Void).
W74-05789 6E

Master Planning Methodology for Urban Drainage,
W74-05834 6A

A Useful Theorem in the Dynamic Programming Solution of Sequencing and Scheduling Problems Occurring in Capital Expenditure Planning,
W74-05935 6B

Multiple-Objective Optimization in Water Resource Systems,
W74-05936 6A

PLANT DISEASES
Forest Disease Detection and Control,
W74-05516 7B

Corn Defoliation Surveys,
W74-05520 7B

Alfalfa Crop Productivity Analysis,
W74-05521 7B

PLANT GROWTH REGULATORS
A Study of Water-Soluble Inhibitory Compounds (Algicides) Produced by Fresh-Water Algae,
W74-05537 5C

PLANT PATHOLOGY
Applications of Aerial Photography and ERTS Data to Agricultural, Forest and Water Resources Management.
W74-05515 7B

PLANT PHYSIOLOGY
Effect of Temperature Variations on Growth, Reproduction, Amino Acid Synthesis, Fat and Sugar Content in Ulva Fasciata Delile Plants,
W74-05499 5C

PLANT ROT
Forest Disease Detection and Control,
W74-05516 7B

PLASTICS
Neutron Irradiation of Mercury in Polyethylene Containers,
W74-05476 5A

PLATINUM
Determination of Cyanide in its Platinum and Palladium Complexes,
W74-05449 5A

PLATYMONAS SUBCORDIFORMIS
An Investigation of the Effects of DDT and Other Chlorinated Hydrocarbons on the Growth of Euryhaline Microalgae,
W74-05407 5C

PLEISTOCENE EPOCH
Late Quaternary Sedimentation in the Active Eastern Aleutian Trench,
W74-05720 2J

PLUMBING
Water and Sewer Needs of Low Income Families for the Mid-Cumberland Region of Tennessee.
W74-05870 5D

PNEUMATIC SCREEN
Mixing of Salinity-Stratified Water by Pneumatic Barriers. Report I: Preliminary Investigations. Hydraulic Model Investigation,
W74-05701 2L

POJOAQUE VALLEY (NEW MEXICO)
Preliminary Feasibility Study for the Pojoaque Valley Sewerage System.
W74-05875 5D

POLAROGRAPHIC ANALYSIS
The Application of Photo-Oxidation to the Determination of Stable Cobalt in Sea Water,
W74-05473 5A

POLITICAL ASPECTS
Will Success Spoil NEPA,
W74-05750 6E

POLITICAL CONSTRAINTS
Area-Of-Origin Protectionism in Western Waters,
W74-05854 6B

POLLUTANT IDENTIFICATION
Investigations of Freshwater Surface Microlayers,
W74-05410 5A

A Study of the Stability of a Nitrogen-Selective Thermionic Detector,
W74-05437 5A

Metaperiodate - A New Structure-Specific Locating Reagent for Phenolic Compounds,
W74-05439 5A

Microdetermination of Thiocyanates with N-Bromosuccinimide Using Bordeaux Red as an Indicator,
W74-05443 5A

The Determination of Barium by Flameless Atomic Absorption Spectrophotometry Using a Modified Graphite Tube Atomizer,
W74-05444 5A

A Preliminary Procedure for the Determination of Cadmium in Blood,
W74-05445 5A

Separation of Monosubstituted Phenol Isomers Using Liquid Crystals,
W74-05447 5A

Determination of Cacodylic Acid (Hydroxydimethylarsine Oxide) by Gas Chromatography,
W74-05448 5A

Determination of Cyanide in its Platinum and Palladium Complexes,
W74-05449 5A

Determination of Potassium by Means of the Cotlove Chloridometer,
W74-05450 5A

Novel Method for Sampling Oil Spills and for Measuring Infrared Spectra of Oil Samples,
W74-05451 5A

POLLUTANT IDENTIFICATION

A Useful Spray Reagent to Differentiate Common Phenolic Compounds on Thin-Layer Plates and Paper Chromatograms,
W74-05460 5A

Inositol Polyphosphates in Activated Sludge,
W74-05467 5B

A Simultaneous Determination of Zinc and Cadmium,
W74-05477 5A

Photometric Determination of Diphenylamine with Cerium(IV) Sulphate,
W74-05478 5A

Perhalobenzenesulfinates as Reagents in the Determination of Inorganic Mercury in Various Media by Gas-Liquid Chromatography,
W74-05482 5A

Chemical Confirmation of BHC Isomers: Comparison of Alkaline Reactions in Solution and by Gas Chromatographic Pre-Column,
W74-05494 5A

Gas-Liquid Chromatographic Determination of Rotenone and Deguelin in Plant Extracts and Commercial Insecticides,
W74-05495 5A

Semiautomated Method for More Precise and Sensitive Determination of Nonpolar Anticholinesterase Insecticides with Technicon Modules,
W74-05496 5A

Determination of Sulfate Using Ferric Ion-Selective Electrode,
W74-05693 5A

POLLUTANTS

Part 124--State Program Elements Necessary for Participation in the National Pollutant Discharge Elimination System.
W74-05573 5G

Marina Del Rey: Computer Simulation of Pollutant Transport in Semi-Enclosed Water Body,
W74-05698 5B

Pollution Control Agency.
W74-05757 6E

The Spreading and Transport of Oil Slicks on the Open Ocean in the Presence of Wind, Waves, and Currents,
W74-05919 5B

POLLUTION ABATEMENT

Population Growth, Resource Availability and Environmental Quality,
W74-05614 6B

Analysis of Economic Impacts of Environmental Standards on the Bakery Industry, Part I, Executive Summary.
W74-05623 5G

The Proceedings of a National Symposium on Costs of Water Pollution Control.
W74-05629 5G

Economic Implications of Alternative National Goals,
W74-05631 5G

Pollution Control Policy and the Efficient Allocation of Resources,
W74-05637 5G

Economic Growth Vs. Environmental Protection: What Will be the Outcome,
W74-05644 6C

Pollution Management in the Coastal States,
W74-05655 6E

Origins of Sugar Mill Discharges on the Hilo-Hamakua Coast and a Course of Action for Their Control,
W74-05661 5C

Oil Accumulator,
W74-05688 5G

Apparatus for Removing Oil and Other Floating Contaminants from a Moving Body of Water,
W74-05691 5G

No Fault Liability for Oil Pollution Damage,
W74-05779 5G

Federal Common Law in Interstate Water Pollution Disputes,
W74-05816 5G

Apparatus for Removing Oil and Other Floating Contaminants from a Moving Body of Water,
W74-05881 5G

Apparatus and Method for Removing Solids from Liquids,
W74-05885 5D

Oil Recovery System,
W74-05886 5G

Dynamically Effective Oil-Guide-Boom and Method for Purifying Water Employing the Same,
W74-05888 5G

Vortex Oil-Water Separator System Providing Clean Water,
W74-05893 5G

Vortex Oil-Water Separator System Providing Clean Water,
W74-05894 5G

Method for Separating Oil from a Mixture of Oil and Waste Water from an Offshore Rig,
W74-05897 5G

Convertible Barrier for Substances Floating on Water,
W74-05902 5G

Method and System for the Containment and Salvage of Chemicals and Oils at Sea,
W74-05908 5G

POLLUTION CONTROL

Polluting Streams.
W74-05601 6E

American Waterways: Florida Oil Pollution Legislation Makes it Over First Hurdle,
W74-05778 5G

No Fault Liability for Oil Pollution Damage,
W74-05779 5G

Highlights of the Federal Water Pollution Control Act of 1972,
W74-05780 5E

International Impact Reports and the Conservation of the Ocean Environment,
W74-05781 5G

Federal Common Law in Interstate Water Pollution Disputes,
W74-05816 5G

POLLUTION TAXES (CHARGES)

Economic Incentives in Water Pollution Control,
W74-05638 5G

Water and Wastewater Surcharges as Economic Incentives,
W74-05639 5G

POLYPHOSPHATES

Determination of the Rate of Tripoly- and Pyro-Phosphate Hydrolysis in Sediments,
W74-05542 5A

POPULATION

Population Growth, Resource Availability and Environmental Quality,
W74-05614 6B

POROUS MEDIA

Longitudinal Dispersion in Saturated Porous Media,
W74-05832 5B

POROUS PAVEMENTS

Investigation of Porous Pavements for Urban Runoff Control,
W74-05411 5D

PORPHYRA DISEASES

Diseases of the Cultivated Porphyra at Culture Beds with Special Reference to the Effects of Fertilizer Plant Effluents (In Korean),
W74-05618 5C

PORPHYRIDIUM SP

An Investigation of the Effects of DDT and Other Chlorinated Hydrocarbons on the Growth of Euryhaline Microalgae,
W74-05407 5C

PORT AREAS

Restructuring of River Banks and Secondary Pollution: Study of Eutrophications in Port Areas, (In French),
W74-05950 5C

PORT STANLEY TILL (CAN)

Water Release from the Base of Active Glaciers,
W74-05728 2C

POTABLE WATER

A Bill Amending the Public Health Service Act and the Federal Food, Drug, and Cosmetic Act in Order to Assure Safe Drinking Water.
W74-05767 6E

Ozonating Apparatus for Drinking Water,
W74-05904 5F

POTASSIUM

Determination of Potassium by Means of the Cotlove Chloridometer,
W74-05450 5A

A Survey of Stomatal Movements and Associated Potassium Fluxes in the Plant Kingdom,
W74-05769 2I

POTATO WASTES

Biological Treatment of Water Used in Potato Chip Manufacture, With Yeasts, (In French),
W74-05944 5D

POWER PLANTS

Energy Production and Environmental Consequences,
W74-05645 5C

PRAIRIES

Water-Leachable Nutrients from Frozen or Dried Prairie Vegetation,
W74-05696 5B

PRAWNS
Aquaculture: Problems with the Promise,
W74-05802 3F

PRECIPITATION (ATMOSPHERIC)
Description of Precipitation Cycles in the USSR and Their Relation to General Circulation Cycles,
W74-05566 2B

Relationship Between Climatological Values of Air Temperature and Amount of Precipitation,
W74-05568 2B

Problem of Determining Precipitation Falling on Mountain Slopes,
W74-05843 2B

PRECIPITATION EXCESS
Evaporation, Infiltration and Rainfall-Runoff Processes in Urban Watersheds,
W74-05405 2A

PRECIPITATION INTENSITY
Manual for Estimation of Probable Maximum Precipitation.
W74-05524 2B

PREDATION
Species Introduction in a Tropical Lake,
W74-05492 5C

PRESSURE VESSELS
Water Treatment,
W74-05891 5D

PRESSURIZED WATER REACTORS
Final Environmental Statement Related to Operation of R. E. Ginna Nuclear Power Plant Unit I, Rochester Gas and Electric Corporation.
W74-05422 5C

Final Environmental Statement Related to the Proposed Catawba Nuclear Station, Units 1 and 2, Duke Power Company.
W74-05423 5C

Final Environmental Statement Related to Operation of San Onofre Nuclear Generating Station Unit 1, Southern Californai Edison Company and the San Diego Gas and Electric Company.
W74-05424 5C

PRIMARY PRODUCTIVITY
The Production of Particles in the Surface Waters of the Ocean with Particular Reference to the Sargasso Sea,
W74-05453 5B

Primary Productivity in a Nutrient-Limited Tropical Estuary,
W74-05939 5C

PRIOR APPROPRIATION
Water-Management Problems Related to Groundwater Rights in the Southwest,
W74-05683 4B

Water Conveyance: Laws, Organization and Efficiency,
W74-05910 6E

PROBABILITY
Optimum Reservoir Operating Policies and the Imposition of a Reliability Constraint,
W74-05934 4A

PROBABLE MAXIMUM PRECIPITATION
Manual for Estimation of Probable Maximum Precipitation.
W74-05524 2B

PROCESS IDENTIFICATION
ATP Pools in Activated Sludge,
W74-05914 5D

PROFIT
Economics of Aquaculture Development,
W74-05646 6C

PROJECT PLANNING
Life of the Land V. Brinegar (Action to Enjoin Seaward Runway for Airport).
W74-05593 6E

Management of Storm Drainage and Flood Control Activities.
W74-05878 5D

PROJECT PURPOSES
A Bill Authorizing the Construction, Repair, and Preservation of Certain Public Works on Rivers and Harbors for Navigation, Flood Control, and for other Purposes.
W74-05592 6E

Life of the Land V. Brinegar (Action to Enjoin Seaward Runway for Airport).
W74-05593 6E

Water Resources Management.
W74-05756 6E

PROJECTIONS
Land Use Trends and the Future of Agriculture in the North Atlantic Region,
W74-05682 6D

PROPRIETORY POWER
Natural Areas Preservation.

The Role of Soil Water in the Hydrologic Behavior of Upland Basins,
W74-05913 2G

SOIL-WATER-PLANT RELATIONSHIPS
Estimation Procedures for Response Functions of Crops to Soil Water Content and Salinity,
W74-05678 3F

SOILS
Soil Characteristics in the Shallow Aquatoria, (In Russian),
W74-05948 2G

SOLID WASTES
Assessment of the Loss of Radioactive Isotopes from Waste Solids to the Environment. Part 1: Background and Theory,
W74-05419 5B

SOLVENT EXTRACTIONS
The Extraction-Spectrophotometric Determination of Chromium (III) with 4-(2-Pyridylazo)-Resorcinol,
W74-05470 5A

The Spectrophotometry and Solvent-Extraction Behaviour of Iron(III), Vanadium(IV and V) and Titanium(IV) Chelates of 1-(o-Carboxyphenyl)-3-Hydroxy-3-Methyltriazene,
W74-05471 5A

Synergic Solvent Extraction of Divalent Cations with Decafluoroheptanedione and Di-n-Butylsulfoxide,
W74-05472 5A

SOLVENT SYSTEMS
A New Benzene-Ethanol-Water Solvent System for TLC Separation of Aflatoxins,
W74-05436 5A

SOLVENTS
Conservation of Water and Reduction of Pollution by Use of Solvent Systems for Coloring Textile Materials: An Economic Outlook,
W74-05535 3E

SORGHUM
Water-Use Efficiency and Its Relation to Crop Canopy Area, Stomatal Regulation and Root Distribution,
W74-05621 3F

SOUNDS
Sources and Movements of Water--An Interim Report.
W74-05415 2L

SOUTH AFRICA (CAPE AGULHAS)
A Double Marine Disaster,
W74-05800 5B

SOUTH AFRICA (NATAL)
The Interdependance of Marine and Estuarine Ecosystems in South Africa,
W74-05713 5B

SOUTH CAROLINA
Final Environmental Statement Related to the Proposed Catawba Nuclear Station, Units 1 and 2, Duke Power Company.
W74-05423 5C

A Hydrographic Investigation of Winyah Bay, South Carolina and the Adjacent Coastal Waters,
W74-05505 2L

Water Table and Soil Moisture Probabilities With Tile Drainage,
W74-05677 2G

SOUTH DAKOTA
Water-Leachable Nutrients from Frozen or Dried Prairie Vegetation,
W74-05696 5B

SOUTHEAST U
Transport, Fate and Geochemical Interactions of Mercury, Cadmium and other Inorganic Pollutants in the Coastal Littoral-Salt Marsh Environment of the Southeastern United States.
W74-05501 5B

Proposed Chattooga National Wild and Scenic River, North Carolina, South Carolina, and Georgia (Final Environmental Impact Statement).
W74-05805 5G

SOUTHWEST U
Water-Management Problems Related to Groundwater Rights in the Southwest,
W74-05683 4B

SOYBEAN
Influence of Hydrogen Fluoride Fumigation on the Water Economy of Soybean Plants,
W74-05838 3F

SOYBEANS
Water-Use Efficiency and Its Relation to Crop Canopy Area, Stomatal Regulation and Root Distribution,
W74-05621 3F

SPECIES DIVERSITY INDEX
Algae in the Spoon River, Illinois 1971-1972,
W74-05483 5B

SPECTRAL ANALYSIS
Spectral Analysis and Its Application to Hydrologic Time Series of Lower Ohio Tributaries,
W74-05820 2A

SPECTROPHOTOMETRY
Spectrophotometric Determination of Uranium(VI) with 7-Chloro-8-Hydroxyquinoline-5-Sulphonic Acid,
W74-05442 5A

The Determination of Barium by Flameless Atomic Absorption Spectrophotometry Using a Modified Graphite Tube Atomizer,
W74-05444 5A

A Preliminary Procedure for the Determination of Cadmium in Blood,
W74-05445 5A

Novel Method for Sampling Oil Spills and for Measuring Infrared Spectra of Oil Samples,
W74-05451 5A

The Extraction-Spectrophotometric Determination of Chromium (III) with 4-(2-Pyridylazo)-Resorcinol,
W74-05470 5A

The Spectrophotometry and Solvent-Extraction Behaviour of Iron(III), Vanadium(IV and V and Titanium(IV) Chelates of 1-(o-Carboxyphenyl)-3-Hydroxy-3-Methyltriazene,
W74-05471 5A

A Simultaneous Determination of Zinc and Cadmium,
W74-05477 5A

Photometric Determination of Diphenylamine with Cerium(IV) Sulphate,
W74-05478 5A

SPECTROSCOPY
The Determination of Boron in Solution to Sub-p.p.b. Concentrations by Hollow-Cathode Emission,
W74-05468 5A

SPOIL BANKS
Norfolk Harbor Disposal Study: Hydrogeologic Study of Nansemond City Disposal Area.
W74-05847 5B

SPOON RIVER (ILL
Algae in the Spoon River, Illinois 1971-1972,
W74-05483 5B

SPRINKLER IRRIGATION
Subsurface Distribution of Nonuniformly Applied Surface Waters,
W74-05671 3F

An Economic Analysis of Alternative Sprinkler Irrigation Distribution Systems on the Southern High Plains of Texas,
W74-05924 3F

SPRUCE
The Actual Evapotranspiration of Four Forest Stands in the East of France, (In French),
W74-05942 2D

ST
Environmental Quality Planning - Goals, Policies, and Objectives.
W74-05876 6B

ST GEORGE'S CHANNEL
Caesium-137 as a Water Movement Tracer in the St George's Channel,
W74-05555 2E

STABILITY CONSTANTS
The Determination of a Stability Constant for the Aqueous Complex Zn(OH)2 Using Anodic Stripping Voltammetry,
W74-05455 5A

STANDARDS
Highlights of the Federal Water Pollution Control Act of 1972,
W74-05780 5E

STANDING CROPS
Effects of Sedimentation of the Algal Flora of a Small Recreational Impoundment,
W74-05486 5C

'ATE GOVERNMENTS
Part 124--State Program Elements Necessary for Participation in the National Pollutant Discharge Elimination System.
W74-05573 5G

State Wetlands.
W74-05611 6E

State-Federal Management Initiative,
W74-05659 6E

Big Cypress Conservation Act.
W74-05798 6E

'ATISTICAL METHODS
A Factor Analysis of Selected Water Quality Variables in Central New Jersey During 1960-1969,
W74-05716 5B

'ATUTES
Will Success Spoil NEPA,
W74-05750 6E

Public Service Companies--Cooking Gas and Water Service.
W74-05799 6E

'EEL
Industry Variance of Consumer Prices and Competition as a Consequence of Water Pollution Abatement,
W74-05640 5D

'OCHASTIC PROCESSES
A Stochastic Study on the Concentration Process of Radioactive Substances to Aquatic Organisms,
W74-05429 5B

Spectral Analysis and Its Application to Hydrologic Time Series of Lower Ohio Tributaries,
W74-05820 2A

Optimum Reservoir Operating Policies and the Imposition of a Reliability Constraint,
W74-05934 4A

Modeling the Regulation of Lake Superior Under Uncertainty of Future Water Supplies,
W74-05938 4A

'OMATA
Some Evidence of Stomatal Restriction of Evaporation From Well-Watered Plant Canopies,
W74-05662 2D

'OMATAL
Water-Use Efficiency and Its Relation to Crop Canopy Area, Stomatal Regulation and Root Distribution,
W74-05621 3F

'OMATAL MOVEMENT
A Survey of Stomatal Movements and Associated Potassium Fluxes in the Plant Kingdom,
W74-05769 2I

'ORM DRAINS
Management of Storm Drainage and Flood Control Activities.
W74-05878 5D

Planning Manual for Storm Drainage and Flood Control.
W74-05879 5D

Feasibility of Combined Solid Waste and Storm Drainage Projects.
W74-05880 4A

STORM RUNOFF
Urban Flood Frequency Characteristics,
W74-05738 2E

The Role of Soil Water in the Hydrologic Behavior of Upland Basins,
W74-05913 2G

STORM SEWERS
Investigation of Porous Pavements for Urban Runoff Control,
W74-05411 5D

STORMFLOW SOURCE AREAS
The Role of Soil Water in the Hydrologic Behavior of Upland Basins,
W74-05913 2G

STRATIFICATION
Mixing of Salinity-Stratified Water by Pneumatic Barriers. Report I: Preliminary Investigations. Hydraulic Model Investigation,
W74-05701 2L

Distribution and Mixing of Inflow into Stratified Lakes: A Hydraulic Model Study,
W74-05917 2H

STRATIFIED FLOW
Water Exchange in Two-Layer Stratified Waters,
W74-05736 2L

Hydrodynamical Stability of Salt Wedge,
W74-05825 2L

STREAM GAGES
Annual Compilation and Analysis of Hydrologic Data for Deep Creek, Colorado River Basin, Texas, 1971,
W74-05851 2E

STREAMBEDS
Form and Fluvial Processes in Alluvial Stream Channels,
W74-05819 2E

STREAMFLOW
Effects of Urbanization on Stream Channels and Stream Flow,
W74-05534 4C

City of Kings Montain v. Goforth (City Files Petition for Condemnation of Bottom Land and Condemnees Cross Complain for Destruction of Property Due to Flooding Caused by Dam).
W74-05760 6E

Sediment Transport at Low Shields-Parameter Values,
W74-05835 2J

Augmenting Water Supplies of the Volga River and Diverting Part of the Runoff of Northern Rivers Southward (O povyshenii vodoobespechennosti r. Volgi i perebroske chasti stoka severnykh rek na yug),
W74-05836 3B

STREAMFLOW FORECASTING
National Weather Service River Forecast System, Forecast Procedures.
W74-05861 4A

STREAMS
Polluting Streams.
W74-05601 6E

STRESS ANALYSIS
Hydraulic Fracturing in Zoned Earth and Rockfill Dams,
W74-05855 8D

STRIP MINE WASTES
Strip Mining: Partnership in Greed,
W74-05582 5C

STRIP MINES
Strip Mining: Partnership in Greed,
W74-05582 5C

SUBMARINE CANYONS
Drowned and Buried Valleys on the Southern New England Continental Shelf,
W74-05549 2J

SUBMERGED JETS
Vortex Containment of Submerged Jet Discharge,
W74-05912 8B

SUBSTRATE UTILIZATION
The kinetics of Yeast Growth on Pure Hydrocarbons,
W74-05493 5B

SUBSURFACE DRAINAGE
Water Table and Soil Moisture Probabilities With Tile Drainage,
W74-05677 2G

SUBSURFACE FLOW
A Multiphase Model for Infiltration (Modele d' Infiltration Polyphasique),
W74-05911 2G

The Role of Soil Water in the Hydrologic Behavior of Upland Basins,
W74-05913 2G

SUBSURFACE INVESTIGATIONS
The Detection of Subsurface Stream Channels in Carbonate Rocks by Geoelectrical Methods,
W74-05541 2F

SUBSURFACE IRRIGATION
Irrigation System,
W74-05928 3F

SUGAR MILL WASTES
Origins of Sugar Mill Discharges on the Hilo-Hamakua Coast and a Course of Action for Their Control,
W74-05661 5C

SUGARCANE
Origins of Sugar Mill Discharges on the Hilo-Hamakua Coast and a Course of Action for Their Control,
W74-05661 5C

SULFATE IONS
Determination of Sulfate Using Ferric Ion-Selective Electrode,
W74-05693 5A

SULFIDES
Removal of Mercury Compounds from Water,
W74-05684 5D

SULFITE LIQUORS
Reduction of Pollutants in Effluents (Umen'shenie postupayushchikh v stok zagryaznenii),
W74-05432 5B

SULFONATES
Surfactant-Selective Electrodes. Part I. An Improved Liquid Ion-Exchanger,
W74-05474 5A

SULFUR COMPOUNDS
Surfactant-Selective Electrodes. Part I. An Improved Liquid Ion-Exchanger,
W74-05474 5A

SUNFLOWER
Elemental Composition and Response to Nitrogen of Sunflower and Corn,
W74-05703 3F

SUPERVISORY CONTROL
Sewage Works of Municipal Corporations and Sanitary Districts,
W74-05745 6E

SURCHARGE
Water and Wastewater Surcharges as Economic Incentives,
W74-05639 5G

SURF
A Wave and Current Investigation in the Nearshore Zone,
W74-05699 2L

SURFACE DRAINAGE
Little Running Water Ditch Watershed Protection, Flood Prevention, and Land Drainage RC and D Measure Plan (Final Environmental Statement).
W74-05806 4D

SURFACE-GROUNDWATER RELATIONSHIPS
An Analytical Interdisciplinary Evaluation of the Utilization of the Water Resources of the Rio Grande in New Mexico: Middle Rio Grande Region,
W74-05408 6B

Surface-Groundwater Relationships in Central Mongolia (Vzaimosvyaz' poverkhnostnykh i gruntovykh vod v Tsentral'noy Mongolii),
W74-05561 2A

Groundwater Resources of Central Asia (Resursy gruntovykh vod Tsentral'noy Azii),
W74-05562 2F

Role of Models in Groundwater Management,
W74-05680 4B

SURFACE IRRIGATION
Volume Balance Method for Computing Infiltration Rates in Surface Irrigation,
W74-05674 3F

Recession Flow in Surface Irrigation,
W74-05679 4A

Shape Factors in Irrigation Water Advance Equation,
W74-05681 3F

SURFACE MICROLAYERS
Investigations of Freshwater Surface Microlayers,
W74-05410 5A

SURFACE RUNOFF
Recession Flow in Surface Irrigation,
W74-05679 4A

Smith v. Cruthis (Injunction to Prohibit Levee and to Recover for Crop Damage).
W74-05770 6E

SURFACE WATERS
Surface-Groundwater Relationships in Central Mongolia (Vzaimosvyaz' poverkhnostnykh i gruntovykh vod v Tsentral'noy Mongolii),
W74-05561 2A

City of Kings Montain v. Goforth (City Files Petition for Condemnation of Bottom Land and Condemnees Cross Complain for Destruction of Property Due to Flooding Caused by Dam).
W74-05760 6E

SURFACTANT SELECTIVE ELECTRODES
Surfactant-Selective Electrodes. Part I. An Improved Liquid Ion-Exchanger,
W74-05474 5A

SURFACTANTS
Mass Transfer in Heterogeneous Systems and Velocity and Gas Absorption Studies for Single Bubbles,
W74-05413 5B

Surfactant-Selective Electrodes. Part I. An Improved Liquid Ion-Exchanger,
W74-05474 5A

Separation and Analysis of Mixtures of Cationic Surface-Active Agents by Salting-Out Chromatography,
W74-05481 2K

SURVEILLANCE
Foreign Fishing Off the Southeastern United States under the Currently Accepted Contiguous Sea Limitation,
W74-05654 6E

SURVEY
Environmental Radiation Surveillance of the Oyster Creek Nuclear Generating Station.
W74-05430 5A

SURVEYS
Burke V. Colley (Quiet Title Action Involving Accretion).
W74-05787 6E

River-Ice Problems: A State-of-the-Art Survey and Assessment of Research Needs.
W74-05824 2C

SUSPENDED SOLIDS
Reduction of Pollutants in Effluents (Umen'shenie postupayushchikh v stok zagryaznenii),
W74-05432 5B

Waste and Water Treatment System,
W74-05905 5D

SWEDEN (LAPPLAND)
Nitrogen Fixation in a Subarctic Mire,
W74-05489 5B

SYNTHESIS
Methane Formation by Lake Sediments During in Vitro Incubation,
W74-05487 5B

SYSTEMS ANALYSIS
A Selected Annotated Bibliography on the Analysis of Water Resource Systems, Fourth Volume.
W74-05401 6A

Some Remarks on Aquaculture,
W74-05647 6C

Developing Simulation Models,
W74-05672 2A

Planning Manual for Storm Drainage and Flood Control.
W74-05879 5D

TASTE
Ozonating Apparatus for Drinking Water,
W74-05904 5F

TELEMETRY
Long-Distance Telemetry of Data for Flood Forecasting,
W74-05859 4A

TEMPERATURE
Effects of pH and Temperature on the Fatt Acid Composition of Bacillus Acidocaldarius,
W74-05461 5(

TEMPORAL DISTRIBUTION
Temporal and Depth Study of Alkaline Eart Chlorinity Ratios in Seawater at a Single Sta tion South of Puerto Rico,
W74-05457 5I

TENNESSEE
Natural Areas Preservation.
W74-05748 6I

Water and Sewer Needs of Low Income Fam lies for the Mid-Cumberland Region of Tennes see.
W74-05870 5I

TENSIOMETERS
Tensiometer-Pressure Transducer System fo Studying Unsteady Flow Through Soils,
W74-05668 2(

TEXAS
Trend Sulface Analysis and Seasonal Distribu tion Patterns of Primary Nutrients an Chlorophyll in Unstratified Gulf Coast Estua ries,
W74-05488 5I

Ground-Water Data for Harris County, Texas Volume II--Records of Wells, 1892-1972,
W74-05527 4I

Ground-Water Data for Harris County, Texas Volume III--Chemical Analyses of Water fror Wells, 1922-71,
W74-05528 4I

The Occurrence and Distribution of th Hydroids of the Galveston Bay, Texas, Area,

Houstonhannel, Galveston Bay, Texas: Repo. 1--Hydraulic and Salinity Verification,
W74-05531 8I

Sierra Club V. Lynn (Action Challenging EI Which Found Community Project would nc Pollute Water Reservoir).
W74-05577 6I

Urban Flood Frequency Characteristics,
W74-05738 2I

Construction of Wastewater Facilities, Lufkir Texas (Final Environmental Impact Statement
W74-05814 5I

Annual Compilation and Analysis of Hydrolog ic Data for Deep Creek, Colorado River Basir Texas, 1971,
W74-05851 2I

An Economic Analysis of Alternative Sprinkle Irrigation Distribution Systems on the Souther High Plains of Texas,
W74-05924 3I

TEXTILES
Conservation of Water and Reduction of Pollu tion by Use of Solvent Systems for Colorin Textile Materials: An Economic Outlook,
W74-05535 3I

Industry Variance of Consumer Prices an Competition as a Consequence of Water Pollu tion Abatement,
W74-05640 5I

THEORETICAL ANALYSIS
A Useful Theorem in the Dynamic Programming Solution of Sequencing and Scheduling Problems Occurring in Capital Expenditure Planning,
W74-05935 6B

THERMAL POLLUTION
Staff Report on Coal Gasification: Processes and Effects,
W74-05416 5B

Characteristics of Condenser Water Discharge on the Sea Surface (Correlation of Field Observations with Theory),
W74-05700 5A

The Mixing Characteristics of Summerged Multiple-Port Diffusers for Heated Effluents in Open Channel Flow,
W74-05821 5B

Vertical Mixing of Heated Effluents in Open-Channel Flow,
W74-05822 5B

Three-Dimensional Turbulent Diffusion from Point Sources of Thermal Pollution in a Rectangular Open Channel,
W74-05823 5B

Hydraulics and Thermal Dispersion in an Irregular Estuary,
W74-05828 5B

Optimal Planning for a Thermal Discharge Treatment System,
W74-05933 5D

THERMAL REGIME
Reservoir Storage and the Thermal Regime of Rivers, with Special Reference to the River Lune, Yorkshire,
W74-05464 4A

THERMAL STRESS
Effect of Temperature Variations on Growth, Reproduction, Amino Acid Synthesis, Fat and Sugar Content in Ulva Fasciata Delile Plants,
W74-05499 5C

THERMAL WATER
Cuases of Geographical Distribution of Oxygen-18 and Deuterium in Thermal Water of the Sayan-Baykal Mountains (Prichiny geograficheskogo raspredeleniya kisloroda-18 i deyteriya v termal'nykh vodakh Sayano-Baykal'skoy gornoy strany),
W74-05560 2K

THERMIONIC DETECTOR
A Study of the Stability of a Nitrogen-Selective Thermionic Detector,
W74-05437 5A

THIABENDAZOLE
Metal Coordination Compounds of Thiabendazole,
W74-05490 5A

THIN LAYER CHROMATOGRAPHY
A Useful Spray Reagent to Differentiate Common Phenolic Compounds on Thin-Layer Plates and Paper Chromatograms,
W74-05460 5A

Thin-Layer Chromatography of Metal Chelates. Part II. An Extended Theory and Its Testing on Metal Dithizonates and Metal Diethyldithiocarbamates,
W74-05500 5A

THIOBACILLUS FERROOXIDANS
The Microbiology of Acid Mine Water Treatment in Packed Bed Columns,
W74-05409 5D

THIOCYANATES
Microdetermination of Thiocyanates with N-Bromosuccinimide Using Bordeaux Red as an Indicator,
W74-05443 5A

TIDAL FLUSHING
Marina Del Rey: Computer Simulation of Pollutant Transport in Semi-Enclosed Water Body,
W74-05698 5B

TIDAL MARSHES
The Value of the Tidal Marsh,
W74-05782 2L

TIDES
Marina Del Rey: Computer Simulation of Pollutant Transport in Semi-Enclosed Water Body,
W74-05698 5B

TILE DRAINAGE
Water Table and Soil Moisture Probabilities With Tile Drainage,
W74-05677 2G

TILL
Water Release from the Base of Active Glaciers,
W74-05728 2C

TIME SENSING
Effectiveness of Sequential Photography for Coastal Oceanography,
W74-05711 2L

TIME SERIES ANALYSIS
Spectral Analysis and Its Application to Hydrologic Time Series of Lower Ohio Tributaries,
W74-05820 2A

Climatic Description of Dew in the European USSR,
W74-05839 2B

TISZA RIVER
Changes of Soil Humidity and Its Correlation to Phytomass Production in Sandy Meadow Associations,
W74-05949 2G

TITANIUM
The Spectrophotometry and Solvent-Extraction Behaviour of Iron(III), Vanadium(IV and V) and Titanium(IV) Chelates of 1-(o-Carboxyphenyl)-3-Hydroxy-3-Methyltriazene,
W74-05471 5A

TOMATO ROOTS
Permeation of Uncharged Organic Molecules and Water Through Tomato Roots,
W74-05852 3F

TONAL PATTERNS
Effectiveness of Sequential Photography for Coastal Oceanography,
W74-05711 2L

TOXICITY
Water Quality Criteria, Second Edition.
W74-05417 5A

Experimental Study of the Effect of Oil on Some Representatives of Benthos in the Caspian Sea,
W74-05440 5C

Enzyme and Tissue Alterations in Fishes: A Measure of Water Quality,
W74-05540 5C

TRACE ELEMENTS
An Additional Location of Metalliferous Sediments in the Red Sea,
W74-05554 2J

TRACERS
Caesium-137 as a Water Movement Tracer in the St George's Channel,
W74-05555 2E

TRANSPIRATION
Influence of Hydrogen Fluoride Fumigation on the Water Economy of Soybean Plants,
W74-05838 3F

TREATMENT FACILITIES
Industrial Experience with Pneumatic-Mechanical Aerators (Obyt primeneniya pnevmomekhanicheskikh aeratorov v proizvodstvennykh usloviyakh),
